NOVEMBER 1, 2, 3.—A very attractive exhibition of Chrysanthemums took place in the Queen's Hall on the above date, and the quality of some of the blooms grown in the East End came as a surprise to many of the visitors. The majority of the competitive plants and flowers came from the Victoria Park, Stepney, Bow, and surrounding districts, the group of Japanese and incurved shown by Mr. T. Smith was highly creditable; Mr. G. Heathcote being a close 2nd. In the class for a smaller group, Mr. C. J. Froud was a good 1st. Incurved varieties were praiseworthy as cut blooms, but outshone by the Japanese, which are better developed in the East End than the older type. Colour was wanting in some of the Japanese, but substance and fulness characterised them. The most favoured spot is the Sewardstone Road; the gardens in the houses at one side of the road back on to the canal, and beyond that is Victoria Park. Groups and collections of plants other than Chrysanthemums were invited, and they included considerable variety; the two leading subjects, and shown in very fine character, were Ficus elastica and Aspidistra lurida and its variegated form. This is an admirable town plant, and the highest award in the miscellaneous class was awarded to two large variegated specimens from Mr. C. Balls. Ferns, Fern-cases, Aralia Sieboldi, Dracænas of the green type, Begonia rex, &c., were also staged. Vegetables and fruits were invited, and some very creditable drawings of plants and flowers came from children. On the previous Saturday, greenhouses and window-boxes were inspected, a day being occupied in visiting them, many were of a homely character, but it was remarkable what excellent plants were grown in them, and as many as fifteen prizes were awarded. The judges recommended that for the future the greenhouse competition should be grouped into districts, some of them being much more favourable to plant growth than others. The exhibition was made quite extensive by the addition of valuable groups of plants from the Messrs. de Rothschild, Gunnersbury Park, Acton; F. A. Bevan, Esq., Trent Park, Barnet; S. B. Boulton, Esq., Copped Hall, Totteridge; Messrs. W. Cutbush & Sons, nurserymen, Highgate; Mr. Holmes, Frampton Park Nursery, Hackney; A. F. Hills, Esq., Woodford Green; Chrysanthemum blooms from C. E. Shea, Esq., Foots Cray; Sir E. Saunders, Fairlawn, Wimbledon, a charmingly-arranged basket of Chrysanthemums; the Duchess of Wellington, Strathfieldsaye; Mr. H. J. Jones, Ryecroft Nursery, Lewisham, and others; and table decorations, each one filling a table, from Miss Lilian Hudson, The Gardens, Gunnersbury House, Acton; and Mr. J. R. Chard, Stoke Newington. The exhibition was opened by Lord Iveagh, one of the Vice-presidents. It is intended to hold an exhibition of spring-flowering bulbs in March next.

CRYSTAL PALACE.

NOVEMBER 2.—The show of Chrysanthemums held annually under the auspices of the Crystal Palace Company, is usually one of the first of the season, and calculations are sometimes made from the exhibits here as to the quality of the blooms that may be expected at the later shows. On the occasion under notice, all sections excepting that of the incurved, were represented in about average quantity, and of not more than average quality. Incurved flowers were weakest, there being but few really first-class blooms staged, owing primarily to the fact that the show was much too early for this section, and growers had to stage the first flowers with but few to select from.

Mr. N. Molyneux, gr. to J. Carpenter Garnier, Esq., Rooksbury Park, Wickham, Hants, secured the first prize in the leading open class, and staged a collection of forty-eight blooms, twenty-four incurved and twenty-four Japanese. The incurved blooms were weak, but there was a capital Baron Hirsch, and a bloom of Madame Darrier was pretty. Japanese flowers were much better, and may be described as satisfactory. Col. W. B. Smith was about the best, and the new M. Panckoucke was exhibited well. This will become one of the most popular of the yellows. International was large, and served well for the back row, but the variety is open to the objection of being a trifle rough. Souvenir d'une Petite Amie, President Borel, G. W. Childs, Madame Charles Molin, and Louise were new ones included in this stand. The last-named was a fairly good bloom, but was too pale. The 2nd place was taken by Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park, New Barnet. Duke of York, Madame Charles Capitant, Primrose League (lacking colour), and Commandant Blusset were included among the Japanese. The last-named is a good deep flower, and of distinct colour. M. E. A. Carrière is a pretty white flower, with good florets slightly incurving. The incurved blooms were only ordinary. Mr. C. J. Salter, gr. to T. B. Haywood, Esq., Woodhatch Lodge, Hayward's Heath, Reigate, was 3rd; and again the Japanese blooms were the best.

The 1st prize for eighteen incurved varieties was won by Mr. Thos. Robinson, gr. to W. Lawrence, Esq., Elsfield House, Hollingbourne. The blooms were rather weak. The prettiest were Madame Maute, a rich yellow; White Venus, Miss M. A. Haggas, and Madame Darrier. Mr. Jupp, gr. to G. Boulton, Esq., Torfield, Upperton, Eastbourne, was 2nd; and Mr. Lees 3rd.

The class for twelve incurved, contained larger and better flowers. Mr. W. Collins, gr. to J. W. Carlile, Esq., Ponsbourne Park, Hertford, was 1st, the best of his blooms being John Doughty, Queen of England, Mrs. Heale, and Baron Hirsch; 2nd, A. Jones, gr. to Miss Wyburn, Hadley Manor, Barnet.

The best six incurved blooms of one variety were some Jeanne d'Arc from Mr. W. Japp, fairly good, but a little ragged; Mr. E. Mills, gr. to F. Lloyd, Esq., Coombe House, Croydon, was 2nd, with Baron Hirsch, shown past their best; and Mr. W. E. Tidy, Brockhampton Nurseries, was 3rd, with Jeanne d'Arc.

The best collection of eighteen Japanese blooms came from Mr. W. Collins, and they were an even good lot; the best were President Borel, Princess May, Chas. Davis, and G. W. Childs—this last-named was well up in colour. 2nd, Mr. W. H. Lees, with much smaller blooms, but of capital colour. 3rd, Mr. Geo. Elphick.

There was very spirited competition in the class for twelve Japanese, about sixteen stands being staged. Mr. J. Smith, gr. to W. R. Inglis, Esq., Craigendown, Reigate Hill, who was 1st, had some capital blooms, especially Duke of York, Viviand Morel, Mdlle. Marie Hoste, Princess May, Sunflower, Mdlle. Thé èse Rey, and Chas. Davis. 2nd, Mr. E. Tickner, gr. to J. Watney, Esq., Shermanbury House, Reigate; Chas. Shrimpton and Mrs. A. G. Ramsay were the best. 3rd, Mr. W. Slowgrove, gr. to Mrs. Crawford, Sutton, Reigate.

Out of fourteen competitors for six blooms of one variety of Japanese, the 1st prize was won by Mr. Slowgrove, who had good blooms of G. C. Schwabe; 2nd, Mr. G. Stur, gr. to A. Morden, Esq., The Stone House, Reigate, who had moderately good flowers of Mdlle. Marie Hoste; Mr. Geo. Elphick, gr. to Major Hardman, Hurstwood, Hayward's Heath, was 3rd, with Viviand Morel.

Mr. C. J. Salter won for eighteen reflexed and Japanese reflexed, and of a nice lot, the old Val d'Andorre, Charles Davis, Jno. Shrimpton, and James Lynch, were pretty; Mr. W. Japp was 2nd.

For eighteen Anemone and Japanese Anemone-flowered, distinct, the 1st prize was taken by Mr. J. Justice, gr. to Sir R. Temple, Kempsey, Worcester, and the best varieties as seen here were M. Panckoucke, Fleur de Marie, Delaware, and Sabine; Mr. C. J. Salter, who was 2nd, had a nice collection also; 3rd, Mr. Walter Janks, gr. to W. M. Grant, Esq., Fairlawn, Cobham, Surrey.

The best twelve Pompons were from Mr. Salter, and his best were Nellie Ramford, Mdlle. Elsie Dordan, Black Douglas, and Eynsford Gem; 2nd, Mr. J. Knapp, gr. to F. W. Amsden, Esq., of Chichester Road, Croydon.

Mr. Salter was again 1st for twelve Pompon Anemones, with a very pretty collection; 2nd, Mr. H. Harris, gr. to Mr. Eversfield, Horsham; and 3rd, Mr. J. Knapp.

The best Japanese Anemone-flowered, were from Mr. R. C. Notcut, Broughton Road Nurseries, Ipswich, Madame R. Owen, Mr. Charles Leboscqz, and Nelson, were remarked; 2nd, Mr. Justice; 3rd, Mr. James Milner, gr. to Mr. W. A. Higgs, Willenhall Park, Barnet.

There was but one entry in the class for singles, and that was from Mr. G. Carpenter, gr. to Major Collis-Browne, Broad Oaks, Byfleet, Surrey. The collection was pretty and good.

There was no entry in a class for a group of incurved-flowered plants arranged for effect, but in a similar class for a group of Japanese-flowered plants in 100 square feet, the 1st prize was given for a very nice, uncommonly-arranged group from Mr. W. Wells, Earlswood Nurseries, Redhill. The group had an irregular surface, and was composed of good, well-grown plants placed thinly together. W. H. Lincoln was very fine, and helped well in the group, as did Mdlle. Thé ése Rey. Plants in flower of the new green Ethel Amsden were freely used, and the group was edged with a nice border of Ferns. Messrs. J. Carter & Co., High Holborn, were 2nd, and Messrs. J. Mobsby & Son, 147, Moffat Road, Thornton Heath, were 3rd.

A group to be shown by amateurs in a space of 50 square feet, and including any kinds, was won by Mr. H. Baker, gr. to C. J. W. Rabbits, Esq., Westwood House, Sydenham. The plants were staged too closely, but there were good medium-sized blooms on the plants. 2nd, Mr. C. Trinn, gr. to G. W. Bird, Esq., The Manor House, West Wickham, Kent; 3rd, Mr. T. W. Wilks, gr. to C. Ralph, Esq., Cranbrook Villa, Fox Lane, Upper Norwood.

Mr. W. Wesker had a 2nd prize for four trained specimens of incurved varieties distinct, grown in pots not exceeding 12 inches, and a 2nd prize for a like number of Japanese varieties, also for Pompon varieties. Mr. G. H. Cooper, florist, Sydenham Road, Croydon, was 1st for twelve standard-trained Chrysanthemums, including Japanese, incurved, and Pompon varieties, four plants of each; and Mr. J. Carpenter, gr. to — Pursord, Esq., Broadstairs, Lower Tooting, 3rd.

Mr. D. Aspland, florist, Crystal Palace, won a class for cut Chrysanthemum blooms, arranged for effect, on a space of 60 square feet, with a light and exceedingly tasteful arrangement. Mr. Wells 3rd.

Miscellaneous.—H. B. Ironside, Esq, sent blooms of seedling varieties raised by himself, including Miss Florence Lunn, a violet-purple reflexed Japanese, and others of some merit. Mr. C. J. Salter showed blooms of Jas. Lynch, and of Clara Jeal, a white Japanese reflexed. Mr. Robt. Owen, Maidenhead, showed Japanese Queen of Buffs, some blooms of E. G. Hills, and others. Messrs. Jno. Laing & Sons, Forest Hill, London, S.E., had a group of miscellaneous stove and greenhouse plants, also Chrysanthemums and cut blooms of same. Messrs. H. Cannell & Sons, Swanley, Kent, exhibited seedling Chrysanthemums, about 2 feet high, bearing blooms; also cut flowers of Globe d'Or, Amy Chantler, John Machar, &c. Messrs. W. Miles & Co., Church Road, Hove, had a table filled with Solanums and Primulas.

HAVANT.

November 2, 3.—The eleventh exhibition of Chrysanthemums in this town was held in the Town Hall on the above dates. Cut blooms made an excellent display. For thirty-six Japanese, not fewer than twenty-four varieties, Mr. J. Agate, nurseryman, Havant, easily won the 1st prize with blooms of good quality, if not of exceptionally large size; 2nd, Mr. Parrott, gr. to Mr. Kincaid Smith, Wood End, Chichester. The best twenty-four Japanese were those shown by Mr. Steptoe, gr. to G. A. Gale, Esq., Horndean; Mr. F. Suter, gr. (who took the 2nd prize) to — Lascelles, Esq., Funtington, being a serious competitor. The best twelve blooms, distinct, brought numerous entries, Mr. Agate winning the 1st prize with good blooms of choice varieties; 2nd, Mr. Steptoe.

Incurved varieties were really well shown by Messrs. Suter and Steptoe in the class for twenty-four blooms, and Mr. Parrot won the chief prize for twelve blooms. Mr. Steptoe staged the best Anemone-flowered cut blooms, and Mr. Agate Pompons and single-flowered kinds. Mr. Woodfine, gr. to Major Boyd, Emsworth, had the finest lot of reflexed varieties. Mrs. C. Stubbs showed capital dinner-table decorations with Chrysanthemum blooms, and Mr. Holmes was the most successful exhibitor of Chrysanthemums amongst amateurs; the groups of Chrysanthemums being put up by Messrs. Agate and White.

ST. NEOT'S.

November 5.—This exhibition of Chrysanthemums, to which a considerable amount of interest attaches, from the fact of the St. Neot's Society being the holders, with three wins to their credit, of the Trophy presented by the National Chrysanthemum to affiliated societies, was held one day in advance of the National. Those able to form an opinion pronounced it the best show yet held. The Trophy will not most certainly be surrendered without determined effort to retain it on the morrow.

The class for thirty-six blooms, eighteen each of Japanese and incurved, brought out two strong exhibits, the 1st prize, which carries with it the Silver Challenge Cup, value 10 guineas, being awarded to Mr. Myers, gr. to the Earl of Sandwich, Hinchingbrooke, who has now won it twice, but has to accomplish this once more before it becomes his absolutely. Both sections were strongly represented, the finest of the Japanese being Viviand Morel, Charles Davis, Sunflower, Colonel Chase (extra), Avalanche, Mrs. E. W. Clarke, Viscountess Hambledon, Violetta, Van der Heede (very distinct), and Princess May; the newer varieties being very strong. The finest incurved were of the Queen and Princess types, Golden Empress, Robert Parker, John Lambert, Empress of India, Lucy Kendall, Violet Tomlin, and Robert Petfield, being extra good. Mr. Petfield, gr. to A. J. Thornhill, Esq., Deddington, whose father (recently deceased) won the cup last year, was placed 2nd; better success may attend his efforts another year; the finest flowers were Etoile de Lyon, Viviand Morel, White Louis Bœhmer, Waban, Avalanche, White Empress, John Doughty, and Baron Hirsch.

Mr. Myers was 1st also for twelve incurved blooms, with a finer set than in his cup exhibit, the Queen family being strongly *en evidence*. Mr. Petfield followed with smaller flowers but neat. Mr. Myers won again with twelve Japanese, having similar varieties to those in his cup stand. Once more Mr. Petfield was 2nd, his stand lacking colour.

Mr. Allis, gr. to Major Shuttleworth, Old Warden Park, Beds, had the best half-dozen of one variety of Japanese in Avalanche, pure in colour; Mr. Myers being 2nd with large Etoile de Lyon, but 1st with one variety of incurved, with Lord Alcester, very fine; and Mr. Petfield 2nd with Baron Hirsch.

A fine stand of Anemone, large-flowered, was shown by Mr. Myers, in which John Bunyan, Cincinnati and Delaware were the best blooms, and of Pompons, in which Perle des Beautés, Cendrillon, and Elise Dordan, were the best.

Specimen plants were unusually fine, and the competition keen between the 1st and 2nd, for four trained plants, the premier award going to Mr. Stone, gr. to R. A. Cochrane, Esq., The Downs, his plants being one mass of bloom. The best were Stanstead Surprise, Mrs. Cochrane, and Madame B. Rendatler.

Mr. Park, gr. to A. C. Sweeting, Esq., Huntingdon, had the finest group; good culture, with extra-fine blooms of the Japanese, combined with a tasteful but informal arrangement, placing him well in advance.

The amateurs classes were well-filled, the group-class being particularly good. Decorative exhibits were also noteworthy features. Fruits and vegetables also added to the attractiveness of the show.

BRIGHTON AND SUSSEX NEW HORTICULTURAL.

November 6, 7.—Excellent as the meetings of this Society have been, they were surpassed by that held on the above dates. The groups were a special feature, and plants were of a well-finished kind. The keenest competition was in the classes for groups and cut flowers of Japanese varieties; but throughout the prizes called forth many competitors, who were much closer together than usual.

Groups and Plants.—For the best semi-circular group measuring 14 feet by 8 feet, the competition resulted in Mr. Head, the Drive Nursery, Brighton, being 1st, with remarkably good flowers, in conjunction, tastefully arranged; 2nd, Mr. J. Hill, gr. to Marriage Wallis, Esq., Withdean, with an equally good arrangement, but weaker flowers.

For a smaller group, Mr. Fairs, gr. to R. Clowes, Esq., Hassocks, won with a very bright lot of good flowers, well arranged; and 2nd, Mr. J. Thorpe, West Hill Road, Brighton, with one of the best-finished arrangements in the show.

A class for twelve plants, arranged with Ferns, was strongly contested, the 1st and 2nd prizes going to Mr. G. Miles, Victoria Nursery, Dyke Road, Brighton, and Mr. Turner, gr. to Sir Greville Smythe, Wick Hall, Hove, respectively.

In a small group, for amateurs only, Mr. W. J. Austen, Hove, had some splendid examples, but was closely run by Mr. A. E. Coleman, the prizes going as named.

Mr. Thorpe, West Hill Road, was 1st for a specimen plant in this division. Mr. E. Meachin was 1st for four standards, and 2nd for a single ditto, being beaten in this class by Mr. Hill, gr. to Marriage Wallis, Esq., who was 2nd for four standards.

For four pyramids, Mr. Hill was 1st; and Mr. A. Scutt, gr. to Mrs. Jenkins, Burgess Hill, 2nd. Mr. Hill beat Mr. Meachin for a specimen pyramid. Mr. Scutt was 1st for four dwarfs, and Mr. Hill for a specimen dwarf. The plants were well grown, and trained in a less formal manner than usual. Primulas, Cyclamens, and table plants were also well represented.

Cut Flowers.—A class for thirty-six Japanese varieties was very well contested, all stands being considerably beyond average good quality, and their merits difficult to decide. Mr. Martin

Standing, gr. to Mrs. Joad, Worthing, was 1st for a very even lot, a few of the best being Princess May, G. W. Childs, Avalanche, Mrs. F. Jameson, Sunflower, Mrs. E. W. Clarke, and Val d'Andorre; Mr. W. Neville, gr. to Mr. Flight, Twyford, Hants, was 2nd, good examples of W. H. Lincoln, Louise, Thomas Hewitt, Wilfred Marshall, and Amos Perry, being present in his stand; and Mr. Wells, of Earlswood Nursery, was a close 3rd. In this exhibit we noticed Mdlle. T. Rey, W. H. Lincoln, Vice President Calvat, and William Seward, as being particularly good.

For twenty-four Japanese, Mr. Standing was again 1st; Mr. J. Hopkins, gr. to Mrs. Thornton, High Cross, Framfield, making a good 2nd. Twenty-four incurved: 1st, Mr. A. Payne, gr. to Mrs. Ernold Smith, The Oaks, Emsworth, Jeanne d'Arc, John Lambert, Baron Hirsch, White Empress, Mrs. A. Haggas, Mrs. S. Coleman, and Golden Empress being the best; Mr. J. R. Heasman, gr. to Mrs. Oxley, Turner's Hill, was 2nd; and Mr. M. Standing, gr. to Mrs. Joad, Worthing, 3rd. The competition being particularly close as regards the winners.

Mr. Horscroft, gr. to T. Potter, Esq., Ardingly, and Mr. Elphick, gr. to Major Hardman, Hayward's Heath, were 1st and 2nd for twelve Japanese blooms, in a strong lot, White Louis Bœhmer and G. C. Schwabe being very good in the winning stand.

For twelve incurved, Mr. F. Suter, gr. to T. Lascelles, Esq, Chichester, was a capital 1st, Mr. Horscroft following. The 1st for Anemones went to Mr. Heasman. In a class for six Japanese, Mr. Emery was a good 1st, against sixteen competitors.

Six blooms, of any one variety, were very strongly contested, Mr. Martin standing winner with Avalanche among the whites, Mr. Horscroft with Sunflower among yellows, and Mr. Hopkins, Framfield, with Viviand Morel, in a class for any variety. A stand of Col. W. B. Smith, from Mr. Baker, gr. to F. H. Baxendale, Esq., Framfield, deserves special notice, although not finding favour with the judges.

Miscellaneous.—Grapes were well shown by Mr. J. Bury, gr. to C. Bayer, Esq., Forest Hill; Mr. Stringer, gr. to W. A. Bevan, Esq., Coombe Court, Kingston-on-Thames; Mr. Heasman, gr. to Mrs. Oxley, Fen Place, Turner's Hill; and Mr. T. Fairs, gr. to R. Clowes, Esq., Hassocks.

Dessert Pears by Mr. G. F. Bunney, Lewes Road, Brighton; and Mr. J. Spottiswood, Queen's Park, Brighton; while for one dish, Mr. W. Bishop, Byworth, Petworth; and Mr. H. Head, Shoreham.

Apples, which were not numerous, were well shown by Mr. J. Hill, gr. to M. Wallis, Esq.,; and Mr. G. Storell, gr. to H. Young, Esq., Withdean. Non-competitive exhibits came from the local nurserymen in some considerable quantity.

EXMOUTH CHRYSANTHEMUM SHOW.

November 7.—The ninth annual exhibition of the Exmouth Gardeners' Mutual Improvement Association was held on the above date, when the entries were so numerous as to tax the capacity of the Volunteer Drill Hall, in which this show is always held. Being the first Chrysanthemum show in the neighbourhood for the season, a good many gardeners from surrounding places turned up to see how matters stood, and the general verdict was that Chrysanthemums in this district were rather late, uneven in quality, and, owing to the continued wet weather, a considerable number of good blooms were damping off. The plants in the groups showed an unmistakable tendency to return to the old bush form rather than the lanky style, with two or three mop-like blooms at the top, and an uncommonly nice group shown by Sir John Phear, of Marpool (gr, Mr. Kelland), who took a well-deserved 1st in the 7 feet by 6 feet group class. The plants were well-clothed with healthy dark-green foliage, and the quality of the flowers was good.

In the cut-bloom class there were some fairly good flowers among them, and in the 1st-prize lot of thirty-six Japanese varieties, won by Miss Fripp, The Grove, Teignmouth (gr, Mr Stiles), a magnificent bloom of Viviand Morel, 6 or 7 inches deep, and of fine form and colour, was observed, and this bloom having developed from a crown bud, it was rather fine in the petal. This variety was found in nearly every exhibit, Florence Davis and Beauty of Exmouth coming next in popular favour.

In Miss Fripp's lot were good examples of Mrs. C. H. Payne, Stanstead White, W. Tricker, and Charles Davis. Louise, a more than ordinary-fine bloom, with a pale flesh-like hue, resembling Souvenir de la Malmaison Carnation, was well shown by Mark Farrant, Esq., of Exeter (gr., Mr. Protheroe), and in the same lot was a fine John Shrimpton.

The Certificates of the National Chrysanthemum Society went to Mrs. Kingscote, of Exmouth, and Mrs. Gooding, Exmouth; both groups being well put together, in the latter the foliage being all that could be desired, whilst the blooms were fresh and of good size. Fruit was only middling in quality, as were also vegetables.

The table decorations were very effective, and showed much good taste in arrangement and design. Mr. W. J. Godfrey had a splendid collection of Chrysanthemums, Pelargoniums, and cut blooms, staging fine examples of his new Carnations Miss Mary Godfrey and Reginald Godfrey. His new Chrysanthemum, Mrs. W. J. Godfrey, is a seedling from Mrs. Alpheus Hardy, but only slightly partakes of the peculiarities of that variety. Indeed, the petals are nearly smooth, few being hirsute, and those only partially so. The petal is broad, white, curled, and glistening, reminding one of Moonlight. It is a good thing, apparently.

PLANT PORTRAITS.

Begonia Paul Bruant, *Garden*, August 25

Bertolonia hybrida, *Wiener Illustrierte Garten Zeitung*, August, 1894.

Browallia speciosa major. *Revue de l'Horticulture Belge*, October.

Trichopilia suavis, Lindley, *Lindenia*, t. 423.

Tropæolum Lindeni. *Illustration Horticole*, Sept. 15, 1894, t. 17; a climber, with peltate dark-green leaver, the veins marked out with a lighter colour; flowers trumpet-shaped, rose-pink with green tips to the sepals. Mountains of Colombia.

TRADE NOTICE.

Mr. John Davis, formerly head gardener to Alfred O. Walker, Esq., Leadwork House, Chester, has taken over the nursery business hitherto belonging to Mr. J. B. Crane, at Great Meols, Hoylake, Cheshire, which he intends carrying on together with a horticultural agency.

FRUIT NOTE.

THE "EARL'S FAVOURITE" MELON.

It is so seldom that we meet with a high class Melon, that the appearance of "The Earl's Favourite" deserves note. It was raised by Mr. H. W. Ward as a cross between Lockinge Hero, white-fleshed, and the Bouverie, a green-fleshed variety. It is a slightly netted Melon, of medium to large size; the fruits averaging 4½ lb. each; the flesh is deep pale green, melting, very juicy, and the flavour delicate though rich. It was adjudged an award of merit at the last meeting of the Fruit Committee of the Royal Horticultural Society, and it is probable that a higher award will ultimately be given to it, as the committee expressed a wish to see it again in summer. Mr. Ward tells us that in January last he planted one house entirely with the Earl's Favourite for supplying ripe fruit in May, and at the end of June he planted two houses exclusively with it. From these plants he has been cutting ripe fruit from the beginning of October.

Obituary.

Mr. Henry Sibray.—We regret to announce the death recently of Mr. Henry Sibray, of the firm of Messrs. Fisher, Son, and Sibray, Handsworth Nurseries. The deceased was fifty-seven years of age. When only a lad he joined the firm of Messrs. Fisher, Holmes, and Co., and devoted much painstaking attention to the interests of the firm. A few years later he married the eldest daughter of the late Mr. Edward Holmes, and subsequently when his father-in-law retired from business, took his place as a partner in the concern. The deceased gentleman devoted himself to his business, and took very little part in public affairs. He leaves one son, Mr. E. E. Sibray.

The Colours of Roses.—A German correspondent writes:—"The last Congress of Rose-growers at Gorlitz, in July last, took up the question of the possibility of finding a method for the classification of the colours of Roses. Many classifications were proposed, and coloured papers were exhibited as models and examples, but it was observed that hardly any of them corresponded with the shade of rose in the flowers themselves. This inconvenience may partly arise from the paper not being so translucent as Rose-petals; therefore, coloured silk was suggested for the purpose. This, perhaps, will be found to be too bright. A Rose-grower suggested a better method of determining the colour of a Rose by comparison with well-known types, such as La France, Maréchal Niel, Hermosa, &c. But what if the reader is totally ignorant of those very types? A knowledge of the standard colours, and some typical intermediate shades, may be considered sufficient for ordinary purposes. The difficulty begins when it is desired to determine the different shade of any particular colour. The leaf of a Walnut, for instance, is green, and so are the leaves of a Robinia or an Eucalyptus; yet there is so much difference between their respective hues, that they can hardly be compared one with the other. The same colour, moreover, may produce different effects; this depends on the nature of the substratum. Wool, cotton, silk, wood, &c., may be dyed with the same colour, and yet be of quite a different appearance. So the above question is still open—Who is to answer it?

Caterpillar Plague in Hong Kong.—From the Botanic Garden, Hong-Kong, we have received a report by Mr. W. J. Tutcher, on the plague of caterpillars which has recently been doing much damage in nearly all parts of Hong-Kong and Kowloon to the Pines (Pinus sinensis). The caterpillar has been identified as that of the moth (Eutricha punctata), and very active steps are being taken to check the ravages of this pest.

MARKETS.

COVENT GARDEN, November 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Supply during the past week rather short. Prices keep firm for all kinds, with a tendency to rise values for the cheaper kinds. *J. B. Thomas.*

SEEDS.

LONDON: *November 7.*—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market was sparsely attended by buyers. Cable advices quote American Red Clover seed one shilling higher. Canadian Alsyke, on account of its goodness and cheapness, meets with increasing favour. Italian Rye-grass is rather dearer. There is not much passing in Tares. Rye is now unprecedentedly low. For Scarlet Runner Beans more money is asked. New English Longpods are now exceedingly reasonable. In Haricot Beans prices favour holders. Blue Peas keep steady. No new feature in Bird-seeds. French Buckwheat unchanged. Linseed moves off slowly on former terms.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *November 6.*—Quotations:—Cabbages, 1*s.* 6*d.* to 3*s.*; Savoys, 2*s.* to 3*s.*; Cauliflowers, 3*s.* to 5*s.* per tally; Turnips, 1*s.* 6*d.* to 2*s.*; Carrots, 1*s.* 6*d.*; Parsley, 9*d* to 1*s.* per dozen bunches; Horseradish, 1*s.* to 1*s.* 6*d.* per bundle; Onions, foreign, 2*s.* to 2*s.* 6*d.* per bag; do., English, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.; Apples, 2*s.* to 8*s.* per bushel; Pears, 1*s.* 6*d.* to 3*s.* 6*d.* per half sieve.

STRATFORD: *November 6.*—The market has been well supplied with every description of produce during the past week, and, with a good attendance of buyers, a brisk trade was done at the prices mentioned below:—Cabbages, 1*s.* 6*d.* to 3*s.* per tally; Savoys, 1*s.* 6*d.* to 3*s.* do.; Greens, 3*s.* to 5*s.* 6*d.* do.; Cauliflowers, 6*d.* to 1*s.* per dozen; do, 2*s.* to 5*s.* 6*d.* per tally; Celery, 7*d.* to 1*s.* per roll; Horseradish, 1*s.* to 1*s.* 3*d.* per bundle; Brussels Sprouts, 9*d.* to 1*s.* 3*d.* per half-sieve; do., 1*s.* 6*d.* to 2*s* per flat; Turnips, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen bunches; do., 2*5s.* to 40*s.* per ton; Carrots, household, 22*s.* 6*d.* to 30*s.* do.; do., cattle-feeding, 18*s.* to 25*s.* do.; Parsnips, 6*d.* to 10*d.* per score; Swedes, 15*s.* to 20*s.* per ton; Onions, English, 60*s.* to 75*s.* do.; do., Dutch, 2*s.* to 2*s.* 6*d.* per bag; do., Valencias, 6*s.* to 6*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel.

FARRINGDON: *November 8.*—Quotations: Parsnips, 50*s.* to 55*s.* per ton; Carrots, 35*s.* to 45*s.* do.; Onions, English, 70*s.* to 80*s.* do.; Celery, 8*s.* per dozen; Brussels Sprouts, 9*d.* to 1*s.* per half sieve; Horseradish, 1*s.* 3*d.* per bundle; Cabbages, 6*d.* per dozen; Cauliflowers, 1*s.* do.; Tomatos, 6*s.* per doz. lb.; Leeks, 1*s.* 3*d.* per dozen; Herbs, 1*s.* 6*d.* per dozen all round; Chestnuts, 11*s.* per bag; Walnuts, 6*s.* 6*d.* do.; Apples, cooking, 6*s.* per bushel; dessert, 7*s.* do.

POTATOS.

BOROUGH AND SPITALFIELDS: *November 6.*—Prices ranged from 50*s.* to 95*s.* per ton.

STRATFORD: *November 6.*—Quotations:—Magnums, Dark-soil, 55*s.* to 65*s.*; do. Light-soil, 60*s.* to 75*s.*; Bruces, 65*s.* to 75*s.*; Imperators, 65*s.* to 80*s.*; Main Crop (Scotch), 65*s.* to 75*s.*; Kidneys, Main Crop, 75*s.* to 85*s.*; Bruces, do., 60*s.* to 70*s.* per ton.

FARRINGDON: *November 8.*—Quotations:—Main Crop, 80*s.* to 90*s.*; Sutton's Abundance, 80*s.* to 90*s.*; Bruce, 65*s.* to 75*s.*; Magnums, 60*s.* to 70*s.* per ton.

LONDON AVERAGES: *November 7.*—Main Crops, 80*s.* to 100*s.*; Hebrons, 80*s.* to 90*s.*; Magnums, 70*s.* to 80*s.*; Snowdrops, 80*s.* to 90*s.*; Early Rose, 70*s.* to 85*s.*; Champions, 55*s.* to 65*s.*; Kidneys, 60*s.* to 70*s.*; Black-lands, 50*s.* to 65*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending November 3, and for the corresponding period last year:—1894: Wheat, 18*s.*; Barley, 23*s.* 8*d.*; Oats, 13*s.* 6*d.* 1893: Wheat, 27*s.* 4*d.*; Barley, 29*s.* 5*d.*; Oats, 18*s.* 2*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 128*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 6 *s.* to 112*s.*; do, inferior, 30*s.* to 60*s.*; Mixture, 90*s.* to 110*s.*; and Straw, 22*s.* to 38*s.* per load.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (—) the Mean for the week ending November 3.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1894.	Below 42°, difference from Mean since January 1, 1894.	Rainfall. More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1894.	Total Fall since Jan. 1, 1894.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1894.
		Day-deg.	Day-deg.	Day-deg.	Day-deg.	10ths Inch.		Ins.

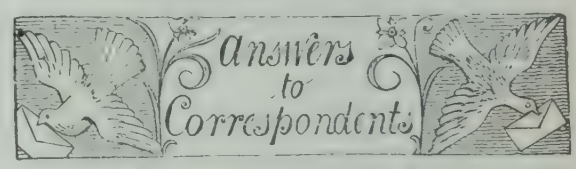
*	6 +	100	0	+ 303	— 18	2 +	184	30·1	21	42

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.



THE following summary record of the weather throughout the British Islands for the week ending November 3, is furnished from the Meteorological Office:—

"The *weather* continued in a very unsettled condition in all parts of our Islands, with further heavy falls of rain in all the southern and south-western districts, and considerable quantities over the country as a whole. Thunderstorms occurred in several parts of England on the 29th.

"The *temperature* was much above the mean, the excess ranging from 3° or 4° in 'Scotland,' to 5° in 'Ireland,' to 6° in 'England, E. and S.W. and the Channel Islands,' to 7° in the 'Midland Counties,' and to 8° in 'England, S.' The highest of the maxima were recorded on November 1, when the thermometer rose to 65° in 'England, S.' (in London), to 64° in the 'Midland Counties,' and to between 60° and 63° elsewhere. The lowest of the minima were registered, as a rule, on October 29, and varied from 22° to 30° in 'Scotland,' from 32° to 33° in 'Ireland,' and from 31° to 41° in 'England.' In the 'Channel Islands' the lowest reading was 49°.

"The *rainfall* was somewhat less than the mean in 'Scotland, N. and England, N.E.,' but in all other districts there was an excess; that in 'Scotland, E. and W., Ireland, S., and England, S.W. and S.,' being again very large. In the last mentioned district the fall was more than three times as much as the mean.

"The *bright sunshine* was very little prevalent in all districts, excepting 'Ireland, N.' The percentage of the possible duration ranged from 7 to 20 in Scotland, from 12 to 20 in England, and from 28 to 35 in Ireland."

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

BICTON: A CORRECTION. In our account of Bicton given in our last number, instead of trained Myrtles on the terrace facing the lake, read Sweet Bays, &c. The Myrtle, Mr. Mayne, the gardener at Bicton, tells us, does not succeed away from the shelter afforded by a wall.

BLACK CURRANT: *J. A. B. and K. M. G.* The buds are infested by the Currant-bud mite, to get rid of which you should cut off and burn the affected shoots. See an account of this insect in our issue for September 8, p. 293.

CYPRIPEDIUM INSIGNE: *T. T.* They are of good ordinary type of bloom, and the slight differences from the type do not warrant varietal names being given them.

ESCAROLLE: *W. X.* This is the Dutch name for the broad-leaved Batavian Endive with short leaves. You can obtain seed of it at any good seed-shop.

HORTICULTURAL EXAMINATIONS: *C. P.* You should direct your enquiries to the Secretary of the Royal Horticultural Society, 117, Victoria Street, S.W.

INSECT: *J. W.* The larva of the Rose-chafer, Cetonia aurata. It feeds on the roots of Strawberry and other plants.

JUMPING BEANS: *M. R. & Co.* Thanks; we have had some sent us within the last few years.

NAMES OF FRUITS: *J. E.* Apple, Dumelow's Seedling (Wellington).; Pear too poor a specimen to determine. Thanks for offering for Gardeners' Orphan Fund.—*A. & McA.* 1, Beurré Diel; 2, Louise Bonne of Jersey.—*H. M. T.* 1, Duchesse d'Angoulême; 2, Doyenné du Comice.—*J. H. J.* 1, Marie Louise d'Uccle; 2, Van Mon's Léon Leclerc.—*Poivre.* 1, Beurré Bosc; 2, Bergamotte d'Esperen.—*J. McM.* 1, Hall Door; 2, Bedfordshire Foundling; 3, King of the Pippins; 4, Beurré

Diel; 5, Beurré Rance; 6, Black Pear of Worcester.—*A. Gooden, Chichester.* 1, Forelle; 2, Bellissime d'Hiver; 4, Chaumontelle; 6, Althorpe Crassane; 7, Easter Beurré; 8, Beurré Rance; 9, Beurré d'Aremberg; 10, Beurré Diel.—*B. L* Pear Van Mon's Léon Leclerc.—*C. Longman.* London, or Five crowned Pippin.—*W. R. C.* 1, Beurré d'Amanlis; 2, Flemish Beauty; 3, Swan's-egg; 6, Redstreak.—*L. B. G.* 1, Doyenné du Comice; 2, Glou Morçeau; 3 Beurré d'Aremberg; 4, Winter Nelis; 5, Doyenné Boussoch; 6, Easter Beurré; 7, Catillac; 8, Huyshe's Bergamotte.—*J. C. Quex.* Pears: 1, decayed; 2, Doyenné du Comice; 3, Beurré Clairgeau; 5, Forelle; 6, Duck's Bill.—*J. Paul.* 1, Marie Louise; 2, Louise Bonne; 4, 5, Beurré Diel; 6, Easter Beurré.—*G. W.* 44, New Hawthornden; 45, Cox's Pomona; 46, King of the Pippins; 48, Grange's Pearmain; 50, Betty Geeson; others unknown.—*Alpha.* A, the old or Autumn Bergamot; B, Passe Colmar; C, Beurré d'Aremberg; D, Gravenstein; F, Lord Derby.—*R. H.* 2, King of the Pippins; 3, Washington; 4, Cockpit; 6 or 9, Huyshe's Victoria, the number very indistinctly written.—*W. G.* Beurré Clairgeau.

NAMES OF PLANTS: *T. F. J.* 1, Cotoneaster affinis; 2, Adiantum macrophyllum; 3, Litobrochia aurita; 4, Olearia Haastii; 5, Eriobotrya japonica; 6, Ophiopogon Jaburan. Others next week. *J. C. S.* 1, Peziza fascicularis, A. and G.; 2, Ag. (Pleurotus) septicus, Fr.; 3, Lichen Peltidea canina; 4, Panus stypticus, Fr.; 5, Ag. (Clitocybe) tubæ, Fr.; 6, Craterellus cornucopioides, Fr.—Second lot: 1, Ag. (Colly) maculatus; 2, Cortinarius elatior; 3, Hygrophorus chlorophanus; 4 Hygrophorus puniceus; 5, Ag. (Clito) inversus; 6, Ag. (Euto) sericeus. You transgress the rules by sending more than six. — *J. M.* 1, Rhodea japonica; 2, Euphorbia stricta; 3, Dianthus Seguieri; 4, Gypsophila acutifolia; 5, Polygonum bistorta.—*W. H. Divers.* Helvella crispa, edible. Excellent when dried, to add to soups and gravies in the winter, for its flavour. *B. M.* Common China or Monthly Rose.—*J. H. G.* We cannot tell what the flower is from the scrap sent.—*S. N.* 1, Nepeta glechoma; 2, Sedum rupestre; 3, Saxifraga; 4, Saxifraga.—*W. M.* The Osage Orange (Maclura aurantiaca).

POTATO TRIALS: *J. Andrews.* Write to Mr. Barron, Superintendent, Royal Horticultural Society's Gardens, Chiswick.

VIOLETS, MARIE LOUISE: *J. Roberts.* The Violets sent, notwithstanding the check the plants received by the transplanting, are very good, and furnished with the long stalks so useful to the bouquet-makers.

WHITE FLOWERED ERICAS IN FEBRUARY: *Erica.* E. hyemalis, E. persoluta alba.

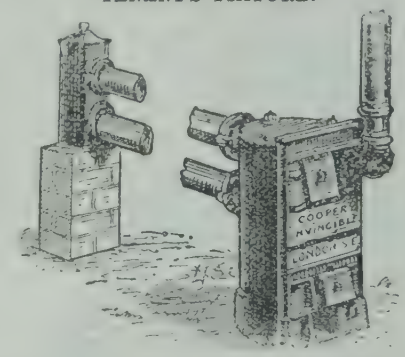
AMATEUR FORCING HOUSE.



The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

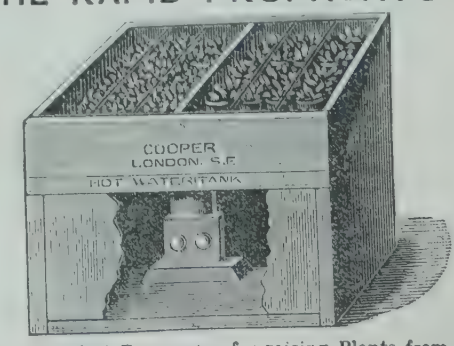
"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1, to drive 75 ft., £1 15*s.*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

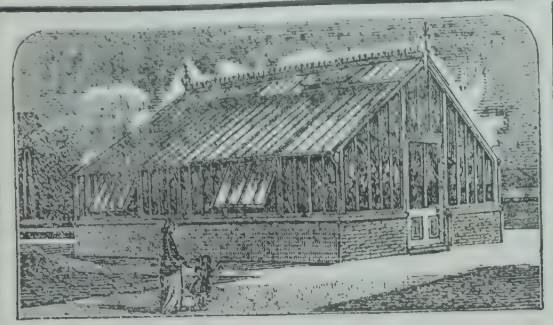
TENANT'S FIXTURE.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.



Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

COOPER'S HYGIENIC HEATER.



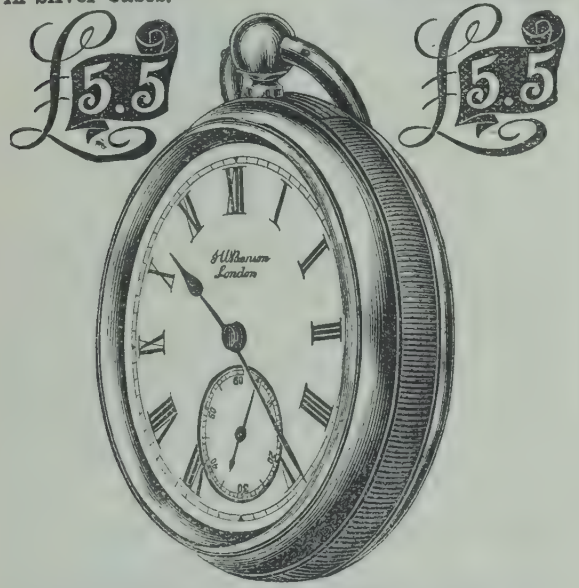
Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 45 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

THE RAPID PROPAGATOR.

The only perfect Propagator for raising Plants from seeds, slips, or cuttings:—

1 ft. 8 in. by 1 ft. 6 in.	£1 0 0
2 ft. 6 in. by 1 ft. 10 in.	1 4 0
4 ft. by 2 ft.	2 8 0

THIS GREENHOUSE erected and heated complete, in any part of the country, best materials only, workmanship guaranteed, 25 ft. by 12 ft., £50; 30 ft. by 15 ft., £70. Brickwork excepted. For particulars, see our Catalogue, post-free.



Superior Portable Frames, large stock ready for immediate use, well made, painted four coats, glazed with 21-oz. glass, carriage paid:—1-light frame, 4 × 6, 36*s.* 6*d.*; 2-light frame, 6 × 8, 58*s.*; 3-light frame, 12 × 6, 85*s.* 6*d.*

Span-roof Frames, 9 × 5, £3 15*s.*; 12 × 6, £5; 16 × 6, £7 10*s.* Can send off same day as ordered.

"THE WILD GARDEN:"
OR
The Naturalisation and Natural Grouping of Hardy Exotic Plants, with a Chapter on the Garden of British Wild Flowers, by WM ROBINSON, Author of the "English Flower Garden." Fourth Edition. Illustrated by ALFRED PARSONS

Times.

"A fourth edition of this delightful book, 'The Wild Garden,' which is illustrated by excellent woodcuts, after the drawings of Mr. Alfred Parsons. The author is emphatic in praise of woodcuts as against 'process' engravings, and where the drawings were reproduced by 'process' in the former edition he has now had them re-engraved. The result is a volume as attractive to the eye as to the mind."

Saturday Review.

"The New edition of 'The Wild Garden,' with illustrations by Mr. Alfred Parsons, appears some twenty years after its first appearance, when it stirred with new hopes and a keen emulation the hearts of all who love gardens. The cause then promoted as something of a new departure and a protest against unintelligent formalism has now been gained. Everywhere, in public gardens and in private, we may note the pleasurable proofs of victory. We cordially wish this delightful book in its new form a prolonged life of beneficial influence."

ESTATE SALES.
The Best County Medium for Advertising Sales of Estates is
THE "WORCESTER HERALD,"
ESTABLISHED 1794,
The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

GARDENING APPOINTMENT.

MR. JAMES LAWIE, until lately Gardener at Marriston, Devon, as Head Gardener to Capt. STARKEY, Esq., Bericote House, Leamington Spa.

PARTNERSHIP WANTED, in a MARKET NURSERY (Glass only), near London. Principals only dealt with.—CAPITALIST, 41, Wellington St., Strand, W.C.

WANTED, a HEAD WORKING GARDENER, early in December, where five or six men are kept. Must thoroughly understand the Cultivation of Stove and Greenhouse Plants, including Chrysanthemums, Orchids, Vinery, and Peach-houses, &c. Wages, £70 to £80, with Cottage.—Apply by letter, stating age, and if married, number in family, and length of character, to C. A., Mr. Emerson, 30, Bishopsgate Street Without, London, E.C.

WANTED, a good HEAD WORKING GARDENER.—About 30; two men assistants and boy in spring and summer. House and gas found.—Age, experience, references, and wages required to JOHN CHARLTON, Esq., The Dales, Whitefield, Manchester.

WANTED, a HEAD WORKING GARDENER.—Wages £1 per week, with residence. Married man without incumbrance preferred.—Apply, with recommendations, by letter only, to SECRETARY, Extra Mural Cemetery, Lewes Road, Brighton.

WANTED.—Thorough KITCHEN and FLOWER GARDENER; married; age, about 30; not more than two children. Wages, 15*s.* per week, House and Milk.—Mr. HUTT, Priory Gardens, Burnham, Maidenhead.

WANTED, a good KITCHEN GARDENER.—Age about 26. Wages, £1 1*s.*—Write to R. D., 12, Roskell Terrace, Lower Richmond Road, Putney.

WANTED, an UNDER GARDENER.—22*s.* per week. Must be able to mow with scythe. Age about 30, married.—R. N. Cemetery, East Greenwich.

WANTED, for NURSERY in IRELAND.—A good KNIFESMAN and PROPAGATOR of Outdoor Stuff. Accustomed to take charge of men, and execution of orders. State age, experience, and wages expected, to—HORTUS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a thoroughly practical MAN under Glass (single preferred), who understands Vines, Peaches, Tomatos, Beans, Mushrooms, &c., and who has been in some good market places.—Apply to JAMES NAYLOR, Royal Gardens, Hampton Court.

WANTED, an experienced MAN, as PALM GROWER.—State experience and wages required, to the FOREMAN, Turnford Hall Nurseries, near Broxbourne.

WANTED, for a good Lancashire Nursery, Outside, a reliable, steady SECOND MAN. Will have to take charge in absence of principal. Fruits, Roses, Shrubs, and Ornamental Trees, are the chief stocks grown, with good Landscape-work.—State age, wages expected, and references, to NURSERYMAN, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED.—A Young MAN who has had experience in Seeds, Bulbs, and Plants. Must be a good writer; to serve in shop, and be generally useful. Wages, 20*s.* per week.—Apply by letter, stating age and experience to F. MILLER, 267, Fulham Road, S.W.

WANTED, a SHOPMAN, who is well-up in Flower Seeds.—HARRISON AND SONS, Market Place, Leicester.

WANTED, a respectable young MAN, as CLERK and WREATH-MAKER in a Nursery.—Apply to D. PRIOR AND SON, Myland Nursery, Colchester.

WANTED, an ASSISTANT SHOPMAN. One well acquainted with the Seed and Bulb Trade, and preference will be given to one having a knowledge of the General Nursery Business.—Apply in own handwriting to WM. CUTBUSH AND SON, Highgate Nurseries, London, N.

JOURNEYMAN (FIRST), Inside. — Age 22; CHAS. BLICK (Gardener to Martin R. Smith, Esq., The Warren, Hayes, Kent), can confidently recommend John Rutherford, as above, who has been here for three and a-half years.

APPRENTICE.—Wanted to Apprentice a Youth, age 16, to learn Gardening in a good establishment (Bothy).—SIMS, Post-office, West Malling, Kent.

£4 to Head Gardener who can place a youth (age 19) in the Gardens to learn. Good character.—J. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

MANAGER to the Seed, Florist, and Nursery Trades (or Estate).—Thoroughly conversant with Horticulture, Agriculture, &c (Wholesale and Retail); twenty-five years' practical, theoretic, and scientific knowledge. Guarantee if required.—FOG, 41, Wellington St, Strand, W.C.

SHOP MANAGER.—Wanted by Advertiser, of fourteen years' experience in all branches of horticulture, permanent situation as Manager in Shop. Willing to invest capital in time. Temperance man, with excellent references. Quick salesman.—W. S., 41, Wellington Street, Strand, W.C.

KNIFEMAN.—Age 23; over eight years' experience in Budding, Grafting, and Growing of Fruit Trees, Roses, Conifers, Clematis, Rhododendrons, Hollies, Ivies, General Soft-wooded Propagation, &c.—A. B. C., 41, Wellington Street, Strand, W.C.

ROCK BUILDER, FERNERY FITTER, and HANDY MAN.—Knowledge of Ferns, Aquatics, Fish, &c. Good testimonials. — W. J. C., 125, Portobello Road, Bayswater, London, W.

TO GARDENERS.—Strong lad, age 16, tall, wants a situation in gardens where he will be able to learn. Bothy preferred.—J. SPENCE, Knossington, Oakham, Rutland.

TO NURSERYMEN and FLORISTS.—A Youth (age 17), desires situation where he would have a good opportunity to learn either Nursery or Florist Business. —Excellent references as to respectability, &c.—C. T., 72, High Street, Hampstead, N.W.

TO NURSERYMEN and OTHERS.—Situation required by a young man (age 23); ten and a half years' experience in Growing for Market and Retail.—HAMBIDGE, Willow Bank, Puckpool, Ryde, Isle of Wight.

TO NURSERYMEN.—Young Man well up in propagating and growing Roses, Clematis, &c., also general Nursery work. Eleven years' experience.—X. Y., Mr. E. Myson, Great Parndon, Harlow.

TO MARKET GROWERS and NURSERYMEN.—Situation wanted by a young Man, age 27; four and a-half years in Market-work. Ferns, Bouvardias, and General Pot-stuff. — S. K., Vinery Cottage, Llanvapley, Abergavenny.

SEED TRADE.—Advertiser, age 22, with six years experience in London and Provincial Houses, desires re-engagement. Thorough knowledge of Farm Seeds.—"BUSINESS," *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN.—Twelve years' experience in the Seed, Nursery, and Floral trade; excellent references.—J. H., Mr. Fulker, Stationer, Boscombe, Bournemouth.

ASSISTANT SHOPMAN.—A young man requires a situation as above, in a good Retail Seed Establishment; seven years' experience.—B. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SEED TRADE.—Young man, age 22, wishes situation as ASSISTANT SHOPMAN, in either retail or wholesale house; six years' experience; good references.—B. C., 41, Wellington Street, Strand, W.C.

WANTED.—Investment with Occupation, for about £10, used to Gardening. Good character. Full particulars to C. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS. —Man, age 24, wants situation under Glass. Nine years' experience; London or Suburbs. Good references.—T. J., Belmont, Banchory Rd., Blackheath.

TO FRUITERERS, &c.—Situation wanted by a young Lady (age 24) in a Fruiterer's or Seedsman's. Good experience in Bulbs. Excellent references.—B. F., Mrs. Pitcher, Church Road, Caversham, Oxon.

WHAT MONEY CAN DO.—Money can do a great deal, but it cannot do everything. It cannot stop the passing of time, it cannot make us young again, it cannot renew with health the enfeebled frame. In face of the demon ill-health, rich and poor are on an equality. Rich and poor have to seek the same remedies, and wise indeed are they if, in their sorrow and suffering, they turn to HOLLOWAY'S PILLS and OINTMENT. These are within the reach of the poor as well as of the rich, and it is no idle testimony, but the natural result of long experience, which has declared Holloway to be the poor man's friend.

"CADBURY'S"

COCOA

Of the highest degree of Purity & Nutritive Value

Every drinker of Cocoa should bear in mind the following important facts:

Cadbury's is absolutely pure, therefore best. The "Medical Annual" says the name "Cadbury" on any packet of Cocoa, is a guarantee of purity.

Cadbury's is entirely free from objectionable alkalies giving a false appearance of strength, by producing a dark colour.

Cadbury's being genuine Cocoa, does not thicken in the cup. It is a refined beverage—light, digestible, and nutritious.

Cadbury's is economical — a small spoonful makes a large breakfast cup of delicious, refreshing Cocoa, of the greatest strength and the finest flavour.

Cadbury's is equally suitable for the robust, the young, and the aged, and particularly those of weak and impaired digestion.

Cadbury's is the most stimulating and sustaining, and is made instantly with boiling water or milk.

"CADBURY'S"

"The typical Cocoa of English Manufacture—Absolutely Pure."

—The Analyst.

Editorial communications should be addressed to the "Editor;" Advertisements and Business Letters to "The Publisher," at the Office, 41, Wellington Street, Covent Garden, London, W C. Printed for the Proprietors by Messrs. BRADBURY, AGNEW, & Co. (Limited), Lombard Street, Precinct of Whitefriars, City of London, in the County of Middlesex, and published by ARTHUR GEORGE MARTIN, at the Office, 41, Wellington Street, Parish of St. Paul's, Covent Garden, in the said County.—SATURDAY, November 10, 1894. GARDENER, Herriard Park, Basingstoke.

CARNATIONS, ROSES, PANSIES, VIOLAS, &c.—Her Majesty the Queen in accepting a water-colour drawing depicting a group of Empress Pansies grown by me for Her Majesty's Gardens at Frogmore, graciously expressed her interest in the details of the industry now being carried on at my Flower and Fruit Farms. This industry, which has recently been reported upon by the Government, has grown to such an extent that it is now the largest of its kind either in England or the Continent.
Any of my Customers ordering plants or trees to the value of £1 1s., will have a copy of the unique painting (size 30 in. by 24 in.), above referred to, sent them free of charge.
"I shall frame the beautiful plate of your 'Empress Pansies.'"—OWEN THOMAS, The Queen's Gardener, Frogmore.
Catalogues now ready, free on application.
R. BATH, Wisbech.

VERY BEST VARIETIES.

IT IS IMPOSSIBLE

To issue a full Catalogue of Chrysanthemums until the flowering season is over. If this is done, many of the best are left out, and many worthless varieties recommended. I have, therefore, issued a Preliminary List, which can be had free on application.

My full Catalogue is in preparation, and will again stand alone as the most perfect and useful Guide up to date. This is not only a Guide which Varieties to select, but will also give treatment, such as size of pot, which bud to take out, and will be invaluable to the Gardener as well as the Amateur. It will also contain beautiful Illustrations of New Varieties, as well as several new features. and

Will be posted to Customers free immediately it is ready.

This is produced at great cost, and not being one of those who can give **SOMETHING FOR NOTHING,** I will forward it to non-Customers, post-free, for seven stamps.

CHRYSANTHEMUMS.

STERLING NOVELTIES FOR 1895.

MRS. W. J. GODFREY.

Without doubt the most beautiful Japanese and the purest white variety in existence.

Fully described in CATALOGUE, Post-free.

Miss RITA SCHROETER

Raised by CHAS. C. SHEA, Esq., from whom I have purchased the entire stock.

This variety is the only English-raised Japanese not yet in commerce. Certificated at the Grand Exhibition of the N.C.S., on November 7, and it certainly is the most striking novelty of the numerous varieties certificated on that date. The blooms, which are large, may best be described as a glorified "Belle Paule," which it much resembles in colour and markings, but of double the size. Of first-class habit of growth, and an easy "doer" in every respect.

Plants only 7s. 6d. each

Full List of Novelties, and the Best of Older Varieties, post-free.

W. J. CODFREY, EXMOUTH, DEVON.

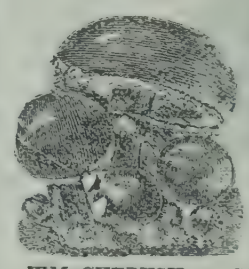
BRAISWICK NURSERY, COLCHESTER.

NEW AND BEAUTIFUL HARDY SPIRÆA.

SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corymbs thickly on the plant.



It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.

FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.
Nice plants, 7*s.* 6*d.* each, will be distributed in November.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

Flower Painting.

MISS MARIE LOW, F.R.H.S. (Medallist and Exhibitor), having great experience in drawing plants and flowers of every description from Nature, is prepared to execute Drawings in Oil or Water-colour, of Choice and Rare Plants, &c., at owners' gardens, or from specimens sent to her. For examples of reproduced work see *The Garden*, 1891 and 1892, plates 824, 828, 832, 833, 843, 844, 845, 846, &c. Miss Low also gives Private Lessons in Flower Painting by a method which ensures rapid and successful results to her pupils. For terms and further particulars, address—
34, Oppidans Road, Primrose Hill, London, N.W.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.—Everyone can readily grow Mushrooms, and by using this Spawn will ensure success. All growers speak in high praise of the quality. Numerous Testimonials. B. S. WILLIAMS & SON
Victoria and Paradise Nurseries,
UPPER HOLLOWAY, LONDON, N.

SMALL SHRUBS and CONIFERÆ.—Ampelopsis Veitchii, 6 in., 60s. per 1000; Aralia Sieboldii, from pots, 6 to 8 in., 12s. per 100; Box Tree, Green, 6 in., 60s.; Cup. macrocarpa, 1 yr. trans., fine, 10 to 15 in., 80s. per 1000; Cup. Allionii, 6 in., 6s. per 100; gracilis, 6 in., 7s.; erecta viridis, 6 to 7 in., 40s.; Cotoneaster microphylla, 1 ft., 35s. per 1000; A. Douglasii, 1-yr. tr., fine, 7 to 12 in., 80s. per 1000; Dracæna australis, 8 in., 10s. per 100; Escallonia macrantha, 9 in., 10s.; Eulalia japonica, 9 in., 4s. per 100; Guelder Rose, 1-yr., 6s.; Honeysuckle, Common, strong, 6s., H. japonica, strong, 12s. per 100; Ivy, Irish, 15 in., 6s.; Laurustinus, 7s.; Olearia Haastii, 6 in., 10s.; Pinus excelsa, 2-yr., 6s.; Cephalonica, 1-yr., 6s.; Rhododendron ponticum, 3-yr., 25s. per 1000; 4 to 5 in., 40s.; Thuia Lobbii, 12 to 15 in., 25s.; 15 to 18 in., 30s.; Ellwangeriana, 8 in., 40s.; Virginian Creeper, 1-yr., 6s. per 100; Yucca gloriosa, from pots, 6 in., 10s.
GARLIES MITCHELL, Nurseryman, Stranraer.

FRUIT TREES A SPECIALTY.
An immense stock of all the best varieties for Garden, Market, or Orchard.
Special quotations for quantities to grow for MARKET.
NEW and RARE Sorts, NOT OBTAINABLE elsewhere.
APPLES.—A grand stock of Standard and Half-standards, Dwarfs, Cordons, and Trained.
PEARS, PLUMS, CHERRIES, PEACHES, APRICOTS, in all forms.
GOOSEBERRIES, CURRANTS, and RASPBERRIES.
STRAWBERRIES.—All the best of the old and new varieties, open air plants, or in small POTS.
Send for Descriptive List and Guide, post-free, 6d., gratis to Customers (one of the most complete issued). Ordinary List free.

THE
Gardeners' Chronicle.
SATURDAY, NOVEMBER 17, 1894.

A RECTORY GARDEN IN ESSEX.

THERE seems room for yet another book on horticulture. A taking title might be "The Rectory Gardens of England." How beautiful they are! In lecturing for County Councils, judging at rural shows, visiting cottage gardens, and allotments, one has the pleasure of inspecting many rectory gardens, as also those of the squires and large farmers.

Cultured tastes and eyes have chosen the rectories of to-day as they did the monasteries, nunneries, and abbeys in olden times. Modern vicars and rectors, like the older ecclesiastics, are also members of the gentle arts and skilful guilds of horticulture.

The pressure of the modern difficulties of living have not been felt in vain in the rectory gardens of to-day. There may, perhaps must be, more utility in modern rectory gardens. But surely there need not be less of beauty, inasmuch, as most of our gardens are also crowded, overflowing with beauty. The orchard in blossom or in fruit runs even the rosary hard in the field of beauty, and pleasure and profit are everywhere running a friendly race for more room and richer developments in our best gardens. Bare earth, green grass, especially around rectories, are plentiful and cheap, living plants crowding round, waiting for the touch of taste, the inspiration of genius, to mould the raw materials into growing landscapes overflowing with life and beauty. The makers of the latter mostly get more than they bargain for. They may have planted for shelter, shadow, health, profit, and they reap a veritable Eden of rest, retirement, pleasure, beauty as well. And these living landscapes fade not with the passing years, but mellow into a softer, richer, beauty as time softens their colours, or deepens their shadows. But whether site inspires culture or culture site, the two between them have converted many rectories into homes of beauty. I have been several times in Essex of late, to look for derelict farms. So far, I have chiefly found land in creditable cultivation. Fields of Roses, fairly cultivated small holdings, and tastefully and fully-furnished rectory-gardens. I am enabled to give this local habitation and name of the garden I describe.

The Wakes-Colne Rectory is within about a quarter of a mile of the Chappel Station and junction of the Great Eastern Railway, with which travellers by the Great Eastern from Bury to Marks Tey, are familiar. The rectory, however, is hardly seen from the station. It is near the entrance of the Colne Vale Railway, famous for its fine viaduct here, and the cluster of Colne parishes. For instance, there is the Colne Le Blanc or White Colne, Colne Engain, and Earls Colne, the latter not only being the largest of the four, but larger than the other three together. Earls Colne is also the oldest and most important,

with a history running back to the time of Edward the Confessor; the common name of all being derived from the River Colne, that runs through the valley.

Wakes-Colne is on the highway between Cambridge and Colchester; 8 miles from the latter, 9 from Halstead, and 6 from Coggeshall. The living is a rectory, including 12 acres of glebe land, and the church All Saints has a nave, chancel, spire, and bells. There are several charities and good schools, and a nice schoolhouse recently built. The parish is a large one, covering some 1800 acres, and a shrinking population. Among other means of benefiting his parishioners, the rector offers five prizes every year for the cleanest, best-stocked, and cultivated gardens owned by or let to labourers, railway servants, or widows. These prizes consist of 7*s.* 6*d.* for first, 5*s.* for second, 3*s.* 6*d.* for third, 2*s.* 6*d.* for fourth, and 1*s.* 6*d.* for fifth. Five more prizes of the same amounts are offered for allotments under the same conditions.

One of the most striking features of these competitions was the number and excellency of the widow exhibitors.

These prizes are to be awarded at the Four Colnes shows in the autumn, when the four villages will combine their resources to have a friendly contest with each other—a far better plan than each small village attempting to stand alone in such matters. By such, and in other ways, Dr. Bartram, the rector of Wakes-Colne, for twenty-four years, the head master of the Berkhamsted School, endeavours to improve the science and practice of gardening throughout the parish and district. But the Rectory garden furnishes the most potent object-lesson, and with the assistance of a good gardener, and other helps, Dr. Bartram succeeds in placing examples of horticulture before his friends and neighbours worthy of their careful imitation. The area under culture is about 3 acres, and every part of it, whether in the open, or against walls or fences, is occupied with a crop of some sort. Roses may be said to be used as a sort of packing-material between other crops, where little or no space is left, as well as for forming brilliant masses of colour and fragrance, near to doors and windows. As the Doctor had the assistance of Mr. Mawley, Secretary of the National Rose Society, it is hardly needful to add, that the selection is one of the choicest and the best.

Dr. Bartram has happily caught the prevailing art of utilising space to such good purposes as to form a nice fernery under a large tree on the lawn, and the same principle is constantly seen in bed and border, nooks and corners of walls and fences. Wherever a foot of space can be found, a cordon-tree, bush, or plant is packed into it.

Waste not want not seems writ large all over the rectory garden, and it is made to apply to waste products, as well as sweetest flowers and most luscious fruits; thus the garden fills the house with plenty, the house and stables replenish the orchard with strength. Other rural industries, such as bee-keeping and fowl-farming, are in full swing at the Rectory, the Doctor being as much at home in selecting a queen or hiving a swarm as in pruning or training a Rose or fruit tree. The bees, too, help to set the fruit, the fowls to feed and cleanse it, as they run in hungry swarms through the orchard.

Space would fail to descant upon the prodigal supply of Roses and other flowers, the liberal use made of them in the Rectory house, the beauty of bed and border, snug shelter and seclusion secured for lawns and tennis grounds, and the security for fruit trees and borders begotten, as it were, of absolute reliance on the honesty of the public, furnish a striking example of the potency of trust as a means of safety and security for gardeners and their produce.

The area under culture extends over about three acres, including the rectory stables, one cottage for the gardener, and other buildings. The following are the chief trees and bushes used to furnish this area.

Nine hundred and fifty Cordon Pears on the Quince, some of these are arches, alternating with Apples, and doing well; 25 Cordon Apples on Paradise stock, 55 Standard Apples in orchard on Crab, 8 Pears on Pear, 250 Bush Apples on Paradise, 45 Bush Pears on Quince, 28 Bush Plums, 192 Gooseberries, 122 Black Currants, 8 Red Currants, 125 Damsons, chiefly Fairleigh's Prolific; 2 standard Cherries, 2 Crabs, Transcendant and Dartmouth; 3 standard Apricots on walls, Doyenné du Comice Pear closely trained to gardener's cottage, fine fruit; Peaches Early Alexander, Royal George, Noblesse, Reliable, and Morello Cherries.

Among the finer Pears were Louise Bonne of Jersey, Durandeau, Pitmaston Duchess, Souvenir du Congrès, Doyenné du Comice, Bellissime d'Hiver, Duchesse de Angoulême, Beurré Clairgeau, Beurré Diel, Easter Beurré, Thomson's Catillac are well grown. Almost every cordon laden with fruit, breast or current year's wood pinched back to six or seven leaves about the end of June or early in July, and finally to three leaves early in September.

Of Apples, Dr. Bartram finds the Duchess of Oldenburgh and Stirling Castle the most productive, and the Ribston Pippin as disappointing and slow in coming into bearing; Bramley's Seedling and Lord Derby likewise do remarkably well planted close to a boundary fence, the hedge being hard cut back, to prevent the fly getting on to the Apples through contact. Cordon Apples, standards, bushes, Gooseberries, Currants, with a preventative and cleansing dressing of hot lime at the rate of 100 to 50 soot, with sufficient melted grease and clay to make the mixture stick. Plums are syringed overhead in winter with lime-water, to prevent insect pests, the eggs of which the microscope reveals early in February.

The cordon Pears and bush Apples on the Paradise are among the more striking features of this fully-furnished garden, and the produce of both, if carefully thinned and marketed, might pay expenses, and leave a rich revenue of pleasure, and home supplies. How rich and full the pleasure of such gardens are will be apparent when it is stated that 300 or more choice Roses were grown.

Among the greatest favourites were Grace Darling, The Bride, Souvenir de Thérèse Levet, Madame Lambard, Marie Van Houtte, William Allen Richardson, Gloire de Dijon, &c. Ulrich Brunner, La France, Viscountess Folkestone, the old white Scotch yellow Persian, Harrisoni, Gloire de Polyantha, and many more all greatly admired by visitors. Roses thrive remarkably well in this part of Essex, owing, it is thought, to the predominance of iron in the soil. Even the wild Roses grow in the hedges with a vigour, and bloom with a prodigality such as is seldom met with in other counties. In a long drive through the parish of Wakes-Colne, assessing the merits of cottagers' gardens and small holdings, we scarcely once lost sight or smell of wild or garden Roses.

Not a few expert budders were found converting wildling Briars into garden Roses for the supply of their own wants, and those of their neighbours. More fruit-trees and bushes, larger area for the cultivation of vegetables, are, however, still needed in the Colne Valley. *D. T. Fish.*

New or Noteworthy Plants.

BOLBOPHYLLUM PERPUSILLUM, *Wendl. and Krnzl.**

With the exception of Bolbophyllum Odoardi, Pfitz, this new species is certainly the smallest Bolbophyllum we have any notice of. The creeping stems are thinner than ordinary silk thread; the bulbs and the leaves are one to two lines in length, and the leaves about half a line in breadth. The pedicel is also very slender, and the flower is, in spite of the tails of the sepals, a very inconspicuous one. The most striking character is the very prominent soft-haired callus of the lip, which occupies nearly the whole disc except the very edge, and this character will be regarded as sufficient to distinguish the species from all the others hitherto described. It flowered for the first time in June, 1893, at Herrenhausen, under the careful cultivation of Mr. Wendland. The plant was found and sent home by Mr. Johannes Braun. *F. Kränzlin.*

Bolbophyllum Johannis, *Wendl. and Krnzl.*†

This plant is also one of the discoveries of our unfortunate countryman Mr. Johannes Braun, who died at Antananarivo some years ago. I received fresh material from Herrenhausen, the inexhaustible source of rare botanical Orchids, many of those there existing being in some cases the only living specimens in Europe. The sides of the column running downwards and united with the base of the lip, are very peculiar, but the only characteristic of botanical interest by which this species may easily be distinguished from others. To reproduce the whole description of this little thing is of no use, as botanists will recognise it by its characters given in the appended foot-note. *F. Kränzlin.*

Trichomanes (Didymoglossa) solitarum, *Jenm., n. sp.*

Rootstock threadlike, freely repent, sinuated, tomentose, and much branched; fronds dark dull green, abundant, scattered; stipites 1 to 1½ line long, rusty like the rootstock; blade 2 to 3 or 4 lines long, 1 to 2 lines wide, the base freely cuneate, barren ones lanceolate, entire or indented, fertile ones bat-like, the sides spreading and incised, deeply cleft and open at the top, with a solitary stipitate entirely-free sorus in the cleft, within or much protruded; midrib evanescent above the base, veins fine, close, flabellate, forked; involucres urn-shaped, with rounded club-like lips. Jamaica.

---

* *Bolbophyllum perpusillum*, Wendl. and Krnzl.—Caule primario repente filiformi tenuissimo bulbis segregatis subglobosis obliquis diphyllis; foliis lanceolatis acutis, bulbis 2 mm. diametro, foliis 2—3 mm. longis, ½ mm. latis; pedunculis multo longioribus tenuissimis erectis unifloris; bractea ovata acuta quam ovarium longiore; sepalis ovato triangulis in caudas ipsis æquilongis angustatis; petalis multo minoribus oblongis obtusis, labelli epichilio ovato obtuso basi complicato utrinque rotundato, per totum epichilium a basi callo crasso apicem obtusum usque decurrente minutissime piloso pone basin sulcato; gynostemio generis; dentibus androclinii omnino obsoletis. Totus flos 3 mm. longus, albidus, petala levissime roseo-suffusa. Madagascar leg. Joh. Braun vir beatus.

† *Bolbophyllum Johannis*, Wendl. and Krnzl.—Caule primario v. rhizomate tenuissimo repente, secundariis, 5-bulbis minutissimis approximatis irregulariter globosis obliquis monophyllis; foliis oblongis acutis; bulbo 2—3 mm. diametro; folio 3 mm. longo, 2 mm. lato; scapo filiformi erecto squamis 1—2 vestito unifloro; bractea ovata acuta, quam ovarium breviore; sepalo dorsali lineari-oblongo acuto, sepalis lateralibus paulo longioribus angustioribus carinatis; petalis duplo minoribus oblongis obtusis, labelli hypochilio v. pede satis producto, epichilii ungue lineari angusto canaliculato, epichilii lamina expansa late ovata basi cordata, lineis 2 paulum prominentibus in disco; gynostemii margine utroque in labelli hypochilium, descendentibus foveam stigmaticam profundam efformantibus. Totus flos inter minimos generis, albidus, vix expansus 3 mm. diametro. Madagascar leg. Johanes Braun vis beatus.

Discovered by Mr. Syme several years ago, locality not recorded. Communicated by Mr. Hart. The barren fronds of this might easily be taken for those of T. setiferum, the two species being of like diminutive size, but the fertile fronds of each are quite different, this one resembling a pair of spreading incised wings, with the free sorus extended or not, neck and head—as of a water-bird when flying—in the deep cleft between. Occasionally a fertile frond is linear. *G. S. Jenman, Demerara,* 1894.

DENDROBIUM HARVEYANUM.

This handsome species, of the D. Brymerianum section, is even more quaint in appearance and in the arrangement of the delicate fringing on its clear yellow flowers than D. Brymerianum, which was so eagerly sought and much valued for years after its first appearance, and which even now causes great admiration whenev r it is sufficiently well grown to develop to the full the branched fimbriation of its lip. In D. Brymerianum the fringing is confined to the lip, but in D. Harveyanum it is comparatively restricted on the labellum and more displayed on the petals—a most unusual development in the genus, and one which probably originated in a sport or abnormal form, perhaps of D. Brymerianum itself.

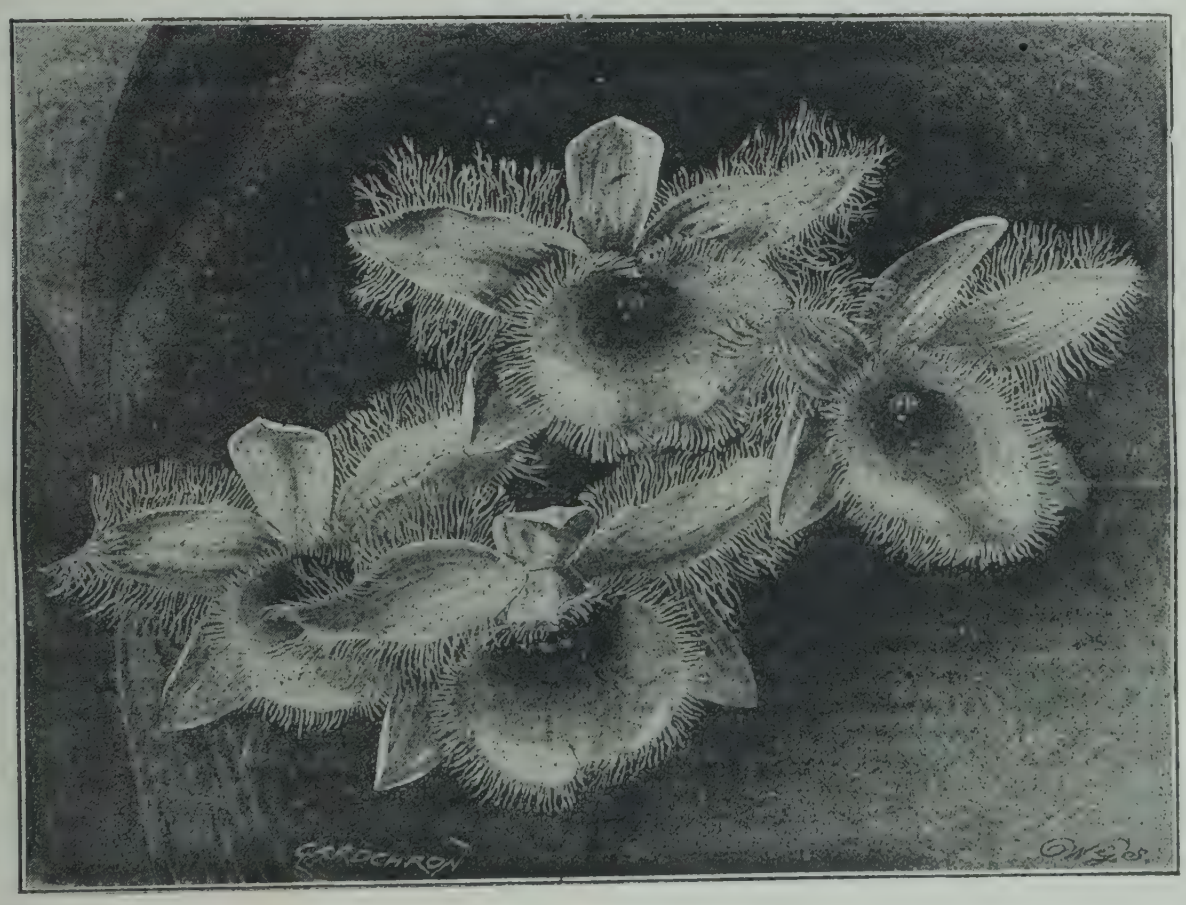

Fig. 76.—DENDROBIUM HARVEYANUM: FLOWERS YELLOW.

D. Harveyanum requires the same treatment as the other Burmese species, that is to say a good free growth in a warm moist house in the growing season, and a proportionately long cool and dry resting time after the growth is completed.

It was first imported in 1883 by the Liverpool Horticultural Company, and it was named in honour of Enoch Harvey, Esq., of Aigburth, Liverpool.

The photograph from which our illustration (fig. 76), was prepared, was kindly sent by the Rev. F. D. Horner, Lowfields, Burton-in-Lonsdale, who has grown the plant with considerable success.

THE SEED TRADE.

The Garden and Root-Seed Harvest.—A severe frost late in spring, that left its mark wherever experienced, and which was followed by a most ungenial summer, accompanied with occasional heavy downpours of rain in excess of the average, has served to aggravate what appeared to be a serious position for the grower of the more tender classes of seeds; and now that the harvest, generally speaking, has been gathered in, we are within reasonable distance of being able to give some definite information upon the outcome of what cannot be otherwise described than an extraordinary season.

Broad Beans, so largely grown in the rich alluvial deposits lying inland from the mouth of the Wash, are under the average again this season, the plant although hardy was considerably affected by the late frosts, and the check influenced the black-fly to an alarming extent; this circumstance followed by a wet harvest, has practically spoilt the size and colour of the Beans, and clean bright samples from any part of the country are few and far between. The Long-podded section is now so largely produced in sunnier climes, that the outcome of our home-grown crops scarcely affects the market. Scarlet Runners will also be short, the wet autumn, and a taste of early frost helping to ruin what might otherwise have been a large crop. This Bean is now so extensively grown on the Continent, that shortcomings here are likely to be met sufficiently to prevent such famine prices ruling next spring, as prevailed at the end of last season. The commoner kinds of dwarf Bean are now grown in so many parts of the world, that it is difficult to form an estimate; Europe, however, has by no means a full return, and the Colonial supplies that found their way here last season were cleared at such low figures that the growers may hesitate to take another bite at English markets.

Beet is but sparingly grown in this country for seeding purposes; excepting a few extra special strains, and these chiefly for stock seed use, the area scarcely influences values. It is to the Continent that we have to look for our bulks, and there seems to be a poor crop again this season in most countries, which is hardly a cheerful outlook, considering how bad it was everywhere last year.

Cabbage, Kale, and Brussels Sprouts are all largely grown in the Eastern Counties, at the same time their cultivation is by no means restricted to this area. At one time it was thought there was to be a heavy yield, the like of which had never before been known; a cold and cheerless time, however, supervened when the flowers were in need of warm sunshine, which caused many to drop and wither without setting—the pods that were formed were found to contain many thin, weak, and undeveloped seeds, which, when they came to be cleaned, helped materially to lessen the bushels per acre. The Essex crop seems to have turned out the best, whilst the Continental crop is under average in most countries. Broccoli, also grown chiefly in the eastern side of the country, is under the average; whilst Cauliflower, a plant but sparingly cultivated for seed here, is reported to be fair abroad.

Carrot seed is always late in a wet autumn, as the umbelliferous seed-heads retain moisture to such an extent that they are with difficulty dried until some time after being cut; and from this cause the crop is certain to run short when threshed. The finer garden and frame varieties, which are mostly grown in France, yield, from all accounts, a not over satisfactory result, some sorts being quite a failure.

Leek and Onion were both remunerative seed crops in this country at one time, but the adverse seasons of the past few years have disheartened growers, and, as a consequence, the industry is lessening. This has led to an enormous increase in their cultivation on the Continent, both France and Italy growing extensive areas of seeds and selected bulbs, to supply our needs; but they find some difficulty in perpetuating our best English kinds, even when stock seeds are first of all supplied for the purpose. The Californian crop appears to be an average one, but it only affects us after the American home demand is satisfied. Lisbon Onion, the variety grown in such quantities by market-gardeners for bunching in spring, is a short crop, and the difficulty is likely to be somewhat increased by an attempt to "corner" available supplies.

Lettuce is under the average everywhere, but a sufficiency is expected, as this seed is now largely produced on the continent, in America, and also in the Antipodes.

Of Mustard, both the white and brown variety are largely grown in the districts bordering The Wash, and at the annual market held at Wisbech a week or two back, the crop was reported a large one, although many samples were somewhat discoloured. Values, however, were kept down by the enormous increase in the English acreage, and the quantities that come into our markets from Holland, Russia, and South America, and the outlook is not encouraging for an extended area to be put out at home next season.

Parsnip and Parsley are fairly good crops, both at home and abroad; and so is Radish, so far as it was safe before the wet set in. The delicate sorts are always uncertain, and although largely grown on the continent, are never produced in a sufficient quantity to meet all demands.

Spinach is a very short crop at home; the bad weather that has overtaken the counties of Essex and Kent, where it is chiefly grown, has seriously prejudiced the finishing off of the plants, already somewhat crippled by the June frosts. The varieties grown in the Hook of Holland are reported a fair return.

The garden varieties of Turnips are fairly satisfactory, although the return is not nearly so large as was at first estimated, as so much threshing out of light and sickly seed was needed. An increasing demand from abroad for certain popular kinds has also helped to keep values steady.

Probably no crop suffers so much in a bad season as that of Peas, and there is no doubt, so far as our own growths are concerned, that it is both short and poor in quality. Rubbed-out samples of the early round sorts that have come into our hands are very disappointing; the wrinkled varieties are hardly yet in condition for threshing, but these too will be found wanting in size and colour through being stocked too full of moisture—the bine of many of the newer kinds being so strong, that they cannot be sufficiently dried in a dripping season. In view of the great demand in all directions, it is fortunate that

*

the Pea acclimatises so readily, and were it not for the large areas produced in several parts of the world, we should, indeed, be badly off. Adverse seasons, however, affect results, even in these more favoured climes, for the Canadian crop has turned out wretchedly poor, whilst the last New Zealand harvest gave about one-half the average yield. The German and Dutch crops seem fairly good, but as many growers in these countries pay such little attention to rogueing, it is dangerous to handle their bulks unless from the most reliable sources.

Potatos were lifting badly everywhere; the heavy rains having so soddened the earth, that in districts which lie low, and carry a retentive soil, the sight of the tubers rotting from disease was disheartening, and those that are pitted or pied are certain to open out badly. In many of the Fen districts many acres were hardly worth lifting.

Of flower-seeds, all that were garnered early are fairly safe, the later maturing kinds, such as Nasturtiums, are having a bad time of it, so that it will be necessary to rely for main supplies upon places abroad; in both France and Germany the results all round seem more favourable. Sweet Peas and other flowers are being so largely cultivated for seeds in California, that there is every likelihood of a plentiful supply for all demands.

As to agricultural crops, the Mangel is likely to turn out much better than it did last year, although yielding by no means a full average; this plant is always late upon the land, as is necessary for the full development of the seed. Those growers who feared the wet autumn, and cut before the seed was nearly ripe, will find themselves saddled with a quantity of green capsules for which it will be difficult to find a market. In view of the remunerative figures ruling last season, a large area of plants was put out, and so there is likely to be a sufficiency. The continental crops are somewhat short, but taking things all round, it is anticipated there will be enough for ordinary wants.

The harvest of Swedes and Turnips has been one of the best for the last few years, and had it not been for the sharp frosts that visited us at the end of spring, there is no doubt the crop would have been a record one; as it was, the flattering estimates made during rogueing time had quite another complexion put upon them, when the seed came to be threshed, a good deal was found to be thin and weak, so that the ultimate returns do not average beyond two thirds of the original estimate. Such a large area was cropped, and prices have gone down accordingly, that the merchants have a fine opportunity of filling up their empty floors at remunerative figures. The French crops are fairly good, but these strains are ill-adapted for many parts of our variable climate. *Seedsman.*

Orchid Notes and Gleanings.

CATTLEYA VICTORIA REGINA, *Reichenbachia*, t. 85.

In Mr. Rolfe's opinion this is a hybrid between C. labiata and C. Leopoldi pernambucensis. These and other Brazilian Cattleyas require a pure and not too moist atmosphere, a bright light in the morning and evening, careful watering, but no syringing. Messrs. Sander themselves doubt the alleged hybrid origin of the plant, and have put the matter to a test by crossing C. labiata with C. Leopoldi pernambucensis. The result will be interesting.

Zygopetalum Klabochorum, *Reichenbachia*, t. 86.

This Orchid requires a moist, shady house, of an even temperature, ranging from 60° to 70°, the whole year round, and in hot weather a slight dewing over with the syringe in the early morning and in the evening. It may be grown in baskets or in pots, but in the material used for them quite one-half of living sphagnum should be given, the other portion being fibrous peat. Care should be taken not to subject them to bright sunlight or cold currents of air.

Lælia autumnalis var. alba, *Reichenbachia*, t. 87.

It is suggested that the Mexican Lælias may be grown in an ordinary greenhouse. The rather dry air and bright light of the ordinary conservatory suits the Mexican Lælias, and the chief cultural item to be observed is to give the plants a most liberal supply of rain-water at the roots while making new growths, and until such growths are matured. They should be placed in a cool and airy situation, scarcely any water given till the flowering season comes round again. The present form is a very beautiful one, the sepals and petals, and even the lip, being pure white.

Spathoglottis Kimballiana, *Reichenbachia*, t. 88.

The flowers of this showy species have been likened to those of a yellow Phalænopsis. The plant is a native of Borneo, and is best grown in Orchid pans in a compost made up of equal proportions of fibrous loam, good peat, and living sphagnum, with a little silver sand. The plants should be suspended within 3 feet of the glass of the roof in a moist house, where the temperature ranges from 65° to 75° F., and kept there the greater part of the year, being liberally supplied with moisture at the roots. It is well to give them a resting-season in a cooler and more airy house, where they may be kept comparatively dry for a month or so.

Peppermint Culture.

In these days of depression in agriculture, when owners of land and cultivators of the soil are at their wit's end to know what crop to grow for a profit, or to what use they may apply the land they possess, it is somewhat strange that more attention is not directed to the growth and production of all the finer essences and perfumes in which France now holds a monopoly.

The Peppermint known to botanists as Mentha piperita is a plant common in many parts of Great Britain, but yet its cultivation has never made much headway in this country.

We learn from a report by Mr. J. K. Reeve in the *American Agriculturist* that, about sixty years ago some Connecticut farmers, emigrating to Western New York in search of more fertile lands, found the Peppermint growing wild in great abundance along the edges of the streams. In their own district they had already been accustomed to cultivate it in a small way, and to distil the essence, and the fact of its prolific indigenous growth suggested to them the natural adaptability of the soil to its production, and they began to plant and cultivate it.

From that time the industry has steadily grown until now, in that county alone there is annually cultivated an average of about 6000 acres, rising occasionally, when high prices stimulate production, to 8000 acres. As a great deal of labour is required upon a small area, most of it is grown in small patches, as an adjunct to the general work of the farm, instead of being made the principal crop. In this way, some 2000 cultivators are engaged in its production. As each acre under Peppermint culture requires the entire labour of one man for one month, and as the entire crop demands immediate attention at certain times, the grower must have considerable capital, and be certain of plenty of available labour when most needed, before he is warranted in entering upon the work to any great extent, and as both product and price are exceedingly variable, farmers ordinarily are not disposed to take the financial risk incidental to the cultivation of a large area.

An average yield of Peppermint is about 1 ton per acre, of air-dried plants, which will produce about 20 lb. of oil when distilled. From this the yield ranges, according to season, from 10 lb. or less, and has been known to go as high as 45 lb. of oil per acre. At Mitcham, in Surrey, the great centre in this country for the cultivation of medicinal plants, and the manufacture of essential oils, the average production is 17½ lb. of Peppermint-oil per acre. It is probable, however, that if the financial aspect of the industry were more favourable, other localities would speedily be found where the soil, treated by the best methods of cultivation, would respond generously to the Peppermint-grower. Weeds are the great enemy to success, and the habit of growth of the plant is such that its profitable cultivation is almost impossible upon foul land. Low, rich, marshy land is the most suitable for it. This should be ploughed in spring, and shallow furrows may be drawn 30 inches apart.

In these the sets, which are portions of old plants, are strewn so thickly that they touch in the rows. This work may be done in March or April, as soon as the ground can be got into proper condition. Cultivation consists in keeping the ground clean until the plants, by tillering, have taken entire possession of it. After that, the only thing that can be done is to weed by hand. The land is generally cropped two, but sometimes, three years, from one plant-setting. After that the soil usually becomes so foul that the quality of oil produced would not be good enough to pay for harvesting.

The first crop is, in this respect, of course, the best of all. The Mint ripens when about 2½ feet high, and is harvested about September. Having been cut, it is raked into small heaps, allowed to wither, and then taken to the still, which extracts the oil.

Besides its medicinal uses, Peppermint-oil enters largely into the manufacture of confectionery, perfumery, essences, and cordials. *J. J. Willis, Harpenden, Herts.*

Orchids at Cambridge Lodge, Camberwell.

The very large and healthy collection of Orchids belonging to R. I. Measures, Esq., affords a good example of successful Orchid cultivation in the neighbourhood of London. Some species, notably Miltonia vexillaria, M. Roezlii, and other plants of a similar nature, require unremitting attention in the season of fogs and darkness, so as to keep them healthy; others, on the contrary, flourish with such luxuriant vigour, and are in so much better condition than they are generally found even in country gardens, that one is almost tempted to imagine that London air suits them best. The most striking example of the latter fact is the collection of Vanda tricolor and V. suavis, the varieties of which nearly fill the house devoted to them. Some of them are still in bloom, and the plants, one and all, possess hard, dark green foliage from the bottom of the stems upwards—as sure an indication of good culture and perfect health in Vandas as long, naked stems are of improper treatment and unsuitable quarters. The other species of Vanda are in equally good condition, viz., V. cœrulea, a grand specimen of V. Denisoniana, V. Kimballiana, and V. Amesiana having remarkable vigour.

Another example of good results not to be excelled in any other part of the country is in the Cymbidium-house, where the huge specimens of most of the species are in very fine condition—most of them now out of bloom, although a specimen of C. Mastersii is carrying ten spikes of flowers; and the rare C. cyperifolium is in bud.

But what may be called the two great specialties at this place are the Cypripediums and the Masdevallias, which form one of the largest and most varied collections in this country. Many of them are still in bloom, and scores of plants in hanging pans, &c. The Masdevallia Chimæra section afford flowers ranging from pale yellow, spotted with chocolate, to the nearly black of M. c. Roezlii. M. attenuata, M. Laucheana, M. muscosa, M. elephanticeps, M. melanoxantha, M. corniculata and its variety, inflata, M. × Measuresiana, and others were in flower; and numbers of M. tovarensis are covered with buds. Among specially-prized species were M. Lowii and M. O'Brieniana; and in the Masdevallia-houses were a very great number of Pleurothallis, Stelis, Restrepias, and other miniature plants, many of which were in flower.

In the several houses set apart for Cypripediums, both the species and hybrids are in splendid condition; the larger Selenipediums having foliage almost as robust, and quite as ornamental as a Phormium

In the "seeding" house are hundreds of seedlings, ranging in size from those in the seed-pans to the plant just ready to flower. Cypripedium bellatulum, and that other fine variety C. Godefroyæ leucochilum, of which there is a good batch, have been largely used in the hybridising, and good results are certain to accrue. The side of one of the houses is entirely filled with fine forms of C. insigne, among which in bloom were C. i. Ernestii, which may be called a C. i. Sanderæ with clear yellow and white flowers, possessing the form of C. i. violaceo-punctatum. The true C. i. Sanderæ is in bloom, and forms a good companion to the last-named variety; and another yellow-flowered C. insigne near to C. i. Hardyana is also in bloom. Of the differently coloured forms, C. i. Cambridge Lodge variety, with handsome purple-spotted upper sepal, is one of the best; and C. i. nigro-maculatum, one of the darkest coloured. In the same house was a plant of C. × Arthurianum, with eight flowers; one of the remarkable clear yellow-coloured C. venustum Measuresianum; some fine varieties of C. × Leeanum; and a noble plant of Oncidium ornithorhynchum album with seventeen spikes.

In the other Cypripedium houses several forms of C. × Bellona, C. × œnanthum superbum, C. × Swanianum, C. × regale, C. × Cretheus, C. × Pitcherianum, C. × tesselatum porphyreum, C. × Seegerianum, C. callosum, and others were in bloom.

In point of showiness, the Cattleya and Lælia houses were the most brilliant. The autumn flowering varieties of Cattleya labiata was apparent in quantity, and in a variety of good forms. The hundreds of flowers observed display much variety and excellence; but in point of beauty the new white C. labiata, R. I. Measures variety, takes the lead, the peculiar primrose tinge at the base, and the faint pink pencilling in front of the lip, rendering the otherwise quite white flower very distinct.

In the other houses we noted Nanodes Medusæ, which Mr. Chapman, the gardener at Cambridge Lodge, says gives no trouble if grown cool; Lælia superbiens, which here flowers every year; a quantity of spikes of different varieties of L. anceps; L. tenebrosa, a huge plant of Cœlogyne cristata alba, with perfectly plump pseudobulbs, which will be a glorious sight when in bloom; an equally huge C. tomentosa, which bears long racemes of salmon-coloured flowers; C. Massangeana, in bloom; and fine plants of Oncidium tigrinum, with very stout spikes of large flowers.

CHRYSANTHEMUMS ABOUT LONDON.

(Continued from p. 566.)

Messrs. H. Cannell & Sons.—As is usual in this well-known nursery at Swanley, there is a large number of Chrysanthemums in the great span-roofed house used for the purpose of their display. Seedlings are raised annually in very considerable numbers, a fact evident from the number of plants already turned outside, where they are developing flowers whose quality, or lack of such, has doomed them to oblivion. In seed experiments, however, a certain amount of failure is expected. The other side of the picture shows plenty of promising varieties, which will be given liberal treatment with a view to bringing them out next season. Kentish White (1893) is one of these latter, for it will give much disappointment if it fails to make one of the freest and best of the white Japanese incurved section. Colonel Curzon (1894) is a good bold rose-coloured flower with silver reverse, also an incurving Japanese.

Jeannie Pearson (1894), with flower of the same type as the previous ones, is somewhat a novelty in colour, having yellow florets, tipped slightly with green. Another season will prove if such as these now noticed will be of any use commercially. Jno. Machar has already been seen at the exhibitions, and is a good large Japanese incurved of bright but rich yellow; and Globe d'Or is even a greater acquisition, being a large and regular incurved bloom of a rich golden-yellow, suitable for exhibition, and apparently more easily grown than some of this section. Both of the last-named varieties have been certificated by the National Society. A sport from Cullingfordii, having larger blooms and broader florets, slightly hirsute, is suitably known as Cullingfordii Improved, the well known colour of the type being preserved in this variety. There are several hairy varieties, the result of seedlings (continental) from Mrs. Alpheus Hardy, among which Belle Arlesienne appears likely to be very good. It is a Japanese incurved, of rosy-lilac, apparently larger and more pleasing than Louis Bœhmer. Mr. Cannell says the large Primrose League has given a yellow sport, but this was not in bloom at our visit.

Queen Elizabeth is an extra large Anemone bloom of blush-white, cushion suffused with sulpher. The collection has a large number of the season's novelties in flower, and we can only briefly mention some that are remarkably good, descriptions of which, in most cases, have been written in previous notes. Commandent Blussett, Leviathan, Pearl, Beauty, M. Panckoucke, Mrs. E. G. Hill (very excellent), Good Gracious, Alice Seward (capital), M. Chas. Molin, represented by a first-class bloom; Madame Octave Mirabeau, Robt. Owen, just bursting very large buds; Madame Ad. Chatin, John Bunyan, an excellent Anemone-flowered yellow sent out by Mr. Owen, of Maidenhead; Ernest Cannell, a Japanese incurved; and Amy Chantler. Madame Vessière, a variety from the Continent (1894), is a dark-coloured Colonel W. B. Smith, but not superior to that excellent variety. Gabriel Viaud (1894), may be liked as a Japanese reflexed, with colour similar to Edward Audiguier. Other attractions at Swanley at present consist in the unique display of zonal Pelargoniums, collections of Cannas, Salvias, and many other plants in bloom.

Dover House, Roehampton, S.W.

In these admirably-kept gardens, belonging to J. P. Morgan, Esq, the Chrysanthemums this season are even better than previously. As many as 1500 plants have been grown, and almost all the best of the novelties may be remarked; indeed, the collection is thoroughly up to date. Before noticing a few of the flowers, remark may be made upon the excellent habit induced in the plants, which are dwarf and strong, and in most cases carry more first-class blooms on each than is usual.

The best of those in flower when we saw them a week ago were in the fruit-houses, and the display suffered in some degree from the character of the structures lending itself only in a limited sense to such a purpose. The first to attract attention is a plant of that fine acquisition, Louise. The plant, like many others of this variety, was not distributed until late; but it carries four blooms, and of quality equal to any we have noticed outside an exhibition. Chas. Blick also is capital, and quite equal to exhibition form, but most growers have failed to get much size into it, and we do not remember seeing it in any first-prize stand this season; it is a magnificent golden-yellow, and when grown well is a gem. W. G. Drover, Sunflower, Boule d'Or, and G. C. Schwabe deserve special remark, all of them being good, but especially a bloom of G. C. Schwabe—large, full, of good colour, and excellent form. Some good blooms of Niveum further demonstrate the acquisition we have in this superb white Japanese, and Richard Dean is giving a better account of itself than usual.

Colonel Chase is a lovely Japanese variety, its pale rose centre and graceful florets make it very distinct and desirable. Violetta, a violet-rose flower, and Waban, may be mentioned, the latter very good, and by no means ragged as sometimes. When one sees that very distinct, but not entirely satisfactory variety, Good Gracious, it almost forces one to exclain its singular name. Here it is as good as we have seen it, and its delicate colour, and extraordinary distinctness of florets, lead one to hope that it will be more tractable than it has proved this season.

No mention has yet been made of the incurved varieties, but it is by no means that they do not suggest remark, for there are blooms here much better than many that were shown at the Aquarium, and a representative collection withal. Did our pages combine the quality of extensibility with their other elements, it might be interesting to use notes we made concerning these, but we must refrain, and merely give the following names as representing those that provoked the use of the pencil: Jeanne de Arc, Princess of Wales, Queen of England, Empress of India, Lord Alcester, Emily Dale Improved, Lord Wolseley, Nil Desperandum, Mr. Bunn, Jardin des Plantes, and Alfred Lyne.

Solna, Roehampton.

The collection of Chrysanthemums under the care of Mr. Knowles, gardener to the Hon. Mrs. Egerton, is worthy of remark, presenting, as it does, one of those curious, perplexing phenomena in a gardener's very varied experience. The plants are left almost alone during the summer, for beyond watering, they receive little attention and, as a consequence, the stems are weak, the foliage is small and poor, and judged from the ordinary standpoint, promise but poor flowers when taken into the houses. Here, however, is the surprise, for Mr. Knowles has now a very creditable lot of incurved blooms, and Japanese, Anemone, and other flowers of considerable merit.

Pointing to some of the large, well-developed incurved blooms (judged by the standard of those seen this season), a third observer remarked that the wood showed no signs of a ripened maturity, but was quite green—and such was the case yet in many instances these shoots were perfecting incurved blooms rather above than under the quality of the best of those shown at the Aquarium. How is this finishing process achieved without the usual preparation, viz., well-ripened, thoroughly matured plants? Mr. Knowles says it lies entirely in the bud. "Select the proper bud, and it matters not if the shoot is green as grass." Though it would be unsafe to follow such a practice as is hinted here, it may be interesting to record the circumstance.

(To be continued.)

A TRAVELLERS' NOTES.

(Continued from p. 533.)

Napier, New Zealand, *June* 16, 1893.—The excellent, almost circular, harbour of Wellington is surrounded by low hills, forming a basin within which high winds circulate in a most unpleasantly continuous fashion. Sweeping in through the narrow strait connecting it with the open ocean, the strong breezes from the Pacific revolve and revolve apparently in endless gusts. Up the sides of the hills and gullies spreads the town, most of the houses of wood, from Government House and the public offices downwards. English Gorse is now flowering freely, and evidently escaped from cultivation, judging from the large patches beyond the confines of the settlement. The most commonly planted tree is Cupressus macrocarpa, plants of which are offered, I noticed, in a grocer's window at 5*s.* per 100.

On leaving Wellington for the North I directed my course for Napier, a small town on Hawke's Bay, connected by rail, and distant some 200 miles. Hearing, however, that by taking another route, and traversing the bush for 26 miles by coach, some good scenery would be met with, I determined on this course. As far as Eketahuna the train, at the rate of from 15 to 20 miles per hour, traverses hilly country, and some fine forests of Fagus. According to Mr. Kirk, those species commonly represented are F. Solanderi, fusca, and Menziesii. *Apropos* of the genus, the same gentleman writes in the *Forest Flora*:—"The Beech forests of New Zealand may be renewed at a minimum cost whenever it is desirable. Whenever trees are felled, or a track is cut through the forest, myriads of seedlings spring up, the majority of which are gradually killed off in the struggle for existence, leaving the strongest to form trees. No other forests in the colony could be made to afford a regular crop of timber at fixed periods at so small a cost." That the preservation of timber may be found necessary at no very distant date seems probable, and is the opinion of many. The number of fine trees cut, left to rot, and subsequently burnt, is indeed startling to a stranger.

The scenery is very fine, though the rainy mist obscured much of it, and snow lay about, the result of a 4-inch fall some hours previously. Beyond one long narrow gorge, following the turns of the line is a long break-wind, to prevent the hurricane blasts sweeping a train off the rails, an incident said once to have occurred—quite possible with the small narrow-gauge cars in use.

Arundo conspicua and Cordyline australis were common. In its young state the latter is bold and handsome, but when it attains the proportions of a tree, the size of the leaf crown diminishes, and so much cannot be said for it. From Eketahuna to Woodville, viâ Pahiatua, the mail-coach is the best means of transit. In summer it must be most enjoyable, in winter the traveller becomes doubtful as to the possession of his extremities.

Some of the bush, what little is left, is certainly fine, consisting of tall, white Pine (Podocarpus dacrydioides), graceful Rimu (Dacrydium cupressinum), hundreds of Cyatheas, the most common being C. dealbata; Lomaria procera, with fronds 4 to 5 feet long, trailing over banks yards high. The White Pine (Podocarpus dacrydioides) is a striking tree, attaining a height in this district of 130 feet, with a straight often unbranched trunk for 70 to 80 feet. Its timber, though valuable, is not considered so durable, and for that reason is not so highly appreciated as that of some others.

Rimu (Dacrydium cupressinum), "occupies a larger area of the New Zealand forests than any other timber-tree. . . . . it is the chief timber employed for building purposes over fully two-thirds of the colony."* Its pale green foliage and weeping habit render it very handsome, though in size it by no means approaches the White Pine, with which it so freely grows. Various species of the parasitic genus Astelia are common in the branches of both, many bearing thick clumps may be easily discerned.

Clearings are common along the road, the following method being practised. The trees are felled, allowed to rot, then collected together and burnt. In the meantime, grass (English Rye and Cocksfoot, to a large extent), has been sown, sheep and cattle being turned in amongst the decaying logs. The waste of timber is startling; suggest this, and the inevitable reply is, "What are we to do with it?" Thousands of magnificent logs, rotting, lay along the sides of the road we traversed; the why and wherefore naturally being—sheep pay, and timber of the two trees named does not—at least, in such overwhelming quantities. The soil is good, and a plot thus cleared, after the logs have rotted and been burnt, yields a pasture as fine as can be met with. Ring-barking, universal in Australia, is unknown in this district, and, I am given to understand, throughout the colony.

From Woodville by train to Napier; open country, fine pasture and sheep—endless sheep—meet the eye everywhere. Clumps of seeding Phormium tenax, acres of impenetrable sword-like foliage, and many fine clumps of Arundo conspicua, inhabit the swampy ground along the line. Tall bush forest is almost entirely absent. Broad shallow streams—so indicative of low hilly countries—are occasionally traversed, the stream occupying but a small portion of the whole bed.

Napier is a small town on a high peninsula, a square mile in extent. The town lies on a series of rounded slopes in the intervening plain. Though a commercial centre, it has few factories of any consequence within its immediate limits. The weather during the whole season, as in New South Wales, has been, and is now, abnormally wet. It rains daily, and frosts, hitherto almost unknown, have several times occurred. Added to this, a biting wind, the charms of coach-travelling in winter in New Zealand need no advertising. *James H. Veitch.*

BERLIN.

BERLIN LETTER.

At the beginning of September I wrote to you that we had even then Hyacinths in blue and red varieties. Shortly afterwards they disappeared, but the Lilies of the Valley have been continuously in bloom since that time. The flowers are still good, but the leaves become more and more yellowish. Now, in the first days of November, we have also the White Roman Hyacinth. I have seldom seen the flower-stalks of this sort as strong and healthy, so full flowered, and the flowers so well-formed and robust as they are this year. If I did not know the sort well, I should think it was quite another sort. Lilac is now to be had in white forced sorts. The kind which is sold here during the greater part of the year, is the violet-coloured variety. The quantities sold of this daily in the streets are enormous, it is a matter of surprise where they all come from. Beside these Roses are most appreciated. We have them still in good home-grown specimens, but the first frost will certainly bring us the Riviera flowers. Tuberoses are also much liked, and are used in various ways. White, rose-coloured, and scarlet Pinks, especially the latter, are highly esteemed. Camellias in different sorts are in good flower. Orchids, some years ago seldom seen, are now sold in each of the better class flower-shops; Lycaste and Cypripedium are now the most common, besides them I have seen also good specimens of Vanda. That Chrysanthemums are not wanting at this time is not to be wondered at; rose and yellowish-brown coloured sorts of about 3 to 4 inches in diameter are preferred.

It is very interesting to note that plants are now appearing again in greater quantities and variety, not all common species. A few years ago plants were so seldom bought, that you would find in the flower-shops only the most common ones. Some time ago I wrote you that we had had a Cactus show. But other plants are also much liked, so are filmy Ferns. It is not rare to see now good collections of these fine plants. Also there are to be had good collections of Palms. Amongst flowering plants, various Ericas are fashionable plants. Perhaps we shall again have, in a few years, good collections of plants of the Cape and of Australia, once so much cultivated here. This growing interest for plants is to be seen also in another way. Next spring we shall have a local plant show; but whilst for a long time only nurserymen were exhibitors, next spring there will be also some classes for amateurs. The cause of this change in the public taste is to be attributed to the fact that the dark curtains which formerly darkened our rooms, are disappearing. Besides this, almost all the newer houses are built with balconies, which are decorated with plants. At first only the common plants for decorative purposes were bought, but now other species are asked for. It will be interesting to see how gardeners will take this change. The hard competition has made our nurserymen specialists, so that often in a nursery, no more than two or three or even only one species is grown. What will they do if there are asked for more species? Shall we have again the old-fashioned nurseries in which the most varied collections were found? Or shall we have also in future times only specialists? But, be it as may, at all events we have progress in gardening, and this is the best of all. *Our Berlin Correspondent.*

Gardeners' Education in Berlin.

For a long time we have had in Berlin, during the winter months, courses of lectures for young gardeners. At first there were only a few subjects, viz., gardening, botany, culture of plants, drawing, and the art of surveying. The pupils had to pay, as far as I remember, two shillings, and could select which course they liked best. Drawing only was taught in the forenoon hours of Sunday. The other subjects were taught in the evening hours from seven to nine, once or twice a week. The course began in October, and finished at the end of February or beginning of March. The costs were defrayed by the entrance-money of the pupils, and by the then two Berlin horticultural societies. Afterwards there was formed a school with a more comprehensive plan. The town of Berlin has a great many schools of two kinds, viz., those in which everyone may learn whatever he will, the so-called "Fortbildungsschulen;" and others in which only, or especially, such subjects are taught as concern a distinct branch. These are the so-called "Fachschulen" (professional schools). So we have a Fachschule of the shoemakers, of the chimney-sweepers, of the tailors, of the locksmiths, &c. Such a "Fachschule" (technical school) for the gardeners has also been formed. The town finds the rooms, light, &c., and gives a salary to the teachers, to which the Horticultural Society adds. The pupils have to pay three shillings for the winter. Twice in the week, in the evening, from six to nine, and on Sundays during the forenoon hours lectures are given (on Sundays only drawing lessons are given). During the summer months land surveying is taught practically on Sunday. The lectures begin early in October, and end at the end of February. Up till this year there have been two courses.

At the beginning of the course, each pupil had to write a *curriculum vitæ;* from an examination of which it was determined whether the pupil was to enter on the first or second course. Now, each scholar may hear and learn what he prefers, or thinks to be the best for himself. There is no restriction in any way. Every gardener, be he young or old, can learn what he will. The subjects which are taught are—German grammar and orthography, accounts, trade information, and book-keeping with regard to gardening, plant-culture, fruit and vegetable culture, botany, a knowledge of the different kinds of soil and manures and drawing. The number of pupils is increasing from year to year. Whilst we had the last year some sixty scholars, this year we have already over eighty. Of course, all the subjects are taught in a rudimentary manner that every one may understand them. This is necessary, because the scholars have had the most different degrees of education. Besides apprentices, we have older gardeners, over thirty years of age, as well as those who have only had an education in a village school. The results are generally good. At the end of the course each scholar is examined, and gets a certificate. This professional school is not to be confounded with the horticultural schools which we have at Potsdam, Proskau, Geisenheim, &c. The latter are schools in which gardeners remain for two years, and are instructed daily. The plan of instruction, of course, here, is a much wider one. Besides theory, also a good deal of time is given to practical information. *U. D.*

CAMPANULA SIBIRICA VAR. DIVERGENS.*

The drawing of this plant (fig. 77) was taken in the Royal Gardens, Kew, in the past summer by Mr. John Allen. It represents a form of a biennial species distributed through Siberia, the Levant, the Caucasus, the Danube Provinces, Silesia, Northern Italy, &c. The stems are assurgent, slender, terete, hirtulous; the leaves sessile, lanceolate, serrate; flowers aggregated towards the ends of the branches, spreading or drooping; the calyx is provided with reflexed appendages between the sepals, as shown in the enlarged figure; the corolla is campanulate, of a purplish-blue colour, and about double the length of the calyx. The variety differs from the species in the broader leaves and larger flowers.

* C. sibirica, Linn., sp., 236; var. divergens, *Willd. Enum.*, t. 212; = var. major Boissier, *Flora Orient.*, vol. iii. (1875), p. 901.

TRENTHAM.

A visit made at this season to this magnificent place will satisfy anyone that the gardens are in excellent keeping under the present management. The entrance-lodge which stood at the front of the half has been removed, and a stretch of turf has taken its place, the overgrown shrubs pruned back into moderate size, and the drive made level. The large beds in the front panels of the lower terrace are being replaced by large fountains; the lake is being cleared out, and the sheds, stables, &c., for garden purposes have been pulled down, and substantial new ones built. Mr. Blair is continuing the improvements in the pleasure-grounds, which he began several years ago, by forming grassy glades in place of unsightly shrubs and bare earth, bringing out objects as single specimens on the lawns that were previously half-hidden by other things, and generally affording the idea of breadth that was much needed.

Chrysanthemums have been the conspicuous feature of the garden for some half-a-dozen years past, and this year they number about 3000. These plants are up to the average in quality sure to take a place in the back row on exhibition-stands. The flower is of a delicate pink colour, with broad petals, large and massive, and apparently without any eccentricities as regards cultivation. I: horn (splendid), Mrs. Robinson King, John Lambert, M. Darrier, Robert Petfield, Baron Hirsch, Jeanne d'Arc, M. Bahuant, and Hero of Stoke Newington.

There are several span-roofed houses devoted to the

CALYX.
(Enlarged 3 times.)

Fig. 77.—CAMPANULA SIBIRICA DIVERGENS: FLOWERS BLUE. (SEE P. 596.)

or the present season, and should Mr. Blair be able to spare flowers for competition (which is doubtful, on account of the heavy demand at present for cut blooms), he should be able to give a good account of himself. A new seedling incurved variety has been raised at Trentham, which will be should form a worthy companion to M. Bahuant. Some of the more striking varieties in flower were Madame E. Rey, W. Tricker, Rose Wynne, Harman Payne, Madame Mezard, Richard Dean, Colonel Chase, Primrose League, Thomas Wilkins, Boule d'Or, Avalanche, G. C. Schwabe (very good), Anna Hartscultivation of about 4000 Carnations in pots, which consist of Souvenir de la Malmaison and some of the Marguerite varieties. The latter has the merit of being a continuous bloomer. The whole stock of these Carnations is particularly healthy. Cattleyas are excellently grown, and in large numbers. In the Cattleya-

house standing near the ridge is a row of twelve plants of Cymbidium Lowianum, which are magnificent specimens. They are growing in pots of 15 inches in diameter. The spikes at present showing are 3 to 4 feet in length, and have twenty-four to thirty flower-buds. In one of the pits is a fine batch in full flower of Cypripedium insigne and C. i. var. Maulei. The plants covered a space of only about 18 feet by 4 feet, and in this space there were counted nearly 200 flowers. Large numbers of the beautiful Dendrobium Phalænopsis Schrœderianum were remarked, and the lovely Indian Crocuses—Pleione lagenaria, P. Wallichii, and P. maculata. In the Odontoglossum flower-house is a fine display of Odontoglossum crispum, and the various species of Masdevallia are grown with astonishing vigour in the house devoted to them. In a lean-to house was a number of Primula sinensis coming into flower, a charming effect being produced by forming a ground-work about them with potfuls of Selaginella denticulata. The house in which formerly Bananas grew is now a Fig-house, and a glass-case formerly containing Vines is now planted with Pears and Apples as cordons. *J. Udale.*

Florists' Flowers.

AURICULAS.

These plants, as regards show varieties, are at a rather critical time of the year, the outer leaves continuing to decay, and unless these are promptly removed, the seeds of decay may affect the entire plant, which may die. It is the best practice to examine the plants once a week, to have a certain day on which so to do, and to allow nothing to interfere with this arrangement. Ten minutes may be found sufficient time. The pips of the autumn trusses should be cut off, leaving the stem, which will gradually die down, and may then be pinched off; but if the truss be bodily broken off whilst the stem is in a sappy green state, the remains of the stem become rotten, and carry decay to the centre of the plant. Water should be very sparingly applied after this date, the plants being allowed to become moderately dry at the roots, but not dust-dry, which is very injurious to them. Last year's seedlings are now in various stages of development, many of them being full-sized plants that will flower strongly next year. The plants raised from spring sowings are still small, but the seed vegetated freely, and the seedlings have been pricked out to the number of twelve in 3-inch pots. The pans out of which the seedlings were drawn, will be still kept in cold frames or in the greenhouse, the soil being always maintained in a merely moist state. The seedlings will continue to appear during winter.

The alpine Auriculas do not require so much care, and are well adapted for planting in the borders. I have taken the offsets of these, planting them in a border of fine soil, having a low wall on the south side. Those which I planted in the early days of September, are established. It is rather late now for this kind of work, but they may still be put into boxes that will be kept in frames during the winter, planting them out in the spring. These late offsets, if strong, give small trusses of bloom the first year, and form large plants the second year. Alpine Auriculas may remain on the same spot for twenty years, being allowed to spread on all sides, and by so treating them and affording a slight moulding up with sandy loam and dry cow-manure, they make fine blooming tufts.

Show Tulips

may still be planted on beds of rich soil, in a friable condition; but the planting as a rule is best when begun and finished in October. Success or failure in the cultivation of all these garden flowers, depend in a great measure upon the state of the ground at the time of planting, and in the case of the Tulip it is always advisable to plant in the last week of that month, rather than wait till November—a proverbially wet month. Now that the Tulip is likely to be greatly taken up by amateurs, it is necessary to give the reason for every cultural direction. The idea of fixing a certain date, such as November 9, is absurd, as there is so much difference in the seasons; and there may also be a difference of two weeks one way or the other in the condition of growth in the bulbs themselves, which would also have to be considered. In some years they may not be ready to plant out before the second week of November, whereas in another season planting late in October might be desirable. The right time to plant Tulips is when the base of the bulbs swell a little, a condition that is caused by the growing roots raising the coating of the bulbs, and the latter ought to be in the ground before the roots become visible. The top of the bulb should be at the least 3 inches below the surface, the bottom of the bulb resting on white sand. Tulips should not be planted when the soil is very wet; and if there is no prospect of dry weather, get some fine dry soil to place around the bulbs, always placing sharp sand under them, to prevent the rich soil coming into immediate contact with the bulbs, and perhaps causing decay.

The arrangement of the colours should be attended to; the old system of planting one of each class alternately is the one amateurs should adopt. But for a large trade collection, it is better to begin with the bizarres, and plant the entire collection of these first, following these with the byblœmens, then the roses, and the breeders last. The old florists used no labels, merely beginning at one end of the bed, and planting in rows across it, seven bulbs in a row, the order of planting being written in the Tulip-book, every bulb being named in proper order. *J. Douglas, Great Gearies, Ilford.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

Cœlogyne cristata.—This species and its varieties now fast finishing up their growth, are beginning to push up their flower spikes. When in growth, Cœlogynes need considerable quantities of water at the root, but at the present season the plants should be kept rather drier, the young spikes being very liable to turn black and rot away if the potting materials are kept in a constantly wet state.

Maturing the growth of Orchids.—Through insufficient sun-heat, some Orchids will be found in most collections with pseudobulbs which are only partly developed, and these plants should receive a more generous treatment, or their flowering will be either unsatisfactory or they will not flower. This applies in particular to Schomburgkia tibicinis, S. undulata, S. Lyonsii, and S. Sanderiana. It is generally admitted that these plants are very difficult to flower in a regular manner; and to ensure success, everything that will assist growth should be done by the cultivator, this being of more account than any amount of drying off afterwards. Speaking generally, these plants succeed under the same kind of treatment as is found to suit the Mexican Lælias. At Burford, owing to certain circumstances, the plants have been put into one of the hottest houses, well raised up to the roof, where they can obtain every ray of light possible. This greater degree of heat will have the effect of assisting the early formation of growth, and be favourable, perhaps, to the production of flower-spikes, but it cannot fully compensate for the deficiency of sunheat. Schomburgkia crispa is not nearly so refractory a plant in getting to flower as those last-named. A strong plant is standing in the Cattleya-house, has flower-spikes already 2 feet in length, and it has received the same treatment as the Cattleyas. Lycaste Skinneri and varieties are late in finishing their growth, and the plants have been taken from the Odontoglossum-house and placed in a light position at the coolest part of the Cattleya-house. They still require plenty of water at the root, but when the flowers commence to push up from the base of the new bulbs, the plants will be kept on the dry side for a few days, which will enable the flowers to come up altogether, instead of by ones and twos at a time. In high temperatures Lycaste foliage is liable to become infested with a very minute acarus or red-spider, which feeds on the lower side of the leaves. These insects should be destroyed as soon as observed, by sponging them with the usual insecticides. The increase of artificial heat at this season favours the propagation of the ordinary species of red-spider on the leaves of other Orchids, especially those which are thin and grass-like, as Cymbidium, Maxillaria tenuifolia, M. angustissima, Platyclinis filiformis, also Cœlogynes, Sobralias, &c. Whether red-spider be present or not, it is good practice to wash the leaves rather than run a risk of these enemies multiplying unmolested. Such Oncidiums as O. crispum, O. Forbesii, and O. varicosum grow fairly well during the summer and early autumn months in the cool house, but now that their flower-spikes are visible, the temperature of the intermediate-house will be more suited to their needs. These last-named species are sometimes seen to be slowly deteriorating, and one of the chief causes of this is giving them too much heat, weakening them by permitting the flowers to remain on the plants for a long time, or by their being more numerous than the plant can bear. As a rule for general observation, strong flower-spikes should not remain on the plants for any great length of time after all the blooms are fully open; and small weak plants should have their flower-spikes removed so soon as they show. After flowering, return these plants to their former quarters; but do not keep them long without water, drought being injurious to them at any season.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

Gooseberry sawfly caterpillar.—When the pruning of the Gooseberry bushes is finished, means should be taken to destroy the chrysalids of the sawfly, which, if the bushes were infested last spring, are lying just beneath the surface of the soil under the bushes. It is good practice to loosen the earth with a digging-fork round about the stems, shovelling it away and forming it into a ridge midway between the rows, to be deeply dug-in at a later date. The earth being removed, it may be replaced with some from the alleys, previous to which, by way of further precaution, a good handful of air-slaked lime and fresh soot should be thrown on the soil under the bushes. Gooseberry bushes planted in rows at a distance 6 feet apart admits of this mode of removing and replacing the soil being carried out, but where the bushes are more thickly planted together, it is absolutely necessary to bring clean soil from a distant part of the kitchen-garden, removing that taken from beneath the bushes to some quarter where it can be trenched in. Hellebore powder applied over the bushes, either dry or in water, as soon as the first brood is hatched, will clear the bushes, and the fruit being very small then, there is no danger of poisoning by it.

American blight.—All the Apple-trees being now cleared of their leaves, the gardener should go over the trees infested with American blight, dressing them with petroleum emulsion. This may be made with any kind of oil, as sperm, neats-foot, olive, linseed, &c., and is a very efficient dressing. It is made by mixing equal parts of petroleum and oil, and with a painter's brush dressing all the infested parts of the branches and stem, first removing the rougher parts of the bark. Petroleum by itself so surely penetrates the bark, that even when trees are dormant it is a very unsafe substance to use alone, but when mixed with oil it is quite safe to use. Whilst the dressing of young trees is a simple matter, with larger old trees it is a big job, and except in cases where the trees cannot well be spared, I would advise that all large, or virtually worn-out trees which may be badly infested, be grubbed up and burned forthwith.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

Sowing Peas.—In southern counties and warm districts generally, the old fashion of sowing a few rows of early podding Peas may now be followed. Where these conditions of climate do not exist it is better to sow in pots or troughs in the spring, and grow on under glass, ready for planting out when the weather has become suitable. If sown at this season the soil should have been well manured, and carefully dug, and when the drills are drawn, dry soil such as potting-bench refuse should be placed under and over the seeds, a dusting of soot following when the drill is half filled in, the soot tending to avert the attentions of the mice. Much watchfulness is needed to protect them when above ground from their various enemies, the chief of which is the sparrow.

Horn Carrots in frames.—A mild hot bed consisting of three-fourths tree leaves and one-fourth

stable-dung or half-spent hotbed manure, may now be made, a frame placed thereon filled with light soil to within 6 or 8 inches of the glass. When the soil is sufficiently warm, seed of Horn Carrots should be sown in lines; like hotbeds generally, if not made in a pit dug in the ground, it will require a lining round the box, and in hard weather another all round it may become necessary to keep up the right degree of heat, say from 65° to 70° with about 75° to 80° bottom-heat. Before the soil is put into the box, some short manure should first be put in to a depth depending on that of the box, and the soil should not be less than 7 in. thick. If the plants come up very thickly, thin them without delay, as they soon spoil if crowded together. The last-sown Carrots out-of-doors, upon the approach of frost, must be protected by scattering tree leaves amongst them, and they will then continue to grow, except in very inclement weather.

THE ICE HOUSE.—Whilst there is time for such work it is a matter of prudence to put the ice house in readiness for being filled; and to repair all the tools used in dragging the ice ashore and smashing it up in the house.

BROAD BEANS.—These plants, although much hardier than Peas, and more generally sown in the late autumn than those, should have a sheltered position chosen for them. The Early Mazagan is a trusty variety for autumn sowing, or rather dibbling. If some of this variety be sown at the foot of a south wall, clear of the drip from the coping, the produce will come into use sooner than that of plants growing in the border.

CELERY.—As growth will not continue much longer, it will be advisable on the first dry day to finish the earthing-up of late Celery, severe frosts soon crippling the tender heart-leaves, and thus setting up decay. In some cases the main crop will now have grown above the banking-up so much, that it will be necessary to add more soil from the trenches, one man holding the tops together, whilst the other puts the mould round the stalks. In the event of frost, protect with dry litter, bracken, &c.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

ROSE CUTTINGS.—Where Roses are raised from cuttings, the latter should be made and inserted in a bed suitably prepared for them. A border on the east or west sides of the kitchen garden, sheltered by the walls, should be chosen as the site of the cutting-bed. If stiff, some sand and leaf-mould may be dug into it, and if naturally light and porous, it will suffice to dig it deeply, make it level, tread it evenly all over, and chop out furrows with an almost perpendicular side 1 foot apart, and set the cuttings against that side at about 6 inches apart. If possible, the cuttings should be all strong, straight, of one length, and made of well-matured shoots, with a heel of ¼ inch in length of the previous year's growth attached. The cuttings may be 9 to 10 inches in length, and they should be prepared like those of the Gooseberry, leaving from three to four buds on that part that is above the soil, the rest being rubbed off. Whether planted in furrows or dibbled in, the base of each cutting should be made firm in the soil. In severe winters protection in the way of bracken, branches of evergreen, or any other light material may be placed over them.

BEDS AND BORDERS OF ROSES.—These should be inspected, and all the dead and unhealthy plants removed, and a list of varieties made for filling up gaps thus made. If alterations are contemplated, the ground should be prepared so that on the arrival of the plants from the nursery they may at once be planted. It is good practice to remove a good deal of the exhausted soil, exchanging it for new pasture loam; and to this crushed bones and rotten manure may be added, incorporating them well together. Where Roses are raised at home, planting may be done at any time between the beginning of October and the middle of the present month. In planting the Rose, trim the roots a little, spread them out on a conical mound firmly made at the bottom of the hole, placing them but a little deeper than they were before, filling-in the hole by degrees, and treading all firmly as the soil is thrown in.

HERBACEOUS BORDER.—Now that the flowering of most of the occupants of this border is over, the stems of tall or straggling growers, such as Pyrethrum serotinum and other species, Helianthus, Heleniums, Phlox, Lupins, &c., should be cut down. Where it is not an eyesore, the plants are greatly benefited by being top-dressed with rotten manure at this season, having first carefully cleared off all weeds and rubbish. Note should be made of any species or varieties in flower at this season, so that, if necessary, they may be increased. Some of the Lupines, as well as Delphiniums and Aconites, may be divided at the present time, and almost any small portion of the above, if removed with a root or two attached, will, with fair treatment, form good plants next season.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

FIGS IN POTS.—As soon as the leaves have fallen, the repotting of those which require it should be taken in hand; and before potting the plants, those which may be infested with white or brown scale or mealy-bug, should be cleaned. White scale, the worst Fig pest, is difficult to get rid of in one season, as the insecticides can only be applied during the season of rest. The old wood should be well brushed with some soap-suds in which a small portion of petroleum and carbolic soap are mixed, and several times painted with Lemon-oil emulsion, applying it with a painter's brush. If the plants are infested with mealy-bug, the house walls, floors, and pots must be thoroughly cleaned in the same manner as that advised for a Vinery, and the same kind of insecticide used as for the other pest. There is nothing gained by growing Figs in over-large pots, as good-sized plants will fruit satisfactorily for many years in sizes say 12 to 18 inches in diameter. Plants which are to be repotted should be soaked in a tub of water, having first turned them out of the pots and removed all crocks. When saturated, let the water drain away, and when dry enough to be handled conveniently, loosen the matted roots with a pointed stick, but do not shake them out. Use pots that are either new, or quite clean old ones, that are large enough to give the roots 2 inches of fresh soil all round, and afford ample drainage materials. The potting-soil may consist of strong, turfy loam, and a small quantity of ½-inch bones, no other kind of manure being employed. The soil should be in a friable condition, neither very wet nor dry, as they require to be potted very firmly, and the rammer used. Young layers or rooted cuttings which may have filled with roots the 8-inch pots in which they have grown, should be shifted into 12-inch pots, it not being a desirable practice to keep them for any length of time cramped in small pots, plants better furnished with branches being produced if they are moved on quickly when young. After cleaning and re-potting the plants, any required pruning should be attended to; but if previous directions in regard to summer pinching and the regulating of the future bearing-shoots have been attended to, very little will now require to be done. Much training is also not needed, a pyramid or bush requiring merely a strong stake placed in the middle of the ball, and the side-shoots regulated by fastening them to shorter stakes or pegs put in near the rim of the pot; and this is only necessary whilst the trees are young. One point in Fig culture which is sometimes lost sight of in pot plants, and planted-out Figs, is the amount of space which should be afforded each shoot, so that it may obtain the necessary light and air to perfect the development of the fruits. A Fig tree in a good state of health will continue to bear fruit in one stage or another for a long period of time, and it is ruinous to allow useless wood to crowd the head. Plants not requiring repotting should be lifted out of the plunging material, the drainage put in good order, and be top-dressed with loam after removing the exhausted upper crust, ample space being left for affording water. In replunging the plants, allow as much space as possible for each tree, and it is better to keep the plants of one size together, the small ones being placed at the front, near the glass, and the larger ones in the centre of the house. Excellent varieties of Figs are Violette Sepor, Grosse Verte, St. John's, Negro Largo, Early Prolific, Pingo de Mel, and Black Bourjassotte, although the good old varieties should not be lost sight of. Cuttings, for striking in heat next spring, may now be taken—short pieces with a heel, laying them in damp soil in a sheltered place till required. They strike very freely. Good plants are easily obtained by layering shoots in 6-inch pots during the summer.

TREES PLANTED OUT IN BORDERS, if growing too gross, should be carefully lifted, the roots pruned, and replanted, planting them very firmly, and not allowing more space for the roots of each than about 8 feet square, brick divisions being built between them, so that separate treatment may be afforded, if needed. If the soil be wet or clayey, an impervious bottom should be used in the border, and thorough drainage. The border may consist of good loam 2 feet thick, with plenty of lime and brick-rubbish mixed with it. The training and top-dressing should be proceeded with as for pot-trees, and but little water afforded at the root during the winter, although dryness should be avoided, or the first crop may drop; abundance of air should be given during mild weather, but frosts should be excluded from the house.

VINES FOR EARLY FRUITING IN POTS.—These may now be started, following generally the directions given for Vines in borders, and giving a thorough root-watering at the commencement, but employing but little fire-heat for a few weeks.

STRAWBERRIES IN POTS should now be plunged in frames or in coal-ashes in the frame-yard, covering them with litter in the event of hard frost. The first batch may be placed in a cool house ready for starting.

PLANTS UNDER GLASS.

By J. F. MCLEOD, *Gardener, Dover House, Roehampton, S.W.*

TUBEROUS-ROOTED BEGONIAS.—When it is seen that the tubers are ripe, they may, if space be of consequence, be turned out of their pots, and laid down thinly on a bench or shelf, in a dry house that is well ventilated, but which can be heated if wet or frosty weather should occur, frequently turning them over till most of the soil has fallen from off the tuber. When this occurs, lay them in shallow boxes in a mixture of Cocoa-nut fibre refuse and sand, and store away in a place to which frost has no access.

GLOXINIAS.—Those which are out of bloom should be treated similarly to the foregoing, except that they should be kept in a place having a temperature during the winter of 40° to 45°.

THE FERN HOUSE.—Most species of Adiantum should be frequently examined for decayed fronds, removing these by cutting them off at the surface of the soil. Liquid manure should now be withheld from nearly all Ferns; those of the arboreal section may still be afforded weak doses at longish intervals of time.

SEASONABLE OPERATIONS.—Where it is intended to plant out at a later stage, any of the various plants which are adapted to this mode of culture, the present time, whilst the contents of the various houses are being overhauled, is a good one for preparing the borders and beds. The drainage of the same should be of a thorough kind, or the growth of the plants will be unsatisfactory. The drains may consist of field drain-pipes, laid with a sharp fall to the out-fall drain, and brick-bats may be laid over these to the depth of 1 foot, and over this some rough peat-sods, packed closely together to prevent the soil from filtering into the drainage. Warmhouse plants, such as Stephanotis floribunda, Allamanda, Bougainvillea glabra, Dipladenia, Clerodendron, and many others, will require a free-rooting compost of two parts fibrous peat, one part of fibrous loam, while the remaining part may consist of one-fourth part of old mortar, charcoal, sand, and half-inch bones; this mixture should be thrown into the beds and borders prepared for the plants, and be moderately pressed together. A similar preparation, save that loam and peat should be added in equal parts, will be found suitable for such greenhouse-climbers as Clematis indivisa, Lapageria, Plumbago, Jasminum, &c. If the compost be dry, water should be afforded on one or more occasions, to moisten it throughout.

ANTHURIUMS OF THE SCHERZERIANUM SECTION, now growing in quarters where the necessary amount of artificial heat cannot be obtained, when frosty weather ensues, should be removed to warmer pits or houses, where they will be suitably placed at the cooler end. The leaves will require to be sponged over with soft-soap and warm-water, handling the leaves very tenderly, to avoid splitting them. Water in more moderate quantity may now be applied at the roots, but the syringing of the leaves must still be persisted in, using soft-water by preference.

FORCING HOUSE.—Roman Hyacinths will now be showing their flower-spikes, and when the first flowers expand be removed to cooler quarters. The stems will need some slight support of a sightly kind. Continue to place plants and bulbs in this house to maintain a succession of bloom.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY,	Nov. 20	Woking and District Horticultural and Cottage Gardeners' Association Show of Chrysanthemums (two days). Manchester Royal Botanic Society's Chrysanthemum Show (two days).
WEDNESDAY,	Nov. 21	Glasgow Chrysanthemum (three days).
THURSDAY,	Nov. 22	Rotherham and District Chrysanthemum.
FRIDAY,	Nov. 23—Dundee Chrysanthemum.	

SALES.

MONDAY,	Nov. 19	Great Sale of Nursery Stock, at Mason's Nurseries, Windlesham, Bagshot, by Protheroe & Morris (six days). Dutch Bulbs, at Protheroe & Morris' Rooms. Plants, Spiræas, and Hardy Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 20	Sale of Orchids at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 21	Great Sale of Palm Seeds at Protheroe & Morris' Rooms.
THURSDAY,	Nov. 22	Dutch Bulbs at Protheroe & Morris' Rooms, also Plants and Roses.
FRIDAY,	Nov. 23	Orchids at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.
SATURDAY,	Nov. 24	Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.5.

M. Duchartre.

WE regret to have to announce the sudden death, in his 84th year, of one of the most distinguished of French botanists, M. P. DUCHARTRE. Among horticulturists, he will be best known from his long connection with the National Horticultural Society of France, and as Editor of its Journal. Scientific men will remember the whilom President of the Institute (Académie des Sciences); botanists in particular will treasure the memory of an indefatigable worker, who maintained the best traditions of the splendid French school of morphology. There is, however, hardly a department of botany in which M. DUCHARTRE has not left his mark. In systematic botany his monographs on Aristolochiaceæ and Liliaceæ are noteworthy; in physiological botany, his work was voluminous, and characterised by ingenious experimental research and careful observation; in teratology, DUCHARTRE'S records were very numerous. As a teacher at the Faculté des Sciences, the late Professor was long and honourably distinguished, and to outsiders he is known specially by his *Éléments de Botanique*, a text-book as remarkable for its wide grasp as for the lucidity and clearness of its exposition. In the Horticultural Society of France, DUCHARTRE occupied for many years a position analogous to that held with such advantage to our own Society by Mr. BERKELEY. In this country, while there are many who will hold his memory in respect as a distinguished botanist, there are also some who will likewise entertain for the deceased master a lively feeling of gratitude.

Chrysanthemums.

THE Chrysanthemum season, with its ever-increasing list of shows, will soon be over for the present year, the majority of the southern exhibitions having been held, and those in the more northern districts and north of the Tweed follow shortly.

It is quite impossible for us to give detailed reports of all these exhibitions, and our space has therefore been given to the more important of them, including a comprehensive account of the exhibition of the National Society at Westminster.

Regarding that display, a few remarks may not be out of place. The show was another large success, clearly showing that the society still retains in a very full measure the confidence of the exhibitors and cultivators. The Japanese varieties as usual made the brighter display, and generated the greater enthusiasm and the closest competition. To say that they were shown well, would be to inadequately describe the wonderful quality of the blooms. There is little doubt that Japanese flowers have never been shown better at any exhibition than the collection which secured the 1st prize in the open competition for thirty-six distinct varieties. Many of the varieties were new, and were larger naturally than the older ones, at the same time the cultivation could hardly have been better.

Incurved blooms, on the other hand, were not equal to those that used to be familiar to us, nor have they been really good for several seasons past. If present indications go for anything, it will appear that these blooms are grown in fewer numbers than ever, due chiefly to the overwhelming attractions of the Japanese varieties, which appear to absorb in large measure the attention of the cultivator, and this becomes more easy from the fact that they are less difficult to cultivate. The incurved flowers of the Japanese section, however, are popular with raisers and growers alike, and numerous varieties of great attractiveness are brought out each year.

If closely-incurved flowers are voted too stiff and uninteresting, there can be no such objection taken to the larger and less close flowers of the Japanese incurved section, such as the excellent Louise, sent out this season; Lord Brooke, Préfet Roberts, and many others, and it would be well if the Society were to include special classes for flowers of this type in their schedule for next season. They would be certain of more popularity than the strictly incurved blooms now enjoy, and perhaps fewer or none might then be included in the stands of Japanese. As we have said, these Japanese incurved are presented for certificates in numbers; they are large, showy, and many of them easily grown, consequently they figure much too largely in the Japanese stands. In any first-class stand the proportion of pure Japanese flowers is lower than it should be, and perhaps if the incurved and the reflexed were made the subjects of separate classes, the departure would be a good one.

The Anemone-flowered and the Pompon varieties have been exhibited in average numbers. The Anemone section is augmented by several new and excellent varieties, such as John Bunyan, Queen Elizabeth, and Descartes. These two sections are not unpopular, and in many cases where they figure less prominently in collections than they ought, it is by reason of the rage that exists for display and effect, and all this is more easily attained by cultivating Japanese varieties. Single flowered varieties make but little headway, though one seldom hears it denied that they are pretty and useful.

In all the sections, but principally in that of the Japanese, new varieties continue to be sent out in large numbers, and at present the reputation that France has long enjoyed in this respect remains practically unimpaired, but many good things have come from other parts of the continent, and from America; nor must we omit to notice that more has been done in raising English seedlings than formerly. Still, much more might be done at home.

The gain that has resulted from all this cross-fertilisation is evident in the improved habit of the plants, and the size and colours of the flowers. Varieties that grow only 3 feet or 4 feet high, and produce first-class blooms, are becoming more common, and again may be instanced the above-mentioned Louise, or Avalanche, a little older variety, but representing clearly a better habit than any of the whites previously raised.

The value of the Chrysanthemum for decorative purposes was never better illustrated than at the show of the National Society, where additional classes brought exceedingly tasteful ingenious arrangements; and the exhibition was so far more attractive. Much might still be done in the same direction, and it is worth consideration whether the whole of the show blooms could not be exhibited in a more artistic manner, and yet in such an one that the qualities of the bloom could be judged as readily as at present.

Speaking of Chrysanthemums for decoration, it may be added that several additions have been made to this useful class. Conspicuous amongst such is Ryecroft Glory, raised by Mr. JONES of Lewisham, an excellent acquisition in this class; then there is Mrs. R. Filkins, the new one shown by Messrs. CANNELL & SONS, Swanley, before the Royal Horticultural Society, on Tuesday last, an exceeding pretty one for such purpose.

In regard to the best varieties in either section, it would not be difficult to make an analysis of the varieties exhibited in the best stands this season. Every grower strives to obtain the largest and best flowers, and did we forget this, it would be surprising that certain varieties should be exhibited with such frequency, and that competitors should exhibit such uniformity in those they select to stage. We cannot go into that question now, however, but in passing we might urge judges and exhibitors alike to give a little more consideration to refinement in a bloom, and rather less to mere bulk.

The present season has not been an unusually good one for growers of Chrysanthemums, neither was 1893; indeed, compared with last year, we are not disposed to speak of this season unfavourably. In 1893, the amount of dry hot weather was too great, the plants were more than ripened, they were hardened in an unsatisfactory degree, and, subsequently, incurved varieties especially opened unkindly. Some varieties were excellent, and precisely the same kinds have been comparative failures this season, owing to the very reverse of circumstances that attended their growth. The growers' ideal year, we are afraid, is an improbable one, when all the varieties may be seen at their best.

Without attempting to include cultural details at this time, we think it may be well to add the following hints, rather to remind the cultivator than instruct him. Do not take your cuttings too early, or from plants you have dosed incessantly with manures of divers descriptions. Select small cuttings in preference to long ones; they root more easily, and are freer. Do not grow more plants than you have labour and convenience to cultivate perfectly, and in a season like the present you will be better prepared to prevent loss from damping. In stopping the plants, and especially in taking or selecting the bud, be guided by the character and circumstances of the season. Any cultivator is aware of the importance of some of the hints just mentioned, but they are just those that bear frequent repetition, because they are not always practised by those who know their importance best.

In conclusion, reference must be made to the interesting and eminently practical paper read by Mr. C. E. SHEA on Tuesday last before the Royal Horticultural Society. The simple direc-

Fernery in the Garden of L. Marquard, Esq., Cape Town.

tions then given on how to raise Chrysanthemums from seed ripened in this country, by a gentleman peculiarly fitted by personal experience in the work, should result in many more cultivators engaging in the work. A summary of this lecture is given on p. 606.

FERNERY IN THE GARDEN OF L. MARQUARD, ESQ., CAPE TOWN.—Our supplementary illustration shows a charming example of the decoration of the walls and roof of a fernery, with Ferns of diverse species, Begonias of the ornamental-leaved type, Pothos or Philodendrons, Ficus stipulata, and other plants of a scandent clinging habit. Being out of the usual run of such constructions, as regards its informal arrangement, and sufficiently favourable to the growth of the plants employed, it forms a pleasant addition to the conservatory from which it appears to be entered. The electric lamps indicate that it does not remain unvisited at night.

AN EXHIBITION OF NARCISSUS, PANSIES, AND VIOLAS IN BIRMINGHAM.—The third annual exhibition of these flowers is to take place in the Birmingham Botanical Gardens on April 9 and 10, and the schedule contains fifteen classes, with five prizes in each class. A very extensive exhibition of Pansies and Violas is arranged to be held in these gardens on May 29 and 30, when between £40 and £50 in cash and the large handsome silver medals of the Botanical Society will be given in prizes, including those for twelve true species of Viola in pots, as well as for six double or single Violets in pots. Other exhibitions are contemplated, and the annual great exhibition of the Midland Counties Carnation and Picotee Society will be held in August.

BIRMINGHAM BOTANICAL GARDENS.—We learn that Professor HILLHOUSE, the Professor of Botany at Mason College, and Honorary Secretary of the Botanical Gardens Committee, is taking very active interest in these smaller representative exhibitions, and in the gardens generally; and a large tract of ground, formerly used for the exhibition, under an enormous tent, is now being converted into an alpine rockery garden, designed and planted by Messrs. JAMES BACKHOUSE & SON, of York.

KNIPHOFIA NELSONI.—Mr. GUMBLETON tells us he has flowered this new species, described in our columns in 1892, and reports that the colour is very brilliant, and must be seen on a living specimen to be properly appreciated—a dictum every one will assent to.

"THE BOOK-HUNTER IN LONDON."—Mr. W. ROBERTS, editor of *The Bookworm*, is preparing under the above title a fully-illustrated book. It will form a companion to M. OCTAVE UZANNE'S *Physiologie des Quais de Paris*, better known under the title of the English translation of *The Book-Hunter in Paris*. The results of many years' inveterate book-hunting will be chronicled, and the experiences not only of the compiler, but of many past and present distinguished "hunters" will be laid under contribution. The introductory chapter will take the form of an essay on "The Theory and Practice of Book-hunting." This will be followed by a dissertation on book-hunting in London from the earliest times to the eighteenth century. Other chapters will deal with book auctions and auctioneers; with some famous collections and collectors; with book thieves; with book-stalling in London, with famous booksellers; with lady book-collectors; with the prices paid for particular books in past and present times, booksellers' catalogues, and other interesting matters connected with the subject. The compiler, therefore, will gladly welcome any information or suggestion sent without delay to him, as well as the loan or indication of rare or curious pictorial illustrations of the subject, at 86, Grosvenor Road, London, S.W.

HORTICULTURE AT THE LORD MAYOR'S SHOW.—Very pretty, says the *Times*, was a car contributed by the Gardeners' Company in honour of their science and craft. In the main it took the form of a huge basket of flowers, with Flora holding a wreath, a gardener at work, and a nymph scattering artificial flowers. Contrary to custom, women were dispensed with on this occasion, the first and third figures being in wood or papier-maché. It is a pity that they could not have been prevented from wobbling about in a decidedly undignified fashion.

STOCK-TAKING: OCTOBER.—Brightening up nearly all round is the opinion of our commercial prospects based on the Trade and Navigation returns for the past month of October. The imports for the month show an increase of £311 088 over those for the same period in 1893, and an increase of £7,777,048 is recorded for the ten months of the present as compared with the same period in last year. Annexed is the usual extract from the "summary" table of import values for the month, not forgetting that decrease in value does not always mean decrease of quantities:—

IMPORTS.	1893.	1894.	Difference.
	£.	£.	£.
Total value of imports	35,357,297	35,668,385	+311,088
(A.) Articles of food and drink—duty free	13,293,187	12,261,764	—1,031,423
(B.) Articles of food and drink, dutiable	2,802,939	3,005,375	+202,436
Raw materials for textile manufactures	3,347,040	3,958,526	+811,486
Raw materials for sundry industries and manufactures	4,459,104	4,536,262	+77,158
(A.) Miscellaneous articles	1,429,950	1,431,685	+1,735
(B.)—Parcel Post ...	37,180	92,317	+55,137

Our caution as to values and quantities receives corroboration very often in the matter of exports where—as in the case of the decrease recorded for the ten expired months—cheapening of prices to suit markets is the cause of what looks like a falling off.

We come now to our usual brief record of the import trade in fruits, roots, and vegetables for October, as follows:—

IMPORTS.	1893.	1894.	Difference.
Fruit, raw:—			
Apples ... ... bush.	642,279	1,229,146	+586,837
Cherries ... ... ,,	...	...	...
Plums ... ... ,,	12,362	34,701	+22,339
Pears ... ... ,,	107,715	204,377	+96,662
Grapes ... ... ,,	380,616	405,701	+25,085
Unenumerated ... ,,	71,076	115,950	+44,874
Onions ... ... ,,	595,469	611,764	+16,295
Potatos ... ... cwt.	43,218	39,389	—3,829
Vegetables, raw, unenumerated ... ... value	£ 60,164	£ 77,138	£ +16,974

These figures have always a peculiar interest when coupled with those in the first table relating to imports of cattle and cereals—the comfort of the toiling millions is greatly affected by them; the agriculturist may use them in determining his future course of action. Noticing a slight increase in the value of timber of all sorts imported, we are reminded of the truth of the old saying about "ill winds," &c. Mr. Commissioner CAMERON, in his last annual report (published recently), on the condition of the Turk and Caicos Islands, states quite naïvely, that there had been but a trifling import of lumber during the twelvemonths, owing to the fact that a great quantity of wreckage had been thrown up on the shores of the islands! These remarks bring us to the matter of—

EXPORTS.

For the past month these show a total of £19,147,996, as against £18,179,792 for the same period last year, or a gain of £968,204. There is something substantial about this rise; of course, the reader takes into account the general aspect of affairs, the death of the Czar, and the so-called war between China and Japan. We have made a good treaty with Japan, which country, in five years, will be thrown open to us just as ours is to the indomitable Jap, and he will introduce new and favourable features into the tariff, under which we hope to win much. We note that champagne growers and woollen manufacturers in France are breaking away from Protection, and ranging themselves under the Free Trade banner. In Spain, also, the dry bones are sounding, and whilst we take stock, our American cousins are busy electing members for the next House of Representatives and the Senate. Both sides count to win the majority, by means of increased tariff facilities—one side hampered by free silver coinage; this latter has a most depressing effect on American trade, and will continue to do so until dismissed from consideration; then there will be a "boom."

TAXODIUM DISTICHUM AT LAEKEN.—Among the large number of trees of the Taxodium distichum which are to be seen around the lakes at Laeken (Brussels) is one of unusual size, 3 mètres 40 centimètres in circumference, and 30 mètres in height. This tree is a very handsome Conifer, and at this season is remarkable for its yellow-coloured leaves, which are striking in the distance. This month is the best time to plant it; it does best in low-lying land near the margins of lakes.

THE RUSSIAN THISTLE.—A recent *Bulletin* of the United States Department of Agriculture contains an account by Mr. LYSTER H. DEWEY of the Russian Thistle, a plant which, though covered with spines, is no Thistle, but the species known to botanists as Salsola kali var. tragus. It is believed to have been first developed on the plains of south-east Russia, whence it was probably accidentally imported into America with Flax or other seed. In its new home Salsola has already so increased as to have caused damage to the value of several million dollars, thus constituting a serious evil, to check which the Department of Agriculture is instituting organised investigations to determine the exact cause and extent of the new weed, and the best means of preventing its increase. It is found that certain districts of Dakota, Minnesota, Iowa, and Nebraska are thoroughly infected with the plant, which thus prevails over an almost continuous area of 35,000 miles, which has been covered with it in the comparatively short period of twenty years. This wide distribution is due to the dispersal of plants and of their seed by the wind, by the seed of it becoming accidentally mixed with Wheat and other grain, and by the fact of the bushes being blown on or into railway stock, and thus transported for long distances. Plants broken off at the roots by the wind are frequently blown about all the winter, their fruits meanwhile retaining their fertility, and germinating in the spring. The "Tumbleweed," as it is sometimes called, ruins the crops of grain and Flax, clogs machinery, and by its many and sharp spines inflicts serious injuries on both men and horses. As to the best means of coping with it there are, according to the Report before us, two principles to be acted upon:—1. No Russian Thistle should be allowed to produce seed. 2. There must be concerted action throughout all the infested area. As regards the first condition, it is reckoned that three years of united effort on the part of the farmers would probably completely eradicate the pest. Wheat should be sown and grown early, so as to have the start of the Salsola, and after harvest the stubble should be mown, left to dry for a few days, and then burnt or ploughed in. Crops such as corn (Maize), Potatos, and Beet should be sown late, and the plants of Tumbleweed hoed up before seeding. Also roadsides and wastelands should be weeded, weed-laws enforced, fences and trees arranged to keep the Thistle from rolling, and care taken that Flax and other seed is, when sown, as pure as possible. In fact, to quote the concluding words of the *Bulletin*:—"The chief hope, therefore, of subduing the Russian Thistle lies not in legislating it out of existence, but in an earnest effort by each community and each individual, after seeing the advantage of destroying

it, and the danger of permitting it to grow, and after learning with what ease and certainty it can be eradicated, to carry out these measures. As the law may have some effect in the case of non-resident landowners and wilfully ignorant or careless farmers, it should be enforced against them with all the healthy sentiment of the industrious farmers at the back of it."

PINUS BUNGEANA.—Mr. MILBURN of the Royal Victoria Park, Bath, sends us a branch with cone of this interesting species, a native of Northern China, and one which has the merit of being hardy and ornamental. The cone now received is considerably larger than that previously figured.

"THE NATURAL HISTORY OF PLANTS."—The seventh part of the English translation of this valuable treatise is before us. The author, as has been previously stated, is Professor KERNER VON MARILAUN, of Vienna, and the translation has been made under the superintendence of Professor F. OLIVER. A natural history of plants has, till recently, been too much confined to an account of the systematic relationship of plants, an account of the natural orders, and so forth. The present volume is more physiological in character. The minute structure and organisation, together with the outward conformation, are treated from a physiological rather than from a genealogical point of view. In the present part the subjects treated of are climbing plants. The old trouble of "dextrorse or counter-clockwise," and "sinistrorse or clockwise," of course confronts us, but we cannot say that the authors have laid down any more precise definition than others have done, and it is quite conceivable that with the description and picture here given, some readers will attach precisely the opposite signification to that intended by the author; and, moreover, that they will be justified in so doing. In treating of the stem, attention is directed to the provisions in the trunk and branches for resisting strain, pressure, and bending—provisions, of course, of a mechanical nature dependent on the formation and disposition of thickened cells. The flower-stem and inflorescence come next under review, and then the root and its marvellous attributes. It is satisfactory to find the author cautioning the reader against that very common tendency to confound a statement of fact with the explanation of that fact, as in the case of such words as "gravitation, geotropism, negative, and positive," and other similar terms. The particular instance cited by our author, is "stimulus." What is a stimulus? In the present state of our knowledge, no concise answer to this question can be given.

TESTIMONIAL TO MR. WILLIAM DEAN, BIRMINGHAM.—MR. ROBERT SYDENHAM and MR. W. B. LATHAM met MR. DEAN on the evening of Wednesday, November 7, and formally presented him, in the name of the Committee of Subscribers, with a handsome Silver Watch bearing the following inscription:—"Presented to Mr. WM. DEAN, along with fifty guineas, on his 70th birthday, as a mark of esteem. Subscribed for by florists and friends in all parts of the country."

BOOK NOTICE.

THE FORESTER. Sixth edition. By Brown & Nisbet. (W. Blackwood & Sons.)

The appearance of what may not inaptly be termed the continental edition of Brown's *Forester*, at last supplies the British student with a reliable text-book on practical forestry. The editor must be congratulated upon the success which has attended his attempt "to engraft (in literature, at any rate), the modern continental science of sylviculture upon the old British stock of arboriculture." That in order to do this, he found it necessary to practically re-write the whole book, is in itself sufficient evidence that the work before us is something more than a "revised edition," and the fact that in so doing, German forest literature has been largely laid under contribution throughout, is a guarantee that the information supplied is the best of its kind and up to date. The opening chapter is partly historical, and also deals with the position forestry holds in rural and national economy, particular attention being directed to its present and prospective condition in Great Britain. Frequent extracts from the evidence laid before the Select Committee of 1887 appear, and the greater part of the chapter is practically an argument in favour of the teaching and practice of scientific forestry. Chapters ii. and iii. deal with the botanical description, habitat, methods of propagation, and sylvicultural peculiarities of all hardy broad-leaved and coniferous trees respectively. The editor's additions to these chapters in the shape of a concise summary of the results of all-important observations and investigations made by continental experts, are of especial value. The characteristic features by which the timber of the more important trees may be identified, might advantageously have been added for the use of the student. In dealing with the disputed question of mixed *versus* pure woods, the editor (p. 518, vol. i.) differs slightly from the author, but neither sufficiently emphasises the evils frequently occasioned by an indiscriminate mixture of species, independent of light requirements, rate of growth, period of maturity, &c., to which much of the bad condition of English woods is attributable. Chapter vi. devoted to soil-preparation, drainage, &c., contains certain conclusions (p. 529) regarding the former subject which deserve special attention from practical foresters, as the expenses of planting may be needlessly increased by too much zeal and too little knowledge, both regarding this and draining work. The editor's comments (Chapter vii.) upon the comparative advantages of natural regeneration, sowing, and planting, and the methods of rearing plants, are likely to be critically received by practical foresters and others interested in these matters, although they are undoubtedly justifiable from an economic standpoint. Several excellent continental methods of planting are described which deserve to be more generally adopted in this country, but we find no mention made of the German forest-plough, an implement especially useful when small-sized plants are used on grassy land. The editor's opinions regarding the density of plantation crops at planting-time are (p. 583) evidently opposed to the British practice of thin planting; yet Gayer, whom he quotes in support of his views, lays down rules on the subject, which are practically identical (size of plant considered) with the prevailing custom in this country, viz., 3 to 4 feet between the plants. In a following paragraph we read, "Larch or Scots Pine cannot thrive if planted so close as shade-bearing species." This statement neither recognises the survival of the fittest, nor is it reconcileable with the German practice of raising Scots Pine forest from seed. Chapters ix. and x. are both full of valuable information. The editor's comments and quotations on thinning are copious and instructive, but something more definite on the *rationale* of this work is desirable. We think, too, that the important part which natural selection plays in the production of first-class timber, and the practical deductions to be drawn therefrom, deserve closer attention. Neither do we find sufficient stress laid upon the necessity for regulating thinning operations in such a manner as to obviate the sudden removal of trees whose crowns form part of the normal leaf canopy. This point has constantly to be dealt with in practice. The chapter devoted to the utilisation of forest produce contains some instructive illustrations of implements, methods of felling and transporting timber, &c. Useful data regarding the qualities and physical properties of timber are also given. Forest pathology is briefly but comprehensively dealt with. The statement (p. 320, vol. ii.) that the Elm-bark beetle prefers young and vigorous stems to dead or sickly trees, is scarcely confirmed by observations made in this or other countries. Hartig's conclusion regarding the use of seed from diseased trees (p. 308), does not admit of too broad an interpretation, if the first principle of sexual reproduction that like begets like be admitted. Indirectly, the use of seed from thoroughly sound individuals is of great importance, although it may have no purely pathological significance. The data collected from yield tables (Chap. xiii.) may be of interest to the student, but many years of systematic management must elapse before they can be applied to British woods, except, perhaps, in the Scots Pine districts of the north. The continental methods of measuring standing timber might be advantageously practised in this country, but the conservative principles of the timber merchant and valuer render their more practical application a difficult matter. The following chapter on working plans is also in advance of present-day forestry in Britain. We agree, however, with the editor in thinking that more systematic methods of working our woods are urgently needed, and until something in this direction takes place, no great improvement is likely to be effected in British forestry. An appendix dealing with the forests of various countries throughout the world, brings the second volume to a conclusion. To recommend this work to the notice of landowner, forester, and student would be superfluous. That the publication of this or any other work on scientific forestry is likely to have any marked effect upon British wood-management, however, is extremely doubtful, so far, at least, as private estates are concerned; but that does not affect the intrinsic value of the works themselves, and the dissemination of scientific knowledge can never do any harm.

HOME CORRESPONDENCE.

FRUIT *v.* FICTION.—Your correspondent, Mr. B. Wells, writes in a very straightforward and practical style, and I would reply likewise. To his question, whether I have grown fruit "for a living," I answer, that for years I tried to do so; but the result would soon have been dying unless I had betaken myself to something else. With regard to the Grape-growers of the Channel Islands, I have received from several sources the very opposite account to that of Mr. Wells, and for the greater part of the season Channel-island Grapes have been sold in Covent Garden at 6*d.* to 1*s.* per lb. Mr. Wells speaks as if the fruit-crop were as certain as the foliage of the trees. But every grower must reckon with at least one scanty year in three. Neither must he reason from the produce of one happy tree to that of several thousands. Perhaps the bushel measure at Crawley is not of the capacity needful here; else it would appear impossible that a Pear tree planted in 1885, which we are almost left to infer, should produce 25 bushels of fruit in 1893. My most productive and largest tree (of thirty-five years' growth) affords me a maximum of 15 bushels, and that with an interval of two or three years. Taking the average, one may not count upon half a bushel per tree all round; and a Pear tree must be of some years' growth before it will yield so much as that, without breaking its constitution. But the most amazing statement is that 6*d.* per bushel is a paying price for Apples or Pears. Mr. B. Wells must indeed have men as tall as Pear trees, and more nimble than Peas, if they can gather and pack the fruit at less than 3*d.* per bushel; horses, moreover (of iron, or flesh), very different from ours, if he can send his countless bushels to market for less than the other 3*d.* apiece; leaving *nil* to pay for land, years of waiting, interest on capital, labour, and manure, and the rich diversity of outgoings, as numerous, and far more sure than Pears. Of Gooseberry-growing I have no experience; but have heard, on the one hand, tales about it worthy of the great Münchausen, and have known, on the other hand, many a year when scarce a Gooseberry survived for "fool," or for the "silly season." But of Pears, I have as large an experience as any man in England; and I say that, taking one year with another, and allowing for growth and replacement of trees, weather and wind, blight, maggots, and boys, lucky is the man who can send to market 200 bushels per acre. I have 10 acres of Pear trees, and have never yet marketed 2000 bushels in one year, though the trees are strong and in their prime; that is to say, at Mr. Wells' paying price, £5 per acre would be the gross return, to cover all outgoings. Why, rent alone, in this part of the world, would swallow Pear and paring. But my chief object in writing to you is to assure Mr. Chas. Pearson that I make no general charge against the great and important branch of art which he pursues. It is not to be supposed that all nurserymen, any more than any other race, exclaim beyond conscience

or conviction, "Great is Diana of the Ephesians!" or even "there is nothing like leather." Many of them have annually more orders than they can execute, which alas! is not our fate, and the few who do blow up the golden trumpet of fruit-growing may believe that the gold is pure, because they have never tested it. I am well aware that Mr. Frank Rivers sends much fruit to London, and that the great reputation of the firm secures unusual prices. But what said his excellent father to me, when, after a delightful visit to Sawbridgeworth in the ancient days, I exclaimed, "Why, you don't seem to grow fruit very largely here." "The fact of it is," he replied, with his pleasant and very intelligent smile, "it pays much better to grow the tree than it does to grow the fruit." If so then, what shall we say now? Moreover, I would remind Mr. Pearson of a little tale I had the privilege of unfolding to him or his brother. Failing of Pear trees in England one year, I had a large bundle from a nursery in France. While they were being unpacked, an enlightened English nurseryman came in. He admired their growth, sleek olive stems, ruddy and golden ripeness of twig, &c., and asked the price. "Half a franc each," I replied; "could you send them out at that figure, Mr. ——?" "God forbid!" was his pious response. And I fear (in spite of Mr. Pearson's patriotic faith) that the Lord who enables the Frenchman to grow the tree at a quarter of the English price has enabled him to do the like with the product of that tree. *R. D. Blackmore.* P.S. In my last note, p. 541, there are some misprints—fad or too should be fact or two, degradatis should be degradation, Marillet should be Marillat. *R. D. B.*

CHRYSANTHEMUMS AND GRAPES AT TAPTON HOUSE, CHESTERFIELD.—In the garden at the above place are just over a hundred plants of Chrysanthemums standing in a low lean-to Peach-house. The flowers are as yet not fully developed, nor are they grown for exhibition purposes, although they would stand a fine chance of winning a first place, except for new varieties. Any lover of the Chrysanthemum would, I think, be struck with the beautiful blooms and fine healthy foliage, their shortness of stature, and the large quantity of bloom on each. None of the plants range higher than 3½ feet, and many are but 2½ feet, and all of them carry from six to eight blooms apiece. One bloom of Viviand Morel measured over the top of the flower to the tips of the outer petals, 21¾ inches. This is the second year I have known Mr. Grimes, the gardener, to grow Chrysanthemums. The most remarkable varieties grown are Viviand Morel, Florence Davis, Stanstead Surprise, Etoile de Lyon, W. Holmes, W. Tricker. Madame Louise Rey, Condor, Gloire du Rocher, W. H. Lincoln, and Mr. F. Jameson. In a vinery erected by the late George Stephenson, the eminent engineer, at this place, there is an old Vine of the Black Barbarossa, 14 feet long, and this one rod has carried twelve bunches of fruit this season, three of which have been cut off. Those which remain will weigh from 5 lb. to 8 lb. each, with splendid berries, and good in colour. If these bunches were exhibited, some who viewed them would be inclined to the belief that quantity had been sacrificed for quality, but as a fact, the two are combined. *R. W. P., Derbyshire.*

CHRYSANTHEMUM FLORENCE CARR. — Any addition to the Pompon class is always welcomed, as new varieties possessing the necessary merit to take their place and remain in this section are seldom forthcoming. The above variety, which I noticed last season at the Royal Aquarium and the Crystal Palace, received a First-class Certificate, and I thought a promising flower, favouring in shape Mdlle. Elise Dordan, but the colour is a deep bronzy-red with yellow-tipped petals. The plant, if I may judge by those I have seen this season, is dwarf in habit, and the foliage is well retained. *Pom. Grower.*

CEDAR CONES.—In looking this morning (November 7), at some Cedars of Lebanon and also Cedrus atlantica, I find there are numerous male cones on the same branch as the seed-bearing cones are produced. The nearest male cones are perhaps about 1 foot from the female cones. It may interest Canon Ellacombe (p. 541) to know that the catkins are not produced in such abundance on those branches as on those that have no female cones. Some trees of Cedrus Libani have at the present time myriads of male catkins, all thickly set, and numbering, perhaps, tens of thousands, giving the tree a striking appearance. The oldest specimen here of Cedrus Deodara has this year, for the first time, produced six or seven female cones, but not a single male catkin is to be seen on it; but some years it has produced plenty. Other and younger trees of deodar have at the present time plenty of male catkins. *A. Harding, Orton, Peterborough.*

WHITE MARTAGON DEGENERATING.—With this note I send specimens by way of illustration. At various times in the last fifteen years friends in Ireland have sent me fine bulbs of White Martagon. These always flowered well for a year or two, often producing as many as fifty flowers on a spike, after that they rapidly degenerated, and at the end of four or five years were reduced to lumps of minute bulbs, each perfect as far as it goes; packed together in the form of the original bulb, from the scales of which they have grown. Nothing I can try, and I am not deficient in the resources of gardening, will either prevent the old bulbs from assuming this habit, or nurse the baby bulbs into flowering size. Possibly, in the Irish climate and soil they might grow up to maturity, but the climate and soil of England seems unsuited to them. Other Martagons, including dalmaticum, flourish here very well, and last for many years. I have tried the white in every kind of soil. *C. Wolley Dod, Edge Hall, Malpas.*

CRINUM MOOREI.—Considering what a great demand there is for white flowers in a cut state, it is surprising that this noble Crinum is not more generally found in gardens. The pure white blossoms, if cut as soon as they are fully expanded, will last fresh for quite a week in water. Our two plants have this year pushed up two scapes of bloom each, but not at the same time! Is not this unusual? The first had eleven flowers upwards of 8 inches in diameter, four being open at one time. The same plants produced a second scape with eight flowers, not quite so fine as those on the first one. The colour of C. Moorei is sometimes described as pink, or a soft rose-pink, but ours are white. *J. Easter, Nostell Priory Gardens.*

ARAUCARIA IMBRICATA.—I have here at present about four dozen seedlings of the Chili Pine, Araucaria imbricata, raised from seed ripened on a tree in the gardens here last autumn. On the same tree there are this year a quantity of young female cones which will, of course, not come to maturity before next autumn. Close by there is another tree, which every year bears a quantity of male-catkins only. Do any of your readers know of any other instance in the north, east, or west of Scotland where the Araucaria has produced ripe fertile seed? So far as I am aware, there are very few places in the south of Scotland where ripe seed has been got. *A. G., Inverness.* [Will some Scottish reader kindly give his experience? Ed.]

MARKET PRICES.—Mr. Ilott mentions in his note concerning market prices that he had sold Runner Beans at 1*s.* per bushel. Thinking that such a price was rather below ordinary market returns, I asked one of our metropolitan growers who sends during the season over 100 bushels weekly to market, what his returns were, and he replied. "Rarely indeed under 2*s.* 6*d.* per bushel." Now this is but another illustration of the difference that exists between the professional and the amateur salesman. It is just what is seen in the case of fruit, and it does but help to show that there is an art in selling as in growing, which the amateur element fails to recognise. Mr. Ilott doubtless belongs to the army of amateur salesmen, although a good gardener, and it is this army of private growers and some amateurs who have done so much to bring down prices, and make a living for the professional market-grower so difficult. No doubt the commoner element benefits by the consequent great abundance in the market, but at least all those who help to that end should realise that each one is an agent in lowering returns, and should therefore be the last to complain. The grower of many acres, and of huge responsibilities, never rushes into print to ventilate his grievances, and even under adverse conditions which the introduction of thousands of private gardeners and amateur competitors have created, he not only lives but manages to thrive. To-day the vegetable markets are glutted with Brussels Sprouts, because the growing weather renders them so wonderfully plentiful. It is an incident that has to be borne with because there is no help for it, but all the same there will not be a single Brussels plant the less produced next year. *A. D.*

THE BLACK CURRANT-MITE.—For the first time in my life I learn that it is a crime, or little less, not to have seen or personally known the Currant-bud mite; yet it is quite true, until this day I have never met personally with market grower or gardener who has ever made reference to it, or to any trouble arising from it. The exception this day was in Middlesex. When looking over a big breadth of several thousands of young bushes, I asked whether there were evidences of the mite amongst them, and the reply was, "No; they are perfectly clean." The only place where the mite gave trouble was in an old breadth some twenty years planted, where trees overhung, and the soil was indifferently cleaned and cultivated, That is, I am disposed to think, ordinary experience. Given good culture in all phases of tree or bush life, insect pests give little trouble. Gooseberry-caterpillar, Apple-maggot, woolly aphis, and other insect pests are always most troublesome where culture is bad. I have told audiences constantly that keeping trees and bushes in good health by cleanliness, thinning, good culture, and feeding, does more to repress insects and other pests than so-called remedies. I stick to my guns. *A. D.*

SIZE OF EXHIBITION STANDS.—At page 573 of the *Gardeners' Chronicle*, Mr. W. Wells writes about his Chrysanthemums being disqualified, and seeks to make a grievance of it. He quotes regulation 8 of the Kent County Schedule as follows:—Regulation 8 says: "Exhibitors are requested to have their stands made in accordance with the metropolitan plan, &c." What does this mean! Surely the schedule is plain enough. After "Metropolitan plan," it reads, "the stands for twelve blooms to be 24 inches long and 18 inches wide (with holes 6 inches apart from centre to centre), &c.," with full instructions as to height. The stands Mr. Wells used were, as far as I can remember, 3 inches longer and 3 inches wider; he therefore clearly infringed regulation 8. At the bottom of the page of regulations, Mr. Wells will find these words: "N.B.—These regulations will be strictly adhered to, and any infringement will disqualify exhibitors." Mr. Wells says the judges at Blackheath refused to disqualify, this is also an error. I was one of the judges, and I informed certain members of the committee who were present, that the judges had no alternative but to disqualify. The schedule may require altering another season to meet the requirements of such growers as Mr. Wells, that is another matter, and does not apply to the present case. *J. Douglas, Ilford.*

NURSERY NOTES.

MESSRS. J. CHEAL & SONS, CRAWLEY.

At no season can anyone interested in the fruit crop derive a greater amount of pleasure from a visit to these nurseries than in the last days of August. During several years past this firm has been increasing in reputation for fruit-tree culture, and the ground now under fruit cultivation is greater than ever. At the recent show at the Crystal Palace, excellent examples of fruit were staged from these nurseries; the Pears in the large collection were equal to the Kentish-grown fruit, being well-developed and weighty. The Pears at the Crystal Palace when contrasted with the fruit upon the trees at Crawley at the end of August show the remarkable gain in size during September. This fact had been previously pointed out to me when in conversation with a Jersey grower who attached the utmost importance to the practice of allowing the fruit to hang as long as possible. To return to the nursery trees, the hardy appearance of the growth was remarked as surprising after such a wet season as we experienced. The trees bore the sturdy look about them which promised well for the ultimate success when planted. The Apple crop was not so plentiful a one as usual, but in some instances there was an abundance, and the trees had to be supported. The variety that was especially prominent for colour, size, and crop, was Duchess of Oldenburg, which evidently for heavy land is a profitable kind to grow. For the market in its season it is one of the very best. Others which struck one as unusually good were Betty Geeson, Annie Elizabeth, Professor (an early cooking

variety of much promise), Cospatric (which as cordons was heavily cropped), Golden Spire (very fine), Ecklinville, Prince Albert (extra good crop), Schoolmaster, Bismarck, for which the firm have a large foreign demand, is one of the very finest, the trees are strong, and the fruit large and good; Pott's Seedling, Worcester Pearmain, Northern Dumpling, and Lord Derby, were promising well; The Queen (well suited to heavy land), Lord Grosvenor, Lady Sudeley, and Frogmore Early Prolific, are all thought highly of at Crawley, each kind being heavily cropped Peasgood's was then of large size, the fruits upon the small trees very fine; Landsberger Reinette (strongly recommended, being a certain cropper); Colonel Vaughan and Jolly Miller were remarkable for high colour; Lord Grosvenor, at Crawley, was found to do well on the free stock, and Frogmore Prolific on the Paradise. Some double cordons of Keswick, which had survived the ordeal of selection a year or two back, were wreathed in fruit. The Dartmouth Crab was very striking, the heavy crops of highly-coloured fruit being most effective; planted amongst shrubs, this would tell well in the autumn.

Of Pears, a selection is grown under glass as cordons; the best of these were Pitmaston Duchess, Beurré Hardy, Princess, Belle de Bruxelles (a showy early kind), Bon Vicar (heavy cropper), Beurré Superfin (excellent), Jersey Gratioli, Doyenné Boussoch, Louise Bonne, and General Todtleben. In nearly each instance these same varieties were correspondingly good outside, Pitmaston having a russetty appearance; Doyenné Boussoch, with very rich colouring. Triomphe de Vienne, a Pear that is rapidly gaining ground, was of excellent quality; Beurré Fonqueray, Fertility, Marie Benoist, Souvenir du Congrès, Beacon, and Beurré Bosc, were all noticeable. As a novelty in shape and colour, Mikado, a Japanese Pear, is worthy of notice.

Turning our attention to Plums, the most striking, by reason of their cropping qualities, were Belle de Louvain, Archduke, Cox's Emperor, Victoria, and Diamond; several of these and other sorts were cropping well as cordons. The quarters of fruit trees was pointed out as containing some 70,000 stocks worked this season.

Under glass, both Vines and Figs in pots are grown; for the latter there is evidently a greater demand than formerly. The situation of the nursery is flat, and the effect of strong winds are felt, but to guard against injury, tall, but thin hedges of Hornbeam have been reared—some of which are fully 12 feet in height.

Of shrubs and trees for landscape gardening, there are large quantities. Mr. Joseph Cheal, who attends more particularly to the landscape business, evidently believes in rearing his own stock. Summer-houses are dotted about here and there, and for these there is a large demand. They are made on the premises, and these are in a locality of excellent choice as regards suitable woods. *Vitis.*

New Invention.

THE TELESCOPE-CUP AND TUBE.

In fig. 78 is represented yet another cup and tube in which to stage Chrysanthemums and other flowers for exhibition. The length of the tube in this case is regulated by means of the brass screws, and when fully elongated the cup is elevated 9 inches above the show board. The centre tube is the water container, and the stem of the flower is passed from the cup into same through a rubber washer. The holder is intended to be fastened to the stand by means of three small screws, where it would be a fixture, and when closed for travelling, the cup remains about 2 inches above the board. Our readers will best know which of the several inventions will suit their purpose most perfectly. The telescope-cup and tube has been patented by Mr. W. E. Tidy, Brockhampton Nurseries, Havant, Hants.

SOCIETIES.

ROYAL HORTICULTURAL.

November 13.—At the meeting of the Society on Tuesday last in the Drill Hall, James Street, Westminster, Orchids and Chrysanthemums were exhibited largely, and the meeting generally was a good one.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. C. T. Druery, H. Herbst, J. H. Fitt, J. Fraser, R. Owen, Geo. Stevens, C. F. Bause, J. D. Pawle, C. E. Pearson, H. Turner, G. Gordon, H. H. D'Ombrain, E. Mawley, H. Cannell, H. B. May, W. C. Hackett, C. E. Shea, and P. Barr.

A large group of Cyclamen was staged by the St. George's Nursery Co., Hanwell, London, W. The plants were all young ones, and carried a fair quantity of flowers for so early a date (Silver Flora Medal). Another group was from Messrs. H. Low & Co., Bush Hill Park, Enfield, in which case the plants were larger and older (Silver Banksian Medal). From A. Kingsmill, Esq., Harrow Weald, came some sprays of Pernettya mucronata, in variety, and very handsomely berried.

A miscellaneous group, composed of well-grown specimens of stove and greenhouse plants, was staged by Mr. J. F. McLeod, gr. to J. P. Morgan, Esq., Dover House, Roehampton, London, S.W.; the Crotons, Dracænas, &c., made a very bright effect, and the group was further relieved by Cypripediums, Bouvardias, and Cyclamens (a Silver-gilt Flora Medal was awarded).

Messrs. H. Cannell & Sons, Swanley, Kent, made a wonderfully bright show with zonal Pelargoniums, Chrysanthemums, &c. The Pelargoniums represented some capital varieties, of extremely large size and bright colours. Etna is one of the best of the purple-scarlet varieties. R. Dean is quite purple. Pink Domino, Sucrée, Maud of Wales, and Ethel Lewis are good pinks. Salmons, O. W. Holmes, Œnone, Mrs. Hall, A. F. Wootten; whites include Albion and White Lady; whilst Parker's Favourite, Jno. Ruskin, Bright Eye with a pretty white eye, and W. P. Wright, are among the best of the scarlets. M. Jules Chretien with white centre and scarlet edge is pretty; and Raspail Improved, and the curious double New Life were exhibited. The Chrysanthemum blooms represented novelties, most of which are described in another column. Mrs. R. Filkins, a pretty yellow Japanese with forked florets, received an Award of Merit; it will be very popular among the decorative varieties. A similar award was given to Alice Seward, a rose-purple Japanese bloom (Silver-gilt Banksian Medal).

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, exhibited a group of exceptionally pretty little plants of Begonia Jno. Heal, with small rose-coloured flowers.

Mr. Robt. Owen, Maidenhead, exhibited a stand of first-class Chrysanthemum blooms, including many good novelties. Awards of Merit were obtained by the following: John Lightfoot, a large full, reflexed Japanese of pale lilac-rose, J. Bidencope, a large Japanese of rosy-purple, with silver reverse; and Owen's Perfection, a Japanese Anemone-bloom, with white ray-florets, and lilac-coloured cushion; Mrs. Seebohm, white; M. Vilmorin, yellow; Pride of Maidenhead, a creamy-white, with good florets, all Japanese, and others, were good.

A large collection of cut blooms of Chrysanthemums was staged by C. E. Shea, Esq., The Elms, Foots Cray, Kent. Maggie Blenkiron, a very fine incurved Japanese of bronze and yellow; Sir Edward T. Smith, a small yellow Japanese, of fine form; and Miss Rita Schroeter, a large Japanese bloom of white and pale rose, were each recommended an Award of Merit. There were many other superb varieties in this collection, and in all about sixty blooms (Silver Flora Medal).

A collection of single-flowered varieties was staged by Mr. George Jones, gr. to Mrs. Jones, Queenford Place, Sudbury, and were a pleasing contrast to the larger flowers.

Mr. W. J. Godfrey, Exmouth Nurseries, Devonshire, in his excellent collection, had the following three varieties, to which Awards of Merit were recommended: Garnet, a Japanese incurved crimson, with silver reverse; Mrs. Dr. Ward (American), a hairy Japanese bloom, colour reddish-buff, with yellow ground; and Mrs. W. J. Godfrey, an excellent white hirsute variety. Many other good flowers were shown. Also blooms of a pink-flesh Carnation, Reginald Godfrey, and a white one, Miss Mary Godfrey, both very good in quality.

From Mr. W. Wells, Earlswood Nurseries, Redhill, came flowers of single varieties, including Purity, a magnificent white flower about 2½ inches across, very pure, and a large yellow eye (Award of Merit).

Plants of James Lynch, a good crimson Japanese, were shown, and blooms of the green sport from Viviand Morel.

Mr. W. Slogrove, gr. to Mrs. Crawford, Gatton, Reigate, exhibited a magnificent collection of cut blooms, about fifty, and all showing exceptional cultivation. Thunberg was wonderful; and some blooms of Thunberg Improved were exhibited, but we could detect very little distinction in this. Lord Brooke was also capital (Silver Banksian Medal).

Mr. W. Seward, Hill Farm Nursery, Hanwell, showed Elthorn Gem, a yellow incurved bloom, Bronze Beauty, a Japanese incurved, and a large rough Japanese named Autumn Morn.

From Her Majesty the Queen, Royal Gardens Windsor (gr., Mr. O. Thomas), was exhibited a sport from the New Hairy Wonder. The blooms of this sport, named Princess Ena, were slightly smaller than the type as shown; the outer petals are rosy-lilac, and the centre of bloom a silvery yellow. It is hirsute as the type, and very pretty in colour (Award of Merit).

A plant in flower of Cosmos bipinnatus grandiflorus, about 5 feet high, bearing a good number of white flowers 2½ inches across, and grown by Mr. S. B. Simpson, Worthing, was recommended an Award of Merit. Messrs. Stroud Bros., 182, Green Lanes, Finsbury Park, N., exhibited plants of Pteris cretica cristata Torrancei, the frond segment being much wider than other forms. It appears strong, tough, and will prove a good thing for market work (Award of Merit).

Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton, exhibited plants of a good narrow-leafed decorative Dracæna named Lord Roberts, some plants of Croton Mayii, also Lastrea atrata variegata, with dull variegation, and a very pretty variety of Pteris Victoriæ named picturata.

The 1st competitive class for Chrysanthemums was for a collection of cut blooms, distinct, to be shown without any dressing, and to stand well above the moss covering the box, supports admissible (Amateurs). The 1st prize was awarded to a collection from Mr. George Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, S.W., which included some very good Japanese blooms, notably W. H. Lincoln, Sunflower, Lord Brooke, Chas. Blick, and others. The incurved blooms were rather weak, Mrs. N. Davis and Lady Dorothy were the best. The 2nd prize was for a good collection from Mr. J. F. McLeod, gr. to J. P. Morgan, Esq., Dover House, Roehampton, S.W., the incurved varieties figuring well here, Golden Empress, Queen of England, Empress of India, Princess of Wales, &c.

The next class was for twelve cut blooms, of not fewer than eight distinct varieties, sent out since 1891 (Amateurs). Mr. McLeod was awarded 1st prize, and there was no other exhibitor. Chas. Blick, Louise, Waban, Col. Chase, Good Gracious, Col. W. B. Smith, Violetta, and niveum, were all good in this stand.

For a group of Pompons and single varieties, either or both distinct, plants not to have been disbudded, the 1st prize was awarded to Mr. Wythes for a nice group. There was no other competitor.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Secretary), De B. Crawshay, E. Hill, C. Pilcher, H. Ballantine, H. M. Pollett, H. J. Chapman, S. Courtauld, W. H. Protheroe, T. B. Haywood, and F. Sander.

The shows at the Drill Hall serve admirably to indicate the species flowering at any given season, by the greater proportion of the plants shown being of those species. At this meeting, the varieties of Cattleya labiata and of Cypripedium insigne predominated, and each contributed some remarkable forms.

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, exhibited a very beautiful new hybrid in Cattleya × Fabia (Dowiana ♂, labiata ♀), which had beautifully-formed flowers, the sepals rosy-lilac, with a light cream-coloured mottling, as in C. aurea marmorata; the handsome lip was dark red, merging into yellow at the base, both colours having a pretty white veining. The front lobe of the lip was bright purple, the margin crisped (Award of Merit). Messrs. Veitch also showed the beautiful Lælio-Cattleya × Statteriana

C. labiata ♂, L. Perrinii ♀), and the richly-coloured Cypripedium × Tityus (œnanthum superbum ♂, spicerianum ♀).

In Messrs. F. Sander & Co.'s group of rare plants was a very remarkable bigeneric hybrid, the first of its class—Epilælia × Hardyana (Lælia anceps ♀, Epidendrum ciliare ♂). This remarkable combination results in a most graceful plant, whose habit of growth partakes most of E. ciliare, in the thin cylindrical pseudobulbs and tall slender flower-spike. The plant shown had two flowers. The sepals and petals, which were lanceolate and nearly equal, were blush-white, with a pale rose flush at the base. The base of the lip also was blush-white, except the tips of the side-lobes, which were purple. The front lobe of the lip is extended on a very distinct isthmus, the blade being ovate, finely crimped, and irregular at the edge, and of a rich violet-purple (Award of Merit). In this same group were some beautiful species of the Pescatorei section of Zygopetalum, which seem to grow and flower very freely in this nursery, viz., Pescatorea Klabochorum, with large white flowers, tipped with vinous-red; P. Lehmannii, with very handsome violet and white flowers; P. Dayana; the pretty and rare Stenia pallida, the delicate rose-tinted Phaio-Calanthe × Arnoldiana, the singular Dendrobium platycaulon, with compressed pseudobulbs and pale yellow flowers (Botanical Certificate); Zygopetalum rostratum, Lælia tenebrosa, Calanthe × Victoria Regina, and C. × Sandhurstiana; Lælia præstans, Catasetum Christyanum, and various forms of Dendrobium Phalænopsis Schroderiana, of which the variety purpurea was the darkest and richest-coloured.

The Right Hon. J. Chamberlain, M.P., Highbury, Moor Green, Birmingham (grower, Mr. H. A. Burberry), sent varieties of Dendrobium Phalænopsis Schroderianum, of great beauty; D. P. highburyense was a fine flower, with a remarkable cherry-red hue over its entire surface (Award of Merit). D. P. Chamberlainianum is very large, and perfect in form, white, suffused with light purple, the dark apex of the lip affording a striking contrast; another handsome form was white, except the tips to the segments, which were lilac-coloured.

F. Wigan, Esq., Clare Lawn, East Sheen (grower, Mr. W. H. Young), staged Cypripedium × Clarence, a hybrid of C. Spicerianum, with the form of C. × Leeanum, and C. × œnanthum upper sepal; also Cattleya superba and Lælio-Cattleya Cawenbergiana.

Messrs. Vervaet & Co., Mont S. Amand, Ghent, showed the wonderfully spotted form of Odontoglossum crispum, Franz Masereel, quite two-thirds of the flower surface being occupied by blood-red blotches of varying size (First-class Certificate).

Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, staged a group composed principally of forms of Catasetum Bungerothii and C. macrocarpum, some of them appearing to be almost intermediate between the two species, and one plant bore a female flower. There were the typical C. Bungerothii, with its large white flowers; C. B. aurantiacum, in which the flowers were of great size and of a light orange hue (Award of Merit). C. O'Brienianum (Award of Merit), probably an intermediate or natural hybrid form, with ivory-white lip and sepals, and petals white blotched with purple as in the handsome C. macrocarpum Lindeni; C. Bungerothii var. Lindeni, also with handsome flowers and rose-mottled petals (Award of Merit), and C. macrocarpum chrysanthum, the clear yellow form, figured in the Lindenia (Botanical Certificate). With them were Cattleya Alexandræ elegans, &c. The group was awarded a Silver Banksian Medal.

W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke (gr., Mr. E. Carr), showed Odontoglossum crispum, Fair Oak variety, a very handsome form, with slightly rose-tinted spotted flowers. Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed the handsome Cypripedium × Edwardii (superbiens × Fairreanum), C. × Roberti (hirsutissimum × insigne Wallacei), a pretty form with some resemblance to C. × Germinyanum; C. × Ariadne, Cattleya aurea and C. a. magnifica, varieties of Cattleya labiata, &c. (Vote of Thanks).

Earl Cowper, Panshanger, Herts (gr., Mr. J. Fitt), showed a group of varieties of Cypripedium insigne. With them were Lælio-Cattleya × Mauve Queen (C. Warnerii × L. crispa), like a small L. C. × exoniensis; and a very fine dark rose hybrid Calanthe (Vote of Thanks).

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed a four-flowered inflorescence of his new white Cattleya labiata, R. I. Measures variety, described in the last issue of the *Gardeners' Chronicle* (Award of Merit); the handsome clear yellow and white Cypripedium insigne Ernesti (Award of Merit), and the rare and pretty Cymbidium cyperifolium (Award of Merit).

E. Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. H. Holbrook), showed a fine plant, with many flowers, of his handsome Cattleya labiata elegans, which had the sepals and petals white, very faintly tinged with lavender-blue, the front of the lip being of a rich shade of purple, with a broad lavender-coloured margin (Award of Merit). From the same exhibitor came Cypripedium × John Ashworth (reticulata × Sedeni candidulum), and C. × Ashworthii, of the Leeanum class. W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), showed cut spikes of a grand dark and a fine light form of Cattleya labiata, and his pretty light variety of Cattleya Gaskelliana.

Norman C. Cookson, Esq, Oakwood, Wylam-on-Tyne (gr., Mr. W. Murray), sent Cypripedium × Cyris (Boxalli atratum × Argus), a very handsome large-flowered hybrid, with rich large dark blotches, as seen in C. Argus Moensii (Award of Merit).

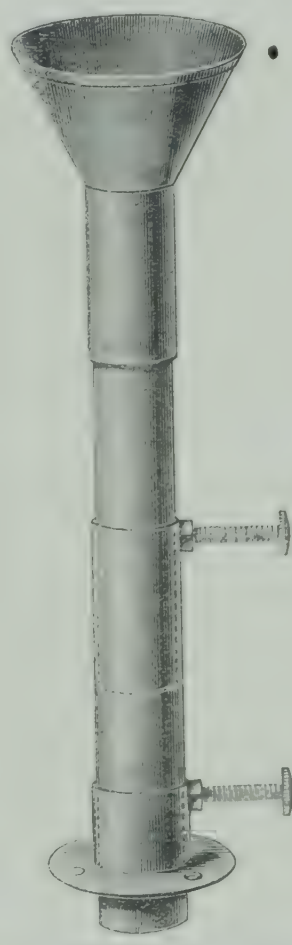

FIG. 78.—THE TELESCOPE-CUP AND TUBE (SEE P. 604.)

Messrs. Hugh Low & Co., Clapton, had an extensive and very bright group, composed chiefly of fine varieties of Cattleya labiata, that named C. l. lilacina being unique in colour. Its sepals and petals had a distinct bluish-lilac hue, and the front lobe of the lip a slate-blue blotch. Also in Messrs. Low's group were Vanda Sanderiana, V. cœrulea, the singular Mormodes tigrinum, &c. (Silver Banksian Medal).

Messrs. W. L. Lewis & Co. also secured a Silver Banksian Medal for a very effective group in which the Cattleyas, and especially C. Bowringiana, were telling features. In the centre was a batch of good Oncidium tigrinum, at one end a fairly representative group of Cypripediums of the season, and throughout the Lycastes, Sophronitis, Oncidiums, &c., were well arranged to harmonise with the rest of the group. Among the Cypripediums, C. × Robertsianum (insigne Wallacei × callosum) was striking by reason of its large, bold flower.

Messrs. Collins & Collins, Cumberland Park Nurseries, Willesden Junction, staged a most effective group, in which plants of the old form of C. insigne formed the salient feature. They also showed named varieties such as C. i. Chantinii, as well as several good forms of Cattleya maxima, C. labiata, Cypripedium callosum; and over all were drooping sprays of Oncidium varicosum, having, as a whole, a good effect (Silver Banksian Medal).

Mr. G. Young, St. Albans, showed Cypripedium insigne Youngianum and C. superbum, both of the yellow or Sanderiana class.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N. showed Phaio-Calanthe × Sedeniana rosea.

J. Forster Alcock, Esq., Northchurch, Berkhamsted, sent Odontoglossum Wilckeanum. R. G. Fletcher, Esq, Withdean, Brighton, sent Lycaste macrobulbon.

F. Wheatley, Esq., Ringmore, Teignmouth, showed Oncidium Wheatleyanum, which might be a cross between O. dasytyle and O. Gardneri (for which species it was bought). The sepals and petals are purple; the lip, which bears traces of O. dasytyle in the crest, is purple at the base, the front bright yellow, edged with brown (Award of Merit).

M. Jules Hye Leysen, Coupure, Ghent, showed Lælio-Cattleya × albanensis.

J. W. Temple, Esq., Leyswood, Groombridge (grower, Mr. Bristow), showed Cattleya × Miss Williams (Harrisoniæ × Gaskelliana), with neat light rose flowers and purple blotch on the lip.

H. Grinling, Esq., Harrow Weald House, Stanmore (gr., Mr. Rapley), showed a remarkably fine plant of a good form of Saccolabium bigibbum (Botanical Certificate).

Admiral Cator, Hazelwood, King's Langley (gr., Mr. Geo. Day), sent Cypripedium Victoria Mariæ, like a colourless C. Chamberlainianum; and Sir Archibald Buchanan, Hepburn, Prestonkirk, East Lothian, sent two examples of the form of Lælia autumnalis known in gardens as Arnoldiana.

Fruit Committee.

Present: T. F. Rivers, Esq., in the chair; and Messrs. W. Wilks, A. Sutton, R. Hogg, J. H. Veitch, H. J. Pearson, G. Bunyard, A. H. Pearson, T. J. Saltmarsh, J. A. Laing, G. Reynolds, F. Q. Lane, H. Balderson, J. Smith, W. H. Divers, and J. Cheal.

Several varieties of Endive came from the gardens of the Society, namely, the Green Batavian, in blanched and unblanched condition; and the broad-leaved Batavian. The first is the best kind of Endive grown, being, when well blanched, tender and crisp, and of a nice creamy-white tint.

Mr. J. Johnson, Ampthill, Beds, showed about one score of Sutton's Improved Long Surrey Carrots, showing the results following on selection carried on for three years. The roots, averaging 21 inches in length, were clean, straight, of good colour, and fine texture. It is a variety well suited to deep, friable, sandy loams, that are free from stones (Cultural Commendation).

Messrs. W. & J. Brown, 56, High Street, Stamford, showed Brown's South Lincoln Beauty Apple; it has some resemblance to Ribston Pippin and Cornish Aromatic, but it came from Cox's Orange Pippin; it is said to be a great bearer (a First-class Certificate).

Fruits of Solanum guatemalense, yellow, with chocolate stripes, and of the size of a bantam's egg, were shown by Mr. Hopkins, gr. at High Cross, Framfield.

Mr. Holden, Rhyl, showed a quantity (twenty-four plates) of Mère de Ménage Apple, of a particularly dark tinge of colour (Vote of Thanks).

An Award of Merit was given to Messrs. T. J. Saltmarsh & Sons, Chelmsford, for specimens of the fine Pear, Le Lectier. Some Coe's Late Red Plum came from Mr. Crook, gr. at Forde Abbey.

Some beautiful dishes of Orange Pippin, the produce of orchard house trees, came from Messrs. T. F. Rivers & Sons, Sawbridgeworth. They were far beyond the average size of this variety of Apple.

Mr. J. Walker, nurseryman, 7, High Street, Thame, showed sixty-four bulbs of his exhibition Onion, of great size and well matured. It is a flattish bulb of a light brown colour (Bronze Banksian Medal).

A very nice collection of Pears (fifty-two varieties) came from the Duke of Rutland's garden at Belvoir Castle (gr., Mr. W. H. Divers). Amongst varieties rarely seen were Beurré Dubuisson, a Pear resembling B. Hardy in form and colour (First-class Certificate); Maréchal Valliant, Bellisme d'Hiver, President Mas, Beurré Sterckmann, British Queen, Doyenné d'Alençon, Josephine de Malines, Madame Millet, Soldat Labourer, Winter Nelis, Emile d'Heyst, and Doyenné du Comice. Of extra large size were Beurré Rance and Glou Morçeau. (Silver Knightian Medal).

Lecture on Raising New Chrysanthemums.

In commencing, Mr. Shea said that seed-raising had given him great pleasure, and would give the same to others who pursued the work with determination, and upon scientific and definite methods, but at the outset it would be well to consider what one had to compete against, and not to ignore the fact that France and the greater part of the Continent, besides China, Japan, and the United States of America, in addition to the trade and other growers in our own country, were all doing the same thing, and thus one individual's chance of raising anything that shall gain the world's notice, as well as interest ourselves, was but small. In addition, whilst the climate of France and other countries was just that required for such a purpose, that of our own was distinctly against the endeavour, and a climate like that of sunny France had to be provided as nearly as possible in the houses here during December, January, and February. On the other hand, we gained indirectly in this country by being obliged to keep our plants inside, and therefore they are not subjected to the visits of insects and such injurious agencies as work outside.

To commence in a small way, a greenhouse would be wanted about 12 feet by 8 feet, and it must be built in such a manner that dripping and damp can be eliminated. The paths must be cemented, and on an incline, to ensure that all water pass quickly away. Ventilators should be so arranged that the air has to pass over the hot-water pipes upon entering the house, and, indeed, every means that can be used to keep a warm, moving, dry atmosphere, should be adopted.

In selecting plants as subjects to work from and upon, the seed-raiser must not choose overgrown plants that have been cultivated for exhibition blooms. A double flower is not required, as the essential organs are destroyed or impaired by excessive cultivation. The variety may be the best double possible, but a flower with a more or less open centre is required. The construction of the flower was then described. Mr. Shea said that the greatest care was required that the pollen be conveyed to the stigma at exactly the time the latter is in a ripe state to receive it.

That was where, in the majority of cases, the mistake occurred. The organs appeared to be ready long before they are, and then the peculiar means nature had provided in the Chrysanthemum and other plants was described, whereby self-fertilisation was rendered infrequent, Mr. Shea saying that the anthers have opened, and the pollen is all scattered before the two lobes of the style have opened at all, so that if the stigma of one plant is fertilised, it will almost be sure to be so by the pollen of another plant. The correct time, then, for effecting pollenisation must be known, and when both anthers and stigma are ready, the process of taking a camel's hair brush and touching the anthers of the plant to be used as the male parent, and conveying the pollen to the stigma of another plant was a simple matter. It should be repeated each day for a week, and about noon was the most suitable time. The lecturer had never known in his experience a case so treated that had failed.

The next important question would be, how to ripen the seed. Aphis, thrips, and other insects, beside bad atmospheric conditions, were enemies that would have to be contended with, and in regard to the former, the house must be fumigated just as often as the plants required it. When the seed has formed, Mr. Shea has found that the practice of some American raisers of cutting off the petals was not advisable in this climate. They would serve as a safety-valve to carry off any excess of sap, and they should be left until they are withered and then removed, or they may harbour insects.

In regard to raising double varieties, Mr. Shea had found that the seed from the circumference will produce the highest percentage, and seed from the centre, or near it, the greater proportion of single varieties. The same phenomena occurred in the cross-fertilisation of the Begonia. The lecturer had only three singles amongst his seedlings this season by following such a method. The best means Mr. Shea knew of determining when the seeds were ready to be taken away was by touching the disc with the fingers, in order to see if the seed would fall. The centre of the discs are cut out, to avoid single varieties, as soon as the heads are collected. Suggestions were then given as to the selection of varieties for crossing, and Mr. Shea said it was impossible not to keep the shows in view, and it was essential that flowers of large size should be raised. Mid-season flowers would be most popular; and to obtain them, he would cross a grand late variety with an early one of the same degree of excellence. The habit, constitution, and height of the plants must be taken into consideration, and the beauty of the flowers must not be allowed to lead the hybridiser to use as a parent-plant one growing to an enormous height. Mr. Shea instanced a variety that runs 13 feet or more, and said he kept it until it reached 11 feet, and then threw it away. Refinement in the blooms was also something to aim at. Large flowers of coarse types should be avoided, and in the matter of colour, any that are washy should not be used as parents or sought after. To raise Chrysanthemums from seed, a great deal of patience was required, and a certain amount of intelligence, but it would bring a large amount of pleasure, and would lead the experimenter on to attempt the production of sports by artificial means, and before them all lay the goal which, if Mr. Shea himself was not successful in reaching, he hoped others may, viz, the honour of raising a blue Chrysanthemum!

KENT COUNTY CHRYSANTHEMUM.

October 31, November 1.—At the annual exhibition held at Blackheath, a high quality of bloom reigned throughout the classes. There were more entries than last year, and competition was keen. In the class for eighteen incurved and eighteen Japanese distinct, there were seven competitors. The leading position was taken by Mr. S. B. Wheadon, gr. to R. J. Collier, Esq., Hawthorn, Bickley. He had fine flowers of Primrose League, E. Molyneux, Golden Dragon, Avalanche, and Princess; whilst incurved flowers were good in Lord Alcester, Baron Hirsch, Lord Wolseley, Mrs. Heale, and Violet Tomlin. A good exhibit was the 2nd prize lot of Mr. C. Payne, gr. to C. J. Whittington, Esq., Elmhurst, Bickley. Mr. W. Wells, Earlswood Nurseries, was unfortunately disqualified for showing in stands larger than allowed. He should have secured 1st honours but for this oversight. This exhibitor had the best Japanese bloom in the show (Mdlle. Thé èse Rey), and the premier incurved bloom being a grand Madame Darier. Mr. S. B. Wheadon was 1st for twenty-four Japanese distinct, who, amongst other fine flowers, had J. Shrimpton, Mdlle. Marie Hoste, Etoile de Lyon, W. H Lincoln, and Col. B. Smith; 2nd, Mr. R. Leadbetter, with a good lot of flowers. Six competitors entered for twelve Japanese blooms, and here again Mr. Wheadon was victorious; 2nd, Mr. C. Twinn, gr. to G. W. Bird, Esq, West Wickham, a very good lot. For the special prizes offered by the President of the Society, H. F. Tiarks, Esq, for twenty-four blooms, eight Japanese, eight incurved, and eight reflexed, the 1st position was won by Mr. R. Leadbetter; 2nd, Mr. C. Payne; 3rd, Mr. F. Moore. Mr. R Leadbetter was 1st for twelve incurved, the best of which were Baron Hirsch, Empress of India, Refulgens, and Madame Darrier; 2nd, Mr. T. Osman, gr. to L. J. Baker, Esq, Chertsey. Twelve reflexed, not less than six varieties, were best from Mr. Leadbetter; 2nd, Mr. Tomalin. For twelve Japanese or large-flowered Anemones distinct, Mr. R. Leadbetter was again 1st; 2nd, Mr. A. Tomalin.

The 1st position for twelve Pompons was taken by Mr. J. Knapp, gr. to F. W. Amsden, Esq., Croydon, here were good flowers of Adela, Presette, Astarte, Mdlle. E. Dordan, and Prince of Orange; 2nd, Mr. A. Tomalin. For six Japanese of any white variety, excluding Avalanche, the 1st place was taken by Mr. R. Filkner, gr. to Miss Alexander, with Puritan; 2nd, Mr. J. Pearce, gr. to Mrs. Wainwright, with Elaine, six Japanese, one variety (coloured); and Mr. C. Payne was 1st for six blooms of a coloured variety, showing good Viviand Morel; 2nd, Mr. P. Waterer, with W. Seward. Mr. C. Payne was 1st for six incurved, showing Baron Hirsch; 2nd, Mr. W. Amies, South Ashford, Kent, with Mons. Bahuant. The two following classes were reserved for exhibitors who had not taken prizes in previous years. Mr. J. Knapp was 1st for six Japanese, with Col. W. B. Smith, W. Seward, and Sunflower; 2nd, Mr. G. Norris, gr. to T. Bevan, Esq., Greenhithe.

For six incurved, 1st, Mr. G. Norris; 2nd, Mr. E. Russell. The premier position for hand bouquet of Chrysanthemums was taken by Mr. C. J. Gatehouse, nurseryman, &c., Lewisham; 2nd, Mr. F. Wells, gr. to F. G. Arbuthnot, Esq., Bexley.

Epergne or vase.—A beautiful exhibit gained 1st prize here to Mr. D. B. Crane, Woodview Terrace, Highgate; a good 2nd being Mr. C. J. Gatehouse.

In the competitions for flowers grown within a radius of 3 miles of the place of exhibition, the most successful exhibitors were Mr. J. Rhoden, gr. to J. Vavasseur, Esq.; Mr. T. Couldray, gr. to Mrs. Levy; Mr. J. Pearce, gr. to Mrs. Wainwright; Mr. E. H. Meggs, gr. to H. Pain, Esq.; and Mr. J. Bury, gr. to C. Bayes, Esq.

A very interesting section, bringing out some fine flowers, was that devoted to amateurs who are not assisted by a gardener. Dr. G. Walker, Wimbledon, showed remarkably well; as did Mr. James Moore, Greenwich; Mr. H. H. Needs, Horsell, Surrey; Mr. J. Rose, Plumstead; and Mr. R. J. Worthington.

For well-arranged and flowered groups of Chrysanthemums, the successful competitors were Mr. F. Fox, gr. to Mrs. Penn, Lee; Mr. J. Fulford, gr. to J. Wythes, Esq., Bickley; and Mr. J. Williams, nurseryman, Lewisham. And for a group of flowering and foliage plants, Mr. J. Lyne, gr. to H. F. Tiarks, Esq., and Mr. A. Tomalin were successful.

There were also classes for table plants, Primulas, &c., and Messrs. Lyne and Judge gained the special prizes for any plant in flower other than a Chrysanthemum, the best being Cattleya labiata.

Fruit was also well shown, and there were good miscellaneous exhibits by the trade.

Messrs. H. Cannell & Sons had good flowers of Chrysanthemums and French Cannas; Mr. C. J. Gatehouse, pretty wreaths of Chrysanthemums; Messrs. John Laing & Sons had a collection of Apples, and a well-arranged group of flowering and foliage plants; Mr. Williams, Lewisham, exhibited a good group of Chrysanthemums; Messrs. J. Peed & Sons, fruit.

WEST KENT.

November 6, 7.—The seventeenth annual show was held in the Public Hall, Bexley Heath, on the above dates. Cut flowers were better represented than plants, the competition in the latter not being keen, save in the cottagers' classes.

The best twenty-four cut blooms, consisting of incurved and reflexed Japanese and incurved proper, in equal proportions, came from Mr. A. Tomalin, gr. to S. White, Esq, the best of the Japanese being Mdlle. Marie Hoste, Viviand Morel, Chas. Davis, and Etoile de Lyon; the incurved comprising blooms of medium size, in good condition. Mr. J. Wakeham, gr. to Mrs. Bean, who was 2nd, had also a good exhibit, but scarcely so large or so bright.

For twenty-four incurved blooms, in eighteen varieties, Mr. A. Tomalin was also 1st, the Queen family being the chief feature.

The 1st prize exhibit of twenty-four Japanese, in eighteen varieties, was a particularly good one, comprising the best kinds, the blooms very bright and fresh; these were shown by Mr. Simon, gr. to W. Mann, Esq. Not many points behind was the next stand, from Mr. Wakeham; here the flowers were not so full.

For twelve reflexed, two excellent stands were staged, comprising Cloth of Gold, Cullingfordi, and The Christines, Mr. A. Tomalin being 1st, and Mr. E Russell, gr. to T. Pim, Esq, 2nd.

The large-flowered Anemone class was a strong one, there being but little to choose between Mr. A. Tomalin's stand, who was 1st, and Mr. E. Russell's; and with a few more days to develop them, the latter would have won.

The best six blooms of one white variety of incurved went to Mrs. Heale, shown by Mr. A. Tomalin; and the 1st for six of any coloured variety to Lord Alcester, also from Mr. Tomalin. The best half-dozen pure white Japanese were of Mdlle. Marie Hoste, large and even; and the best of any coloured variety were superb blooms of Chas. Davis, the exhibitors being respectively Mr. A. Tomalin and Mr. J. Wakeham.

Plants consisted of groups and specimens, the best of the former in the larger class being staged by Mr. J. Wakeham, Danson Park, whose plants bore some extra fine blooms, whereas those of his antagonist were getting stale; in the smaller class a very creditable group was arranged by Mr. H. J. Nobes, gr. to C. Holme, Esq. The best-trained plants came from Mr. E. Russell, who was 1st for both dwarf plants and standards.

Some good fruit was shown, notably the three bunches of Mrs. Pince Grapes from Mr. J. Wakeham, and the Pears from Mr. E. Russell.

Vegetables also were good. The cottager's exhibits of vegetables and Chrysanthemums both as plants and cut blooms were particularly good.

SEVENOAKS AND WEST KENT CHRYSANTHEMUM.

November 6, 7.—The tenth annual exhibition was held in the Club Hall on the above dates, and the show was, on the whole, a good one. Mr. S. Cooke, gr. to D. B. Crawshay, Esq., Rosefield, was 1st for a tastefully-arranged group, and was closely followed by Mr. Hughes, gr. to J. Dixon, Esq., Edenhurst. For six blooms, one variety, Mr. R. Potter, gr. to Sir Mark Collet, Bart., St. Clere, was 1st, and Mr. Hughes 2nd.

In the class for twelve Japanese blooms, distinct varieties, Mr. Hughes led, and was followed by Mr. Potter. Mr. S. Cooke was 1st for twelve Japanese, in not fewer than eight varieties; and 2nd, Mr. Tebay, gr. to Mrs. Rycroft, Everlands.

Twelve incurved blooms, distinct varieties, were best from Mr. A. Gibson, gr. to T. F. Burnaby Atkins, Esq., Halstead Place; Mr. Hughes 2nd. Twelve incurved blooms, in not fewer than eight varieties, were best shown by Mr. S. Cook, Mr. Tebay being 2nd.

Ferns were well shown by Mr. Hough, gr. to M. Lambarde, Esq., Beechmont, and Mr. Hughes. Table plants were best from Mr. Hancock, and Primulas and Poinsettias from Mr. Latter, gr. to Mrs. Tooth, Park Farm.

Mr. Potter led with Black Grapes and cooking Apples; and Mr. R. Edwards, gr. to G. H. Field, Esq., Beechy Lees, was 1st for dessert Apples, and four dishes of Pears.

Collections of vegetables were numerous, and Mr. Edwards was 1st in a class for twenty-four of six varieties, Mr. Cooke being 2nd. Prizes in class 25 were offered by Mrs. Seale, Vine Nursery, Sevenoaks, and Mr. Edwards was again 1st; Mr. Heath, gr. to Mrs. Petley, Riverhead, being 2nd. Prizes in class 26 were offered by Mr. Webber, Tonbridge, and the 1st prize fell to Mr. Farmer, gr. to J. S. Norman, Esq. For prizes for a collection of vegetables, offered by Messrs. Carter & Co., Mr. Rivers, gr. to Miss Northey, was 1st, and Mr. Huntley, gr. to the Rev. Curtis, was 2nd.

Groups for effect, 1st, Mr. Heath; 2nd, Mr. Read, gr. to Admiral Miller, Fernside. Incurved trained plants were best from Mr. Hilton, gr. to J. Drummond, Esq.; and Mr. Farmer; and Japanese trained plants by Mr. Heath and Mr. Huntley. In the Pompon class for trained plants, Mr. Huntley led, and was followed by Mr. Hilton.

For twelve cut Japanese blooms, Mr. Heath was 1st; 2nd, Mr. Emery, gr. to G. Christy, Esq.

Mr. Heath was 1st for Ferns, showing grand plants of Adiantum Farleyense. Mr. Hilton led with table plants, and Mr. Huntley with Primulas.

Messrs. Terry, Clarke, Butler, and Galloway were the most successful competitors for collections of vegetables. Mrs. Seale, Vine Nursery, had a very fine arrangement of Dahlias, Palms, grasses, bouquets, wreaths, &c.; and Mr. Ryder, gr. to C. Young, Esq., The Thorns, a group of Orchids.

WATFORD CHRYSANTHEMUM.

November 6, 7—The Watford Chrysanthemum Society held their ninth Annual Show in the Clarendon Hall, Watford. The show was one of the best that has been held by the Society, and there were 40 more entries than in the preceding year.

In the open class for a miscellaneous group, the 1st prize was won by Mr. H. H. Gibbs, M.P. (gr., Mr. Beckett), and for a smaller group Mr. C. R. Humbert (gr., Mr. Ashdown) was 1st. The exhibit in the latter class secured the silver cup for the best group in the show, and Mr. Colchester's special prize. The 2nd awards were gained by Mr. G. J. Beer (gr., Mr. Plumb), and Mr. W. K. D'Arcy (gr., Mr. Tidy).

For cut blooms, Mr. H. H. Gibbs was again successful in obtaining two 1st prizes, offered for twenty-four incurved and twenty-four Japanese varieties, Mr. T. F. Blackwell being 2nd in both cases. The other principal prize-takers in the open classes for cut-blooms were Mr. C. Van Raalte, Mr. J. Larkin, Mr. Gilclan, and Hon. A. Holland Hibbert. Mr. W. K. D'Arcy won the premier award for Black Grapes, Mr. H. H. Gibbs, M.P., gaining 1st prize for White Grapes, and also obtained a similar success for a collection of vegetables.

Two of the special prizes for blooms were obtained by the latter gentleman, and the special awards for Mushrooms went to Mrs. Robins and Mr. S. Tapnell Holland.

In Division II., open to members only, Mrs. Robins (gr., Mr. Wilson), was 1st, for a miscellaneous group, the exhibit also taking a silver cup and the silver medal offered for best exhibit in the show. The Right Hon. Lord Esher (gr., Mr. Brown), took 2nd place. The other leading winners in this division for cut blooms were, Mr. C. Van Raalte, Mr. A. Henty, Mr. G. J. Beer, Mr. W. K. D'Arcy, Mr. J. Larkin and Mr. Bosanquet. The chief awards for twelve bunches of Pompons and Anemone Pompons went to Mr. R. Henty (gr., Mr. Brown), with Mr. H. H. Gibbs, M.P., as 2nd.

Messrs. Scrivener & Co., as in former years, were again the most successful in the wreaths and crosses, winning the three first prizes, as well as taking 1st for the best bouquet of Chrysanthemums. Mr. Kettle and Mr. Darby each took 2nds in these classes.

Amongst other 1st prizes taken by Mr. H. H. Gibbs, M.P., were those for table plants, collection of fruit, dishes of Pears, six Cyclamen pots and collection of vegetables. Mr. D. Hill obtained the leading award for Apples, Mr. S. T. Holland taking a like prize for six Primulas; and Mr. T. F. Halsey, M.P., won 2nd in the latter class and 1st for vegetables, as also did Mr. Gilclan and Rev. F. H. Hodgson. The Dowager Duchess of Bedford secured 2nd for twelve table plants.

The chief prizes in the classes for members not employing more than three gardeners were as follows. The best prizes for groups went to Mr. C. Braithwaite (gr., Mr. Wearing), and the Right Hon. Viscountess Malden (gr., Mr. Wilks); whilst the similar awards for cut blooms were given to Mr. W. F. D. Schreiber, Mr. E. Mawley and Mr. R. Debenham. The other leading trophies fell to Dr. Brett, Mr. D. Hill and Mr. S. Taprell Holland.

In Division IV., for members with one gardener, the group prizes were taken by Mr. C. Braithwaite and Mr. W. E. Moore (gr., Mr. Hall), whilst for blooms Mrs. Part gained three 1st prizes (also two 1sts for table plants and Primulas); and Mr. Rowlands a 1st and 2nd as well as 1st for a collection of vegetables.

The amateur prizes for Chrysanthemums were awarded to Mr. G. Dilks and Mr. J. Woodgate, and for cut blooms Mr. J. Fox secured two 1st places.

The cottager's classes were fairly well sustained, the most successful in the ladies' class was Miss K. Mead, who secured 1st prizes for six buttonholes (gent's) and three sprays of flowers for ladies' dress, and 2nds for six buttonhole bouquets of violets and single stand of cut flowers and foliage.

TORQUAY CHRYSANTHEMUM.

November 7.—If not quite so large in extent as in some previous years, the recent exhibition was an interesting one, and as usual the place of meeting was the Bath saloons. Groups of Chrysanthemums and of miscellaneous plants were numerously staged, and the premier honours fell to Mr. J. Hill, gr. to Rev. H. Rutherford, Redcliffe, Torquay, who had a lot of well-grown plants nicely arranged. Mixed groups were seen to advantage in those of Mr. Satterley, gr. to Mrs. Matthews, Braddon Villa, Torquay; and Mr. Slowman, gr. to Captain Fane Tucker, Braddon Tor, Torquay, the prizes going in the order of the names. Orchids in three specimens were best shown by Mr. J. Medland, gr. to Morton Sparke, Esq., Rooklands, Torquay; Cypripedium Spicerianum, Vanda cœrulea, and Maxillaria grandiflora being capital plants in good condition.

Mr. Medland was likewise first for one Orchid. Mr. Satterley had the best lot of dinner-table decorative plants.

Cut blooms seemed to show a falling-off in point of numbers.

Mr. Veale, gr. to Rev. H. Simms, Newton Abbot, was 1st for thirty-six Japanese and incurved varieties in equal numbers. His blooms were of a creditable character. Mr. J. Symes, gr. to Col. Halford Thompson, Teignmouth, had the premier stand of twelve incurved varieties. Mr. Veale had a similar stand of Japanese varieties, and Mr. Satterley was awarded highest prize in the local class for the same number of the last-named varieties.

Anemone-flowered varieties were excellently shown by Mr. Veale, in stands of six blooms. Mr. Bridson, Dartmouth, had grand examples of the Anemone-flowered Delaware in the class set apart for six blooms of any one variety.

Single-flowered varieties were well-shown by Mr. T. Wilkinson in the class for six blooms of any one variety, Admiral Sir T. Symonds being shown in faultless condition.

Not the least interesting features of the exhibition were found in the non-competitive section. Messrs. R. Veitch & Sons, Exeter, had a very good representative exhibit of stove and greenhouse plants, hardy shrubs, and fruit. Messrs. B. Smale & Sons, Torquay, of Chrysanthemums; Messrs. Curtis & Sandford, also of Chrysanthemums; Messrs. Beachey, Violets in pots; Mr. Fitzherbert, Cockington, Torquay, Cyclamens; The South Devon Fruit Farm, Cucumbers, Tomatos, Apples, Pears, and Grapes. We can only speak in terms of admiration of the arrangements generally.

EALING HORTICULTURAL.

November 7.—The seventeenth autumn show held in the Victoria Hall was a fairly good one, groups and cut blooms of Chrysanthemums making pretty and attractive features. The best group came from Mr. Wickenden, gr. to R. Dawes, Esq., Edmondscote; and the 2nd from Mr. Rickerd, gr. to T. Lilley, Esq, The Croft. For a smaller group, the 1st prize was well won by Mr. C. Long, gr. to E. P. Oakshott, Esq., Orchard Dene.

Mr. C. Long was 1st for twelve incurved blooms, and Mr. Wickenden was 2nd.

Very fine were the flowers in the class for twelve Japanese. Mr. Edwards, gr. to W. Owen, Esq., was 1st, and Mr. Long 2nd. Twelve bunches of Pompons, Messrs. Edwards and Rickerd being 1st and 2nd.

For three plants (incurved, Japanese, or reflexed), Messrs. Rickerd and Edwards were 1st and 2nd respectively. In the open class for nine incurved blooms, the 1st prize (Silver Medal) was gained with some very fine flowers by Mr. C. Edwards; the same exhibitor taking 1st honours for six blooms, followed by Mr. Merridew.

Mr. Edwards was the 1st prize-winner for six large-flowered reflex, and six large-flowered Anemone blooms, in each case being very closely followed by Mr. C. Long. The rest of the classes included some for table decorations, floral arrangements, fruit, &c.

BOURNEMOUTH AND DISTRICT CHRYSANTHEMUM.

November 7, 8.—A most successful show was held on the above dates, the exhibits were more numerous than there was proper space for, and several of those for competition were far too crowded. In this direction there is need for improvement, as although the committee give size of boards, &c. to be used, in more than one class the space allotted to competitors did not allow of proper staging. The challenge cup and prize for thirty-six blooms went to Mr. J. Carpenter Garnier, Rooksbury Park, Fareham (gr., Mr. N. Molyneux). President Borel, C. Davis, International, G. C. Schwabe, were most noticeable. The National Chrysanthemum Society's certificate for the best stand also went here. A good 2nd was found in Mr. W. Baring, Salisbury. For twelve Japanese Mr. Baring was 1st, and also for six Avalanche in a well contested class; but Mr. J. Carpenter Garnier was in front for twelve of incurved varieties. Mrs. Trevor Goff was successful with "Mrs. Heale" in a class for six incurved; a stand of "Hero of Stoke Newington," from Mr. F. Richards, being close.

Mr. Ingram, Parkstone Nursery, secured the silver cup for a group of plants, fresh and bright blooms being found of all varieties represented. A second cup and the National Chrysanthemum Society's certificate was given to Mr. Fenwick for a smaller group of much merit; Mr. W. Petch winning in one of 40 feet, and Mr. C. H. Mate in one of 30 feet. It would be difficult to overrate these, but pressure of space prevents us from giving fuller notice. The 2nd prize winners were so close in the majority of cases that their defeat was an honour.

For three bunches of Black Grapes, Mr. J. W. Mitchell, gr. to J. W. Fleming, Esq, Romsey, was 1st, Mr. J. Chalk, gr. to G. Read, Esq., Salisbury, beating him in a similar number of White Grapes.

Mr. T. Tyler, gr. to N. Bond, Esq., was 1st, for two bunches of Black, while Mr. Elliott Lees, Esq, M.P., won for two of White Grapes and for a dish of any variety of Grape, and for dishes of Apples and Pears.

Vegetables were good, and many classes were well contested; a few of the most prominent names were Mr. H. Reeves, who was 1st for a collection, and also won the special prize offered by Messrs. Sutton & Sons. Mr. T. J. Hankinson, Mr. J. J. Armfield, and Mr. H. Whitcher were 1st in their respective classes.

Various forms of decoration were well represented, 1st prizes going to Miss Watkins, Messrs. G. Watts & Sons, and Mr. T. K. Ingram. The last-named was most prominent among the non-com-

petitive exhibits, and made a showy stand. Messrs. Watts & Sons had Conifers as a leading feature; Miss Watkins, Orchids; and Mr. C. H. Ratsch a shower bouquet, baskets of Chrysanthemums and many other designs.

ISLE OF WIGHT CHRYSANTHEMUM.

November 7, 8.—The tenth annual exhibition of this Society was held on the above dates at Newport. Generally the show was a good one, though the entries were fewer than last year. The Japanese blooms were very good, considering the damp weather, but the incurved flowers were of inferior quality. Specimen plants were excellent, but groups were only fair; the quality of the blooms being good, but the arrangement faulty, and the plants were too large for grouping tastefully. Epergnes and bouquets, baskets of autumn foliage, berries, &c., were good. A good collection of Dahlias was staged by Mr. Matthews, Carisbrooke Cemetery, and Mr. Williams, Gatcombe. A collection of Apples and Pears, also a small group of Orchids and Ferns, were staged by Mr. A. E. Cave, for exhibition only.

ISLE OF THANET CHRYSANTHEMUM.

November 7, 8.—This exhibition was held in the Hall-by-the-Sea, Margate, and was a most extensive one in every respect. In addition to Chrysanthemums, the mixed groups and other plant classes, as well as fruits and vegetables, were good. For the best group of Chrysanthemums, Mr. Cornford, gr. to H. Powell Cotton, Esq., Quex Park, Birchington, won in a most creditable manner, the blooms being large and fresh with no overcrowding. Mr. Broomer, gr. to R. H. Clark, Esq., Westwood, Ramsgate, came in a good 2nd, with a better finished group, but the blooms on the whole were not so fine. For a mixed group of stove and greenhouse flowering and foliage plants, Mr. Cornford was again 1st. The chief feature in the group being a profusion of Cypripedium insigne, with Cattleyas and Oncidiums, as well as light-coloured Bouvardias. Mr. Bing, gr. to J. Bailey, Esq., Margate, followed in this instance with a bright group.

For four trained plants of incurved varieties, for six of any variety, and for four Japanese, the competition was not so close, but the winners of the 1st prizes all showed well. For twenty-four cut blooms, Japanese and incurved, in equal numbers, Mr. Tedd, The Gardens, Ulcombe Place, Staplehurst, was 1st by only a few points, his strongest being the incurveds of which M. Bahuant, Empress of India, C. B. Whitnell (extra fine). Alcester, Lucy Kendal, Madame Darrier, Violet Tomlin, and Cherub (a very fine bloom), were the best; and of the Japanese, G. C. Schwabe, Sunflower, Etoile de Lyon, Miss Dorothea Shea, and Beauty of Castlewood; Mr. D. Fairweather, gr. to J. A. Miller, Esq., Bifrons Park, Canterbury, was an excellent 2nd.

For twenty-four incurved varieties, Mr. Cornford was 1st with a first-class stand of blooms, Princess of Wales, Miss Haggas, M. Darrier, Mrs. Coleman, Violet Tomlin, Empress of India and Queen of England, all being of fine colour and form; Mr. Bing who was 2nd, had smaller, but very neat and well finished blooms. Mr. Cornford was 1st for twelve incurved varieties, with similar sorts in good condition. The finest stand in this class was disqualified for staging both Golden Queen and John Lambert, which are by the National Chrysanthemum Society official catalogue deemed synonyms; Mr. Roberts, gr. to J. Sebag Montefiore, Esq., East Cliff, was 2nd. The best half-dozen incurved came from Mr. Standing, gr. to W. Gay, Esq, Grove House; and the three best of one variety, from Mr. Bing, whose choice was Golden Queen. In the class for twenty-four Japanese, Mr. Roberts was 1st, in a keen competition; Mr. Miller, gr. to J. T. Friend, Esq., Northdown, was a close 2nd. Mr. Cornford was again 1st for twelve Japanese in variety, staging a good selection. Mr. Miller followed. Mr. Miller was more fortunate for six varieties, winning with fine flowers of Sunflower, Colonel Smith, and others. For three of one variety he was also easily 1st with Charles Davis, of extra colour and size. Mr. Cornford following. The last-named won for twelve reflexed varieties, having very good flowers; and Mr. Bing followed. Mr. Cornford had also the best twelve large-flowered Anemone. For twelve bunches of Chrysanthemums, three blooms to a bunch, Mr. E. Hawkins, gr. to Sir R. Wright, was 1st, showing each bunch loosely arranged, the flowers very fresh and of decorative size. An excellent class was provided for five plants of Chrysanthemums in 6-inch pots suitable for table decorations, the 1st prize going to plants well suited to the purpose. The amateur classes were, in addition to the foregoing, a very noteworthy feature of the show.

EDINBURGH BOTANICAL.

November 8.—This Society held the first meeting of its fifty-ninth session on the above date, at 5, St. Andrew Square, Professor F. O. Bower, F.R.S., the President, taking the chair. The private business of the Society was principally that of the election of office-bearers for the session of 1894 95, the members whose names appeared on the balloting-sheet being voted for unanimously. Several finely-finished models illustrating Phyllotaxis, and others showing the three positions of ovules, for teaching purposes, were exhibited by Professor Balfour, F.R.S.; while from the Museum of the Royal Botanic Garden, fasciated inflorescences of Uraria crinita and Tamus communis were shown. The communications of the Society was commenced by the President, who for his address gave a paper, with lantern illustrations, on the Reduction of Chromosomes. At the conclusion of the paper, a vote of thanks was proposed by the Rev. David Paul, M.A., to Professor Bower for his interesting paper, this being seconded by Professor Balfour. In the absence of the writer, Professor Balfour read a paper upon the occurrence of Cystopteris montana, in Stirlingshire, by A. Somerville, B.Sc. In his report on the vegetation in the Royal Botanic Garden, Mr. Lindsay, the Curator, gave a list of plants flowering in the rock garden, during the months of August, September and October. A report on the meteorological observations in the garden, was given by A. D. Richardson. In his notes on plants in the plant houses, Mr. R. Harrow, mentioned two plants raised from seed forty-five years old, namely Cassia mimosoides v. Wallichiana, and Ipomœa coccinea. These were originally received from the Botanic Garden, Saharapur, in 1849, and presented by Mr. W. Loudon, one of the Fellows of the Society, to the garden amongst fifty five packets of seeds, the two species under notice only germinating. The President at the close of the meeting read a list of the number of members now upon the books of the Society, which on comparison with previous years shows a favourable increase.

CIRENCESTER CHRYSANTHEMUM.

November 8.—This exhibition took place in the spacious Cornhall of this picturesque Gloucestershire town on the above date, and the result must have been very gratifying to the promoters, as the hall, with its approach, lobby, and ante-chamber, were full of praiseworthy exhibits, autumn-flowering plants, fruit, and vegetables finding a place in the schedule of prizes.

Groups of Chrysanthemums and foliage plants, and also of other plants, both foliaged and flowering, were arranged round the sides of the hall. The 1st prize for Chrysanthemums went to A. Cator, Esq., Coates (gr., Mr. D. Elkins), a striking Palm being in the centre, surrounded with Chrysanthemums possessing blooms of high quality, and faced with small Ferns, Palms, &c. In addition to the 1st prize, the Silver Medal of the National Chrysanthemum Society was also awarded to this group. The 2nd prize went to Colonel Chester Master, The Abbey (gr., Mr. W. Taylor). All the plants of Chrysanthemums were grown in a natural manner. In the class for a single specimen, fine examples of Viviand Morel took the leading prize. The best came from J. Taylor, Esq., Rendcombe Park (gr., Mr. H. R. Saunders); Mrs. W. Brewin (gr., Mr. G. Bignell), was 2nd.

Mrs. W. Brewin secured the 1st prize for six plants of Japanese, having well-grown and bloomed examples of Viviand Morel, Bouquet Fait, Source d'Or, La Triomphante, &c.; Mr. J. Taylor being 2nd.

Three plants of Japanese, the same of incurved, and also singles, brought a good competition. Smaller groups of Chrysanthemums and of stove and greenhouse plants were also staged; and there were classes for Chinese Primroses, Poinsettias, Cyclamens, &c., all being of a highly creditable character.

An open class for thirty-six blooms of Chrysanthemums, eighteen incurved and eighteen Japanese, brought a good competition, the 1st prize being taken by Mrs. Bulley, Marston Hill, Fairford (gr., Mr. G. Price), for an excellent collection, among the Japanese being Charles Davis, W. Seward, Mdlle. Thérèse Rey, Van der Heede, Mrs. C. H. Payne, Mdlle. Marie Hoste, Primrose League, W. Tricker, Beauty of Exmouth, Gloire du Rocher, Alberic Lunden, Florence Davis, &c.; and of incurved, Jeanne d'Arc, Madame Darrier, M. R. Bahuant, Mrs. Robinson King, Violet Tomlin, John Lambert, Baron Hirsch, Refulgens, &c.; 2nd, Mrs. C. Hooper, Stroud (gr., Mr. R. Fawkes), who had capital blooms also, though a little smaller.

With a dozen varieties of incurved, and also in the class for twelve Japanese, Mrs. Bulley took the 1st prize, with excellent examples.

Six Japanese, one variety, were represented by some fine blooms of Avalanche from Mrs. Bulley, who was again 1st; Mr. A. Cator coming 2nd with brilliant E. Molyneux. Mrs. Bulley was also 1st with half-a-dozen blooms of one variety, having Jeanne d'Arc; Mr. J. L. Burgess coming 2nd, with Lord Wolseley.

With eighteen Japanese, Mrs. Bulley and Mr. A. Cator were 1st and 2nd, both with excellent blooms.

Epergnes of Chrysanthemums were very good indeed, and a popular feature. Mrs. Sare, the Fleece Hotel, was 1st; and Mrs. Wearing a very good 2nd.

Baskets of Chrysanthemums and foliage made a very interesting feature, Mrs. Sare being again 1st, and Mr. Dyer 2nd. Equally pleasing were baskets of autumn foliage; the Hon. Mrs. Wilmot was 1st. Mrs. Sare also had the best bouquet.

Some very good Grapes, Apples, and Pears, were shown; also Potatos, baskets of vegetables, &c, but time did not admit of gathering particulars. It should be mentioned that an interesting collection of fifty dishes of Apples and Pears, staged by Messrs. J. Jefferies & Son, nurserymen, Cirencester, was highly commended.

The arrangements were perfect in the hands of the Hon. Sec., Mr. H. Frank Sare, and an excellent working committee.

BRIXTON AND STREATHAM HORTICULTURAL.

November 8, 9.—This suburban society held its annual exhibition in the Town Hall, Streatham, on the above dates. There was a perceptible falling off in the cut-bloom classes, and in those for groups and specimens of Chrysanthemums, but the miscellaneous classes were well filled, particularly those for Orchids, Ferns, Palms, and other foliage plants.

The best group, both for quality and effect, was set up by Mr. Mursell, gr. to Mrs. Barton, consisting of the best whites, yellows, and bronzes, of the Japanese section in beautiful harmony, the front plants being scarcely more than 1 foot in height.

The best six specimens were admirable examples, staged by Mr. Weston, gr. to D. Martineau, Esq.

The best three specimens were very fresh and bright, and came from Mr. Swain, gr. to E. Jones, Esq. For three standard Pompons, Mr. Swain was again 1st, with well-bloomed plants of medium size.

In the cut-bloom classes, with twenty-four incurved, Mr. Poulton, gr. to C. J. Cayley, Esq., was easily 1st, showing an even stand of fresh flowers.

Mr. Mursell won the 1st prize for twenty-four Japanese, with a grand lot of blooms, large, fresh, and in good variety, the best being Madame Thérèse Rey (extra fine), Sunflower, Tribune, Excelsior, G. W. Childs, and Thos. Wilkins; Mr. Owden, gr. to A. Morris, Esq., was a good 2nd.

Mr. Poulton was 1st for twelve varieties, the best of which in a good lot were Madame Hoste, Col. Smith, and Mrs. F. Jameson; Mr. Gray, gr. to L. Hanson, Esq., was a close 2nd.

For six varieties, Mr. J. W. Stevens, gr. to M. Voss, Esq., was 1st. Some good stands of Pompons were staged, the best coming from Mr. Cherry, gr. to Mrs. Gabriel, rubra perfecta, and W. Westlake being the best; Mr. Guyett following closely for 2nd.

For twelve varieties of broad-petalled Japanese incurved, Mr. Mursell was again 1st, showing a strong lot, Mons. Panckoucke, Pearl Beauty, and Edwin Molyneux being his best. With twelve blooms of any Japanese varieties upon stems not less than 15 inches in height, no wires to be used, Mr. Mursell could not be beaten; Mr. Poulton followed with a good stand. The last-named exhibitor took 1st for twelve of any section, open to single-handed gardeners only. A special Award of Merit was made to Mr. Mursell for an extra exhibit of Madame Thérèse Rey, very fine blooms. For the most tasteful arrangement of Chrysanthemums in a basket, Miss C. M. Crook, Palace Road, Streatham, was 1st, showing a beautiful combination of bronzy foliage with a Japanese variety of a similar shade; Miss E. Whittard was 2nd.

Orchids were extensively shown and in excellent

condition. The best six came from Mr. Ranson, gr. to J. T. Gabriel, Esq., Cattleya Dowiana, C. Bowringiana, and C. labiata being extra good. Mr. Fulbrook, gr. to B. Baker, Esq., had the best three, and Mr. Mursell the finest specimen Cypripedium insigne with about thirty flowers.

A vote of thanks was accorded to J. A. Whittard, Esq., of Clapham Park, for a miscellaneous collection of stove and greenhouse plants, and a Silver Banksian Medal to his gardener, Mr. H. Wright.

TADCASTER PAXTON.

November 9.—This Society held its third annual show of Chrysanthemums, flowers, fruit, plants, and vegetables in the Town Hall, Tadcaster, on the above date, and in the number and quality of the exhibits, it was a distinct success. Mr. T. Fielden, of Grimston Park, exhibited (not for competition) a magnificent group of Chrysanthemums, and a splendid collection of Apples and Pears, showing kinds suitable for the northern climate.

In the class for groups of Chrysanthemums arranged for effect, Mr. T. J. Padman secured 1st; Mr. H. Bromet, who was 2nd, had by far the better flowers, but his arrangement was bad; Masters R. and H. Colley, aged respectively thirteen and nine, were awarded 3rd. The show was opened by Mrs. Fielden, of Grimston Park. Mr. Clayton, of Grimston Gardens, and Mr. McIntosh, of York, were the judges.

DEVON AND EXETER HORTICULTURAL.

November 9.—What the committee are proud to describe as the one hundred and eightieth exhibition of this society was held on the above date, and may be described as a good average one in point of quality, though the exhibits were less numerous than at the last autumn show. Had the fixture been a week later it would have suited some exhibitors better, but, on the other hand, a wet November in Devonshire, with its natural humidity of climate, so charges the atmosphere with moisture that growers have had the utmost difficulty in keeping their blooms from damping off. Pears were well represented, but Apples were not up to the standard of recent years, either in size or colour.

Chrysanthemums, Groups.

In the premier class for plants covering a circle of not more than 9 feet diameter, and consisting of not fewer than eighteen varieties, Mr. W. Brock, Parkerswell (gr., Mr. Rowland) was 1st, and Mrs. Sim, Knowle (gr., Mr. Williams) 2nd. The two groups were well put together, but differed greatly in style, Mr. Brock's being exceedingly dwarf, the plants in it ranging from 1½ to 4 feet in height, and forming a beehive-like mound of pretty and well-furnished Chrysanthemums, fringed with Adiantums, and crowned with a magnificent Palm—Kentia Belmoreana—which gave a dignified finish to the group. Mrs. Sim's group beat Mr. Brock's in regard to quality of bloom, and contained some exceedingly well-grown plants, but being taller—3 to 5 feet—it was lacking in colour at the sides owing to want of flowers. The crown of Areca lutescens was rather light, and the colour too pale for giving a finish to a mass of colour. Although quite dissimilar in appearance, the 2nd ran the 1st very close as regarded the effect made.

In Class II., for a group of Chrysanthemums in pots, no fewer than 12 varieties, arranged with foliage plants in a circle with a diameter of nine feet, taste in arrangement to be the primary consideration, Mr. Brock was an easy 1st; Lady Duckworth, of Knightleys (gr., Mr. Bartlett) being 2nd. In this class Mr. Brock's resources in the matter of glass helped him greatly, his Crotons, Bamboos, Palms, Asparagus, Poinsettias, and other showy plants culminating with a grand Seaforthia elegans, which in the judges' eyes gave him many points over his opponents.

In the class for miscellaneous groups, not more than 12 Chrysanthemums in 6-inch pots, arranged for effect on a stand 7 feet square, and raised 1 foot from the floor, the centre plant not to exceed 10 feet in height, Mr. Brock and Lady Duckworth again carried off the honours, the former winning easily. The premier group was comprised of Bouvardias, Poinsettias, Cyperus variegatus, Calanthe Veitchi, Cattleya maxima, Cypripedium Spicerianum, Crotons, Richardia, and a fine crown of Cocos plumosa, the outer edge being fringed with Panicum variegatum. Lady Duckworth's group had some very good Poinsettias, Draccenas, and Acacias, and two very large and handsome Ricinus zanzibarensis.

Table plants were an indifferent lot; Primulas only fair; but the Cyclamen from Mr. Thos. Turner, Cullompton (gr., Mr. Madge), were very good indeed. Bouvardias, Violets, Solanums, and Poinsettias were of average quality, Violets being rather above the average in bloom.

Cut Blooms.—Thirty-six Japanese, distinct. The judging of this class was rendered doubly difficult by a knotty point arising as to the identity of a bloom in Mr. Hammond Spencer's entry, which was labelled Beauty of Teignmouth, the judges finally deciding that it was Duke of York. There being another bloom of Duke of York in this exhibit, it was disqualified on the ground that only 35 distinct varieties had been staged. It was, unquestionably, very hard on Mr. Foster, Mr. Hammond Spencer's gr., for this same variety had been shown in London as Beauty of Teignmouth. At the same time, the strong resemblance to Duke of York was there remarked upon, and the doubt expressed as to whether there was any practical difference. When looked at casually, the two blooms seemed to be distinct varieties, but a minute comparison showed the points of resemblance; and as shown in this stand the judges reluctantly came to the conclusion that there was no alternative but to disqualify. Mr. Vincent Stuckey, Langport (gr., Mr. Lloyd), took the President's Prize, a Silver Cup, and the certificate of the National Chrysanthemum Society, the 2nd prize going to Miss Fripp, Teignmouth (gr., Mr. Stiles), and 3rd to Mr. Henry Hill, market gardener, Whipton. In the winning entry were fine blooms of Duke of York, Madame Calvat, W. H. Lincoln, Mdlle. Thérèse Rey, Waban, white Louis Bœhmer, Mr. A. H. Neve, Madame Capitant, Beauty of Castlewood, International, and D. B. Crane. In the 3rd prize lot was Stanstead White, to which was awarded the special prize for the best Japanese bloom in the Show. It was undoubtedly a magnificent bloom, very fresh, and indeed hardly at its best. In this class Mr. W. Cross, Sidmouth, staged a fine specimen of Hairy Wonder.

For six white Japanese, Sir John Shelley, Bart., Shobrooke Park (gr., Mr. Mairs), was 1st with Beauty of Exmouth; Mr. W. H. Fowler, Taunton (gr., Mr. Hawkins), being a good 2nd with fine blooms of Mdlle. Thérèse Rey. In the six yellow Japanese, Sir Wm. Walrond, Bart., Bradfield (gr., Mr. Heath), was 1st with W. H. Lincoln, Mr. Hammond Spencer coming in 2nd with the same variety. For six of any other colour, one variety, Sir Wm. Walrond was first with Viviand Morel, Mr. W. H. Fowler 2nd with E. Molyneux.

The incurved classes were comparatively weaker, the 1st—for 18 blooms—going to Miss Fripp, who staged nice blooms of Brookleigh Gem, Lord Alcester, Empress of India, Prince of Wales, and Mrs. S. Coleman. Anemone flowers and Pompons were rather uneven, and nothing very special in point of quality or number.

Grapes were shown in fine condition, though there were not any very heavy bunches.

Apples were not up to the mark. The 1st prize for 24 dishes, distinct, was awarded to Lord Poltimore, Poltimore Park (gr., Mr. Martin), whose collection was made up of the kinds usually seen at exhibitions. In the 2nd prize collection, won by Mr. W. F. Richards, Beaumont House (gr., Mr. Bawden), were Lucombe's Pine and Hicks' Lord Nelson, of splendid colour. A very good collection staged by Sir John Davie, Bart., Creedy Park (gr., Mr. Seward), was disqualified owing to there being two dishes labelled King of the Pippins. This was obviously an error in naming, and as the exhibitor declared the other dish to be Beauty of Wilts, and therefore distinct, it was suggested that the judges would have been within their rights in correcting the name and overlooking the evident slip, in whatever way it arose. Other critics declared the two dishes were, as named, King of the Pippins. Indeed, one of the striking features of the exhibition was the number of those who were disqualified in both fruit and flower classes for showing contrary to schedule.

Pears were very good. Sir John Shelley would have taken premier honours, but was disqualified, for instead of having six dishes dessert and three culinary as required, he staged five dessert and four culinary. Curiously enough, the next best lot—Sir John Davies—were disqualified for a similar reason. The result was that Sir Wm. Walrond came in 1st, and Sir T. D. Acland, Killerton (gr., Mr. Garland), was 2nd. The Catillacs shown by Mr. Joseph Ham, Budlake, were awarded 1st prize, the five fruit weighing over 9 lb. The Pitmaston Duchess staged by Mr. Trehawke Kekewich, Peamore (gr., Mr. Abrams), were grand fruit, while the Doyenné du Comice shown by Sir Wm. Walrond were of glorious colour. Both took 1st prizes in their respective classes.

Among the Pears staged which are not now often seen, were Knight's Monarch, Forelle, and the Black Pear of Worcester.

Apples packed for market (in boxes) were an interesting class, and showed a great advance in regard to packing, grading, and general attractiveness. The Amateur's Classes were creditable, the chief prize-takers being Mr. G. C. Crabbe, Mr. G. B. Lansdale, and Mr. W. Letheren.

Ornamental baskets of autumn foliage and berries were a pretty show, the 1st prize won by Miss Rowdon of Tiverton being an artistic production.

Trade collections were numerous and highly creditable to the firms represented, among whom were Messrs. Robert Veitch & Son; the Exeter Nurseries Co.; Mr. W. J. Godfrey, Exmouth; Jarman & Co., Chard; Mr. Watkins, Hereford; Bunyard & Co., Maidstone; Stevens & Son, Alphington, &c.

Col. Halford-Thompson exhibited a collection of plants grown in Jadoo Fibre, without earth; Mr. Stiles, Teignmouth, showed a new telescopic Chrysanthemum-tube, which seems to combine simplicity with efficacy. Blooms of the new Green Chrysanthemum, "Ethel Amsden," (a sport from Viviand Morel) were shown by Robert Veitch & Son.

The President of the Society, the Hon. Sir Stafford Northcote, Bart., C.B., M.P., presided at the luncheon. The arrangements were carried out by the hon. secretary, Mr. G. D. Cann, and a committee, in a highly satisfactory manner.

HAMMERSMITH HORTICULTURAL.

November 9.—What is the tenth autumn exhibition of this extra-urban district came off on the above date, bringing some creditable groups and cut blooms from local cultivators of Chrysanthemums. Mr. L. Woodhouse, St. Peter's Grove, showed a well-arranged group, and other groups were constructed by Mr. Bromley and Mr. Thompson. The competition for the best twelve Japanese blooms resulted in the highest prize being unawarded; whilst Mr. Wood, gr. to Mrs. Sanderson, secured the 2nd. In the six-bloom class, Mr. J. Addison was 1st with excellent specimens. Here, Mr. Wood was again 2nd. Amongst amateur competitors Mr. Tolton carried off the prize for six Japanese and six Anemones, in eight varieties; Mr. Botwright being 2nd. Messrs. Tolton, R. E. Wilson (Bromley), Botwright, and Thomson were successful in various sections, whilst Mr. T. Pitt, Secretary to the Society, secured several 1sts. Chinese Primulas were nicely shown by Messrs. Wood & Addison. Vegetables of much excellence, and some small lots of fruit and Tomatos formed part of the show.

KINGSTON AND SURBITON.

November 13, 14.—The annual exhibition of this Society was held on the above dates at the Drill Hall, as usual. Classes generally were well filled, some of the cut bloom classes bringing sharp and considerable competition. Incurved blooms were remarkably good—probably none better have been seen this season, whilst Japanese flowers were not at their best, though there were plenty of fine flowers. The reputation of the Society for its annual exhibitions was, on the whole, admirably maintained.

Plants.—Of these there were miscellaneous groups of little interest at this season of the year, the prettiest coming from Mr. F. Hopkins, gr. to Mrs. Wodderspon, Walton-on-Thames, though colour was lacking. Mr. H. Bress, gr. to W. A. Aston, Esq., Epsom, who was placed 2nd, had some good Dendrobiums and double-flowered white Primula sinensis in his group; Mr. A. Ratcliff, gr. to J. B. Johnstone, Esq., Kingston, was 3rd.

Chrysanthemum Groups were of the usual formal and very uninteresting order. Mr. G. Mileham, gr. to A. T. Miller, Esq., Leatherhead, was 1st; Mr. J. Peed, gr. to R. L. Bond, Esq., Surbiton, 2nd; and Mr. Forbes, gr. to D. Nicols, Esq., Surbiton, was 3rd. This is a class that much needs improving.

Trained Plants.—These were fairly good, some grand specimens coming from Mr. J. Swan, gr. to G. Murray Smith, Esq., Weybridge, who had Sunflower, Mr. Stevens, and Madame Lacroix, amongst Japanese; and Pink Christine, Mr. G. Glenny, and Mrs. Rundle, incurved. All some 3½ feet across, being full of bloom. Mr. S. Peed was 2nd.

In the class for three plants, Mr. Swan was the

only exhibitor, having Stanstead Surprise, Maiden's Blush, and Sunflower. With three standards, Mr. F. Knight, gr. to A. F. Perkins, Esq., Holmwood, was a good 1st, having Stanstead Surprise, Mrs. Rundle, and Viviand Morel. Mr. Swan was again 1st, with four large trained Pompons, well-flowered plants of Black Douglas, Mrs. Astie, St. Michael, and Marie Stuart.

Other plants were plentiful, Chinese Primroses especially being good. With six of these Mr. W. Mease, gr. to A. Tate, Esq., Leatherhead, and Mr. Mileham were placed equal 1st, the former plants being more compact, but both were large and finely flowered. The varieties were Marchioness of Exeter and White Lady. The best six Bouvardias came from Mr. Peed, and the best nine table plants from Mr. McGregor, gr. to Dowager Lady Hay, Putney Hill, all elegant and well coloured. There were other plants we cannot now notice.

Cut Blooms.—Again, as usual, the chief interest in this direction centred in the contest for the Challenge Vase, a fine silver tankard valued at 25 guineas. This was the seventh of these fine prizes, and that of last year was won for the first time by Mr. Flight, Twyford, Hants. This time Mr. Flight did not compete. The competitors numbered four, and their flowers were so even in many respects that a very long time was consumed in making the awards. That comes of setting five men to do only two persons' work. Eventually the cup this year was won by Mr. Higgs, gr. to J. B. Hankey, Esq., Leatherhead, with a very fine lot of flowers, which consisted of old favourites and new varieties. Mr. Jas. Quarterman, gr. to C. E. Smith, Esq., Cobham, was 2nd; and Mr. G. Hunt, gr. to P. Ralli, Esq., Ashtead Park, 3rd.

Incurveds.—Mr. Mease was an easy 1st with twenty-four very fine blooms in that class, having Lord Alcester, very fine; C. B. Whitnall, Empress of India, M. R. Bahuant, &c. Others had Robinson King, John Doughty, Emily Dale, Lucy Kendal, &c., good; Mr. W. Jinks, gr. to W. M. Grant, Esq., Cobham, was 2nd; and Mr. Higgs, 3rd.

In the class for twelve blooms, Mr. Coomber, gr. to W. Purre, Esq., Teddington, was 1st, having capital flowers, chiefly of varieties already named. Mr. F. King, was 2nd; and Mr. Elliot, gr. to P. W. Graham, Esq., East Molesey, was 3rd. Mr. Quarterman had the best six blooms; Mr. Tomlin, gr. to Mrs. Goldingham, Chertsey, coming 2nd. With six blooms of one sort, Mr. Mease was 1st with very fine Golden Empress, a superb lot of blooms, one of which was selected as the Premier incurved bloom in the show. Mr. J. Plowman had the best bunches in trebles of the three members of the brindle family.

Japanese Blooms.—In the class for twenty-four blooms, Mr. Mease was again 1st with a fine lot for the season, having Viviand Morel, Primrose League, Etoile d'Lyon, Viscountess Hambledon, E. Molyneux, Sunflower, Robert Owen, &c.; and Mr. Standing, gr. to Mrs. Good, Worthing, was 2nd; and Mr. Jinks 3rd.

With twelve Blooooms.—Mr. G. Holden, gr. to Mrs. C. W. Izod, Esher, was 1st; Mr. Coombs being 2nd; Mr. Elliot 3rd. Some capital blooms were in the respective stands.

In the class for six blooms, Mr. Quarterman was 1st. For six blooms of one variety, Mr. Hopkins was 1st with nice E. Molyneux; Mr. Springthorpe, gr. to W. Bevan, Esq., Kingston, came next with Etoile de Lyon, the new Golden Gate from Mr. Hunt being 3rd. The premier Japanese bloom was a very fine Mdlle. Thérèse Rey, shown by Mr. F. King. There were many others, and local classes, which we cannot refer to, also of decorative stands, bouquets, &c.

Fruit—The best four dishes of Grapes came from Mr. Davies, gr. to J. P. Chappell, Esq., Teddington, who had good black Alicante Grapes. Sutton's Monarch Melon, Doyenné du Comice Pears, and King of the Pippin Apples; and Mr. C. J. Waite, gr. to the Hon. Col. Talbot, Esher, was 2nd, with three bunches of black Grapes. Mr. Elliot won easily for Mr. Graham with grand clusters of Gros Colmar; the same variety from Mr. Newman, gr. to J. A. Turk, Esq., Chertsey, coming 2nd; and excellent Alicantes came from Mr. Griffin, Coombe Bank. In the white Grape class, Mr. Simmonds, gr. to W. Arvard, Esq., Twickenham was 1st with medium-sized but beautiful Muscat of Alexandria; Mr. Springthorpe being 2nd.

Apples were plentiful, the best six dishes coming from Mr. W. Adkins, gr. to W. R. Monro, Esq., Coombe Warren, Mère de Ménage, Bramley's Seedling, Wellington, Blenheim, Fearns, and King of the Pippins, being the varieties; Mr. Will Taylor, Hampton, was 2nd; and Mr. G. H. Page, Ham House Gardens, 3rd. The best four dishes of Pears came from Mr. Sage, who had good Doyenné du Comice, Marie Louise d'Uccle, Beurré Bachelier, and B. Rance; Mr. Measures 2nd. The finest basket of six kinds of vegetables came from Mr. Waite, whose samples were first rate.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 10, is furnished from the Meteorological Office:—

"The *weather* during this week was again very unsettled and changeable. Frequent rains were experienced in nearly all parts of the Kingdom, alternating with considerable intervals of bright sunshine.

"The *temperature* continued much above the mean, the excess ranging from 4° to 6°. The highest of the maxima were recorded either on the 4th or 5th, and ranged from 61° in the 'Channel Islands,' and 60° in 'England, S.,' to 54° in 'Scotland, N.' The lowest of the minima occurred towards the end of the week, when the thermometer fell to 29° in 'England, S.W.,' to 32° in the 'Midland Counties,' and to between 33° and 40° in most other districts; in the 'Channel Islands' the lowest temperature was 47°.

"The *rainfall* was less than the mean in 'Scotland, E.,' 'England, N.E.,' and 'England, E.,' but again exceeded it in all other districts; in 'Scotland, N. and W.,' 'England, S.W.,' 'Ireland, S.,' and the 'Channel Islands,' the excess was large.

"The *bright sunshine* exceeded the mean in nearly all districts, the excess in 'England, E. and S. and in Scotland, E.,' being large. The percentage of the possible duration ranged from 42 in 'England, E.,' and 59 in 'England, S.,' to between 20 and 31 in most other districts; in 'Scotland, N.,' however, the percentage was only 7."

MARKETS.

COVENT GARDEN, *November* 15.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

Supply during the past week rather short. Prices keep firm for all kinds, with a tendency to rise values for the cheaper kinds. *J. B. Thomas.*

SEEDS.

London: *November* 14.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market ill-attended and uninteresting. American Clover seed proves disappointing in quality. Some little German Red has been bought here; White continues extremely scarce. Canadian Alsyke is attractively cheap. Trefoil and Rye-grasses neglected. Bird seeds steady. Haricots advancing. White Runners brisk; Scarlet Runners promise to be much dearer. Peas steady. Linseed flat. Mustard and Rape seed unchanged.

FRUITS AND VEGETABLES.

Borough and Spitalfields: *November* 13.—Quotations:—Cabbages, 1*s.* 6*d.* to 3*s.*; Savoys, 3*s.* to 4*s.*; Cauliflowers 5*s.* to 7*s.* per tally; Turnips, 1*s.* 6*d.* to 2*s.*; Carrots, 1*s.* 6*d.* to 1*s.* 9*d.*; Parsley, 1*s.* to 1*s.* 2*d.* per dozen bunches; Horseradish, 1*s.* 2*d.* to 1*s.* 3*d.* per bundle; Onions, foreign, 1*s.* 9*d.* to 2*s.* 6*d.* per bag; do., English, 2*s.* to 2*s.* 9*d.* per cwt. Apples, 3*s.* to 8*s.* per bushel; Pears, 2*s.* to 4*s.* 6*d.* per half sieve.

Farringdon: *November* 15.—Quotations: Parsnips, 45*s.* to 50*s.* per ton; Carrots, 35*s.* to 40*s.* do.; Celery, 8*d.* to 10*d.* per roll; Onions, English, 70*s.* to 80*s.* per ton; Brussels Sprouts, 9*d.* to 1*s.* 3*d.* per half-sieve; Cabbages, 6*d.* per dozen; Cauliflowers, 1*s.* do.; Leeks, 9*d.* to 1*s.* do.; Beetroots, 2*s.* per cwt. Horseradish, 1*s.* 3*d.* per bundle; Apples, American, 15*s.* to 18*s.* per barrel; do., English, 5*s.* to 7*s.* per bushel; Tomatos 4*d.* to 5*d.* per lb.

Stratford: *November* 13.—The market has been well supplied with every description of produce during the past week

and a brisk trade has been done at the prices mentioned below:—Cabbages, 1*s.* 6*d.* to 2*s.* per tally; Savoys, 1*s.* 6*d.* to 3*s.* do.; Cauliflowers, 6*d.* to 1*s.* per dozen; do., 2*s.* to 3*s.* per tally; Celery, 7*d.* to 1*s.* per roll; Horseradish, 1*s.* to 1*s.* 3*d.* per bundle; Brussels Sprouts, 9*d.* to 1*s.* 3*d.* per half-sieve; do., 1*s.* 6*d.* to 2*s.* per flat; Turnips, 1*s.* 6*d.* to 2*s.* 3*d.* per dozen bunches; do., 25*s.* to 40*s.* per ton; Carrots, household, 22*s.* 6*d.* to 30*s.* do.; do., cattle-feeding, 18*s.* to 25*s.* do.; Parsnips, 6*d.* to 10*d.* per score; Mangels, 12*s.* to 17*s.* per ton; Swedes, 15*s.* to 20*s.* do.; Onions, English, 60*s.* to 75*s.* do.; do., Dutch, 2*s.* to 2*s.* 6*d.* per bag; do., Valencias, 6*s.* to 6*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel.

POTATOS.

Borough and Spitalfields: *November* 13.—Quotations ranged from 60*s.* to 100*s.* per ton.

Stratford: *November* 13.—Quotations:—Magnums, Dark-soil, 55*s.* to 60*s.*; do. Light-soil, 60*s.* to 70*s.*; Bruces, 60*s.* to 70*s.*; Imperators, 55*s.* to 80*s.*; Main Crop (Scotch), 75*s.* to 85*s.*; Kidneys, Main Crop, 60*s.* to 75*s.*; Bruces, 60*s.* to 70*s.* per ton.

Farringdon: *November* 15.—Quotations:—Beds: Sutton's Abundance, 80*s.* to 90*s.*; Main Crop, 80*s.* to 90*s.*; Reading Giants, 60*s.* to 70*s.*; Bruce, 60*s.* to 70*s.*; Magnums, 60*s.* to 65*s.* per ton. Essex: Sutton's Abundance, 75*s.* to 80*s.*; Bruces, 70*s.* to 75*s.*; Magnums, 70*s.* to 80*s.*; Stourbridge Glory, 75*s.* to 80*s.*; Imperators, 65*s.* to 70*s.* per ton.

London Averages: *November* 14.—Main Crops, 80*s.* to 100*s.*; Snowdrops, 80*s.* to 90*s.*; Magnums, 65*s.* to 80*s.*; Hebrons, 80*s.* to 90*s.*; Early Rose, 70*s.* to 80*s.*; Champions, 60*s.* to 70*s.*; Regents, 70*s.* to 80*s.*; Black lands, 55*s.* to 65*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending November 10, and for the corresponding period last year:—1894: Wheat, 18*s.* 4*d.*; Barley, 23*s.*; Oats, 13*s.* 7*d.* 1893: Wheat, 27*s.* 4*d.*; Barley, 29*s.* 3*d.*; Oats, 18*s.* 1*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 128*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 6*s.* to 112*s.*; do., inferior, 36*s.* to 60*s.*; Mixed, 90*s.* to 110*s.*; and Straw, 22*s.* to 38*s.* per load.

The Colours of Flowers.—At the Atlantic City Convention of the Society of American Florists, an interesting paper was contributed by Mr. F. S. Matthews, of Boston, on "Comparative Colours and their Relation to Flowers." The speaker claimed that "flowers possess the next best quality of colour to that which we see in the rainbow," and that, if petals were arranged in imitation of the prismatic colours, they would be found brilliant enough to match the tints of the rainbow. The colour fire might be gone, but the colour purity would remain. Pure blue, peacock-blue and green are the only tints that could not be obtained. Without agreeing absolutely with this sentiment, it is certainly true that the colours of flowers have a depth and brightness not to be easily imitated by any pigments of the artist; that the scarlets of certain Poppies, Cannas, and Nasturtiums, for instance, are, if not absolutely pure, brilliant in their intensity, and hard to be paralleled by Art. A systematic standard or shade-card compiled according to spectrum analysis, and stating definitely what proportions of blue and green were to be considered as "peacock;" what depth of tone constituted respectively mauve, purple, violet, &c., would, if universally adopted, save much difference of opinion and uncertainty as regards the naming of the colours of flowers. At present no two persons agree in their definition of a shade: one will term a blossom pale crimson, which by other observers is considered to be dark pink, claret, or some different variety of red. Mr. Matthews includes in his article a warm defence of brilliant magenta, as developed in certain Orchids and Cinerarias, considering the prejudice some feel against it to be due to the fact that "it is too rich and deep when seen in all its purity for any but colourists and lovers of colour to understand!" As a colour it is certainly brilliant—so brilliant that surrounding tints in combination with it frequently produce a perfectly excruciating discord. This disadvantage it is which prevents magenta blossoms from taking a prominent place for decorative purposes.

NOTICES TO CORRESPONDENTS.

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** Plants, Fruits, etc., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Asparagus Sprengeri: *Erfurt.* Asparagus Sprengeri was described by Regel in Act. Hort. Petrop., xi., 302 *J. G. B.*

Books. Standard Work on Fruit: *H. O. N. The Herefordshire Pomona.* Enquire of the publishers, Messrs. Jakeman & Carver, High Town, Hereford.

Botanical Names: *C. J. G.* The botanical name of Convolvulus major is Ipomœa purpurea; of Prickly Spinach, Spinacia oleracea var. spinosa; of Chou de Barghley, Brassica oleracea var.; and of Locust, Ceratonia siliqua.

Celery: *W. P. & S.* White Plume is the name of the variety. It has whitish variegated leaves, which are fit in the unblanched state for garnishing uses; but, if it be required for salad or stewing, it must be as well blanched as ordinary Celery before it is safe, or even pleasant to partake of it.

Celery: *Curiosity.* Probably eel-worms; send entire plant with roots.

Changing Colour of Doronicum Harpur Crewe's Var: *R. C.* We do not see how this can be done without having recourse to some kind of dyeing by absorption through the stem. Cross-breeding might result in some changes of colour.

Gardenias Losing their Leaves: *Constant Reader.* Your method of cultivation is scarcely the right one to follow at this time of the year. The night temperature is 5° too high, and the other conditions are more those of growing plants. The roots are probably infested with eel-worms, or they are otherwise in bad order. Kindly send leaves and roots for inspection.

Copyright: *B. C.* The copyright of all matters, literary or artistic, published in a journal, belongs to the proprietors of that journal, unless some arrangement to the contrary has been made prior to publication. But the proprietor of the journal cannot republish any article separately without the permission of the writer.

Diseased Beech: *R. V. & Son.* The wound on the Bark sent is like those which Nectria ditissima starts with, and there are hyphæ in the tissues which might well belong to that fungus. Such wounds, originating in various ways, are apt to become damp, and give a nidus to bacteria and other fungi, and at certain times of the year quite a mass of a slimy mixture of bacteria and fungi may ooze from them. There is evidence of this being the case here. *H. Marshall Ward.*

Hot-water Pipes in the Greenhouse: *L. G. P.* To blacken them, mix lampblack with boiled linseed oil, and paint them over once or twice.

India Rubber Plant losing some of its leaves: *A. N., Peckham.* This may be due to natural causes if the oldest leaves only fall; but, if young and old leaves fall off, it is a sign that the treatment afforded is not right, or the gas burnt in the room is having an injurious effect on the plant. This plant is apt to lose its leaves if exposed to low temperatures, but this is scarcely likely to be the case, this mild autumn. See that the drainage is in good order; and do not afford more water than will keep the soil moderately moist, *i.e.*, let the plant go without water till the soil has become somewhat dry, then water thoroughly, letting the water pass freely away; and do not let it run into a pan or saucer in which the plant may be standing. This practice of putting saucers under Palms, Aspidistras, Dracænas, Ficus, &c., is not a good one, even in the height of summer, when evaporation from the leaves and the soil is greatest, capillary attraction in the water tending to keep the soil in a constantly wet condition; and as a wet soil soon sours, the roots become affected, and the whole plant suffers in some way. Without seeing your plant, and being told of the kind of treatment followed, we are unable to give more definite advice.

Lath or Bamboo Splint Blinds: *Thea.* Excellent for all kinds of flowering plants, if they are not fixtures; and over ferneries or fern houses they may remain fixed on the roof from April to the end of September. Shelters roofed and walled-in with these blinds are capital places for retarding plants either in or out of bloom. They will not keep out rain when so employed, and that is their only disadvantage. If made with good, well waxed twine or whip-cord, they will last for half-a-dozen years without needing repairs; and with wire, if the splints are varnished, or oil-coated annually, ten years will not see the last of them.

Names of Fruits: *W. Parker.* 2, Beurré de Capiaumont; 16, Verulam; 19, Glou Morçeau; 17, Doyenné du Comice; 48, Duchesse d'Angoulême; 68, and others not known.—*M. H. B.* 1, Belle de Bruxelles; 2, Van Mons Léon Leclerc; 3, Verulam; 4, Beurré Rance. Apples, small one Colonel Vaughan; large, not sure of.—*A. Chapman.* 1, Beurré d'Aremberg; 2, Vicar of Winkfield; 5, Duchesse d'Angoulême; 4, Doyenné d'Alençon.—*H. S.* Most probably Beauty of Kent.—*T. Matheson.* 1, Uvedale's St. Germain; 2, Not known.—*W. Drummond & Son.* 1, Summer Bergamot; 2, Probably Aston Town; 4, Rymer. It is difficult to name your northern fruit.—*F. C. W.* 1, Fondante d'Automne; 2, White Doyenné; 3, Beurré Bosc; 4, Duchesse d'Angoulême; 5, Josephine de Malines; 6, Crassane.—*C. W. Strickland.* We do not recognise your Pear.

Names of Plants: *J. C. S.* 1, Clavaria fusiformis, Sow. (small); 2, Calocera viscosa, Fr.; 3, Clavaria rugosa, Fr.; 4, Polyporus chioneus, Fr.; 5, Russula Queletii, Fr.; 6, Agaricus (collybia) maculatus, Fr., *M. C. Cooke.*—*E. D. L.* Asters: 1, cordifolius elegans; 2, diffusus horizontalis; 3, Novæ Angliæ var. pulchellus; 4, vimineus.—*W. Laing.* 1, Aralia monstrosa; 2, Asplenium Adiantum nigrum acutum; 3, Davallia Tyermanni; 4, Polypodium venosum; 5, Koehleria cristata; 6, Davallia bullata.—*Jack.* 1, Aspidium Fortunei; 2, Lastrea serra; 3, Nephrodium (Aspidium) molle corymbiferum; 4, Aspidium caryotideum; 1 and 4 are commonly known in gardens as Cyrtomium.—*T. H.* Cupressus Lawsoniana.—*Inverness.* The leaves used for surgical purposes are those of Scrophularia nodosa.—*T. S. C.* 1, Pernettya mucronata; 2 Lonicera japonica, probably.—*J. W.* Bambusa Metake of gardens, properly called Arundinaria japonica.—*J. A.* We do not undertake to name florists' varieties; send them to someone who grows them largely.

Portraits of Chrysanthemum Fanciers: *W. C.* As you wish to obtain purchasers for the above, you should advertise the fact.

Sowing Seeds of Daffodils and Tropæolums (Hardy): *W. C. F.* Sow now in sandy loam, and keep the seed-pans in a cool pit, the soil being kept merely moist, one watering at the time of sowing being sufficient for a period of four weeks, if the pans are covered with a piece of slate or tile, as they should be, to exclude mice and light.

Spotted Leaves: *N. F.* The effects of drip, probably. There is no fungus at present visible.

"The American Florist": *P. P.* It is published at 322, Dearborn Street, Chicago. Communications should be addressed to American Florist Co., P. O. Drawer 164, Chicago. Price in Europe, 2 dols. yearly.

Wooden Plant Tubs: *Thea.* Make them with removeable sides if square; char the surface on the inside, and afford the outside one coat of redlead and two coats of dark green or slate coloured oil paint.

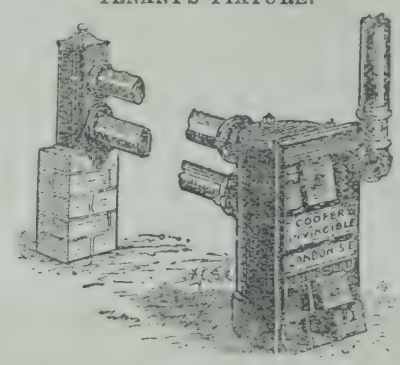
AMATEUR FORCING HOUSE.



The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

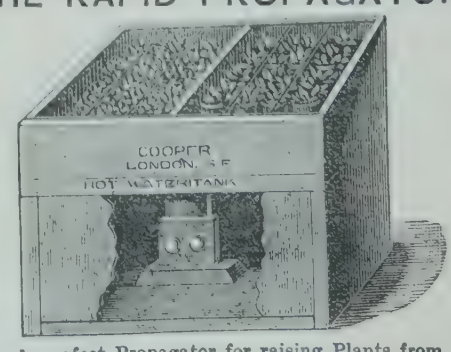
"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1, to drive 75 ft.. £1 15*s.*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s.*; No. 6, 500 ft., £9; of 4-in. pipes.

TENANT'S FIXTURE.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.



Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 45 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

THE RAPID PROPAGATOR.

The only perfect Propagator for raising Plants from seeds, slips, or cuttings:—

1 ft. 8 in. by 1 ft. 6 in.	£1	0	0
2 ft. 6 in. by 1 ft. 10 in.	1	4	0

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line* (*about nine words*) *or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

TO FLORISTS.—A young Man, age 20; four years' experience in Indoor Market Nursery Work and Cut Flowers. Good references.—G. MACKNESS, Holmedale, Church End, Finchley.

"'BY THE QUEEN'S COMMAND,' I once performed at Windsor before Her Majesty and several members of the Royal Family; and, oh, it was the most delightful experience I have ever had." The speaker was an enthusiastic young actress, as popular as she is beautiful. "The honour was certainly a great one," we murmured. "Yes," she responded quickly, "but it was not only that; Her Majesty was so kind, you know. It really did you good, the way she treated you." That is just it. Proper treatment is all we want. Nine-tenths of the sickness we suffer might be cured if we only had proper treatment. If you are ill, or feel out of sorts, seek relief from the true friends of the sick and suffering—HOLLOWAY'S PILLS and OINTMENT.

BY SPECIAL APPOINTMENT TO H.R.H. THE PRINCE OF WALES.

MESSRS. PROTHEROE AND MORRIS have much pleasure in calling attention to this Important Clearance Sale, as it is the last they will have the pleasure of conducting on the Premises this Season. CATALOGUES may be had of the Auctioneers, 67 and 68, Cheapside, London, E.C.; or on the Premises.

GLADIOLUS BRENCHLEYENSIS, extra strong flowering bulbs, 23*s*. per 1000; 220*s*. per 10,000, f.o.b. Rotterdam. Also strong LILY OF THE VALLEY Crowns, at 18*s*. per 1000; 170*s*. per 10,000. Scarlet Runner BEANS, a great quantity to offer. Apply to—
Mr. J. KOUWENHOVEN, Warmond, nr. Haarlem, Holland.

CARNATIONS, ROSES, PANSIES, VIOLAS, &c.—Her Majesty the Queen in accepting a water-colour drawing depicting a group of Empress Pansies grown by me for Her Majesty's Gardens at Frogmore, graciously expressed her interest in the details of the industry now being carried on at my Flower and Fruit Farms. This industry, which has recently been reported upon by the Government, has grown to such an extent that it is now the largest of its kind either in England or the Continent.

Any of my Customers ordering plants or trees to the value of £1 1*s*., will have a copy of the unique painting (size 30 in. by 24 in.), above referred to, sent them free of charge.

"I shall frame the beautiful plate of your 'Empress Pansies.'"—OWEN THOMAS, The Queen's Gardener, Frogmore.

Catalogues now ready, free on application.

R. BATH, Wisbech.

B. PRIMROSE,
NURSERIES, ST. JOHN'S PARK, BLACKHEATH, S.E.

CHRYSANTHEMUMS.

Our Varieties and Stock are unapproached.

This is well known by the oldest and most successful growers. As an instance, Mr. Mease and many others are again victorious in the great class with those we supplied last season. This unprecedented prize-winning has continued, with hardly a break, for many years. Vigorous and healthy cutting stock is our specialty, not prizes, &c. We have prepared the finest houses (Come and See), of cut-down un-forced plants months ago, which are now full of the loveliest soft root-cuttings, grown near the glass, ever seen, and will strike at once (while others linger for months), and will certainly ensure success wherever they go.

Send for our CATALOGUE, describing 1000 New and Old Varieties—the best kept Collection in England.

H. CANNELL & SONS,
SWANLEY.

NEW AND BEAUTIFUL HARDY SPIRÆA.
SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corymbs thickly on the plant.
It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.
FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.
Nice plants, 7s. 6d. each, will be distributed in November.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

CHRYSANTHEMUMS.
STERLING NOVELTIES for 1895.

MRS. W. J. GODFREY.
Without doubt the most beautiful Japanese and the purest white variety in existence.

Fully described in CATALOGUE, Post-free.

Miss RITA SCHROETER
Raised by CHAS. C. SHEA, Esq., from whom I have purchased the entire stock.
This variety is the only English-raised Japanese not yet in commerce, certificated at the Grand Exhibition of the N.C.S., on November 7, and it certainly is the most striking novelty of the numerous varieties certificated on that date. The blooms, which are large, may best be described as a glorified "Belle Paule," which it much resembles in colour and markings, but of double the size. Of first-class habit of growth, and an easy "doer" in every respect.
Plants, 7s. 6d. each
The most reliable Catalogue published post free to all.

COREA.

WHATEVER may be the ultimate results of the war now raging between the Japanese and Chinese, its more immediate effect will be to open up to civilisation an exceedingly interesting country. The interest of a country or place is governed perhaps to a considerable extent, and in a proportionate ratio, to our ignorance concerning it; and this is certainly the case as regards Corea. When the botanist and scientific explorer generally has completed his survey of the Hermit Kingdom, there will be, in this planet at all events, but few more worlds for him to conquer; when the shores of beautiful Yaloo, and the still more beautiful country of Corea itself, shall have been explored, a Flora of the entire world will be possible, however likely it is to be undertaken by any one man or committee of men. That this remarkable country will yield to science and to horticulture such a number and variety of garden plants as ROBERT FORTUNE introduced from China and Japan is a contingency which can scarcely be hoped for; that it will give to European cultivators many new and beautiful plants is very certain.

Some idea of Corea may be gained when it is stated that the country extends from about 34° to 42° 25′ N. latitude, and from 124° 35′ to 130° 50′ E. longitude. Native statistics tell us that the country is 1000 English miles long, and 460 miles broad, but these figures are regarded with suspicion. The nearest and most probable estimate places the area of the country at 79,400 square miles. As the area of Great Britain is 83,826 square miles, it will be seen that Corea is far from the insignificant spot which newspaper readers generally imagine. The chain of mountains running through this peninsula from north to south are covered with forests, which have, for the most part, never been explored, and are little known even to Coreans themselves. The country, like Morocco, is extremely rich in mineral wealth, gold, silver, copper, iron, and coal, being abundant. But mining is strictly prohibited, and even the peaceful employment of Potato culture is, or was until lately, visited with penalties. The chief crops are Rice, Wheat, Millet, Rye, Tobacco, Cotton, Hemp, and Ginseng. The last-named, it may be mentioned, is the highly esteemed roots of Panax Schinseng, and is said to restore exhausted animal power, and, in fact, the Aurum potabile and Elixir vitæ of a North Asiatic existence. Water Melons, the Yam (Dioscorea batatas), and the Date Plum (Diospyros kaki) play very important parts in the domestic economy of Corea, as they do in China and Japan.

That gardening, in anything like the sense in which the word is understood in this country, exists in Corea, can only be conceded in a purely courteous spirit. The Chinese fashion prevails

where there is any attempt at all at display. But the Chinese are by nature gardeners, and have, to a certain degree, availed themselves of some of the advantages of their intercourse with foreign nations. The Corean is an intellectually inferior Chinaman, who has remained encumbered with all the drawbacks of a hoary antiquity. There are no wheeled vehicles in the country, and transport from one part of the country to another is almost exclusively carried on by porterage. The chief business is a question of barter, for the coinage system is almost entirely limited to one coin. Within a short period, and in spite of themselves, the Coreans will be as much in favour of advancement as the Japanese themselves, for it is no longer possible for the Hermit Kingdom to stem the onward current of civilisation and commercial enterprise.

Poor and apathetic as are the Coreans, the matter of gardening is not by any means a neglected quantity with them. It, however, is almost exclusively confined to the Lotus pond, after which everything else is a subsidiary feature; and it is in this respect that Corea differs so widely from both China and Japan. Corea is in herself a vast wild garden of hills and dales, and the Corean has not attempted to either improve or to modify Nature. The Lotus pond varies greatly in shape, but it generally takes the form of a circle, and may, in extent, be anything from a little basin to a broad sheet of water. "Sometimes its banks are only what still remains of bordering earth; sometimes they are encased in stone settings, layer upon layer, of large granite blocks. But always, if the pond be of any size at all, there stands in its centre a singular island. This islet is perfectly circular, and in the middle of it there rises a solitary tree. In finish it is treated like the borders of the pond, left plain when they are plain, stone-capped if they are so. The tree is usually a fine old specimen of a plant, which is nearly always deciduous and not evergreen; its branches spread out beyond the confines of its little home and overhang the water. It is a pretty sight, the lone tree on the round islet; but this, on the first look, is lost sight of, for the way its singular symmetry piques the curiosity. It has a preternaturally artificial effect. It looks like one of the trees from a child's Noah's ark. It utterly despises apparently the *ars celare artem*, the attempt to deceive you into even a momentary belief that it grew there of itself; and it courts and wins attention from its very effrontery." Such is the description given by Mr. Percival Lowell, who was formerly foreign secretary and counsellor to the Corean special mission to the United States of America.

The finest example of the Lotus pond in Corea is at the entrance of the Old Palace at Söul, which was erected, so far as can be now gathered, about 500 years ago, and which is now quite in a state of dilapidation and neglect. "Two stone causeways span the narrowest part of the pond, joining the central island to the grounds without," but it differs from the ordinary Lotus pond, in that the solitary tree has given way to a superb building supported by forty-eight monolithic columns.

The Lotus pond is the one recreation of the Corean. The pond itself is nearly invariably so thickly inhabited by aquatic plants that access to the central island by means of a rudimentary kind of boat is tedious and difficult. The pond itself is densely stocked with carp, which is one of the dainties of Corean tables. The solitary-looking tree is planted in the centre that the Corean may be protected from the rays of the sun when engaged in angling after carp, and it is in such places that the richer or official classes dream away their existence. It is to them what the weekly prayer-meeting is to the country dissenter, and the occasional story-telling conclave is to the nomadic Arab, the one and almost only species of peaceful excitement which, to each of these communities, is an absorbing passion. The Corean Lotus pond is an ideal place for contemplation, and it is here that the oriental echoes in substance Tennyson's words:

"How sweet it were, hearing the downward stream,
With half-shut eyes ever to seem
Falling asleep in a half-dream!
To dream and dream like yonder amber light,
Which will not leave the myrrh-bush on the height;
To hear each other's whisper'd speech;
Eating the Lotus day by day,
To watch the crisping ripples on the beach,
And tender curving lines of creamy spray;
To lend our hearts and spirits wholly
To the influence of mild-minded melancholy."

Indebted, as the Coreans are, to China for their literature, and to a certain important degree for their language, it is natural that they should have derived nearly all their tastes from the same source. The few phases of gardening which find expression in Corea, are taken from its great helpless neighbour, whose utter defeat is at the present time superinducing a commiseration which is synonymous with contempt among European nations. In one form or another the Lotus or aquatic garden is in great favour in China. In Corea, again as in China, rockwork is an extremely popular species of gardening. The rocks used in this manner are huge boulders from 2 to 5 feet in height. They are, as Mr. Lowell points out, "either planted in the ground, or else they rest upon slabs of polished stone. The material of which the rocks consist is not over hard, for it has been honeycombed, evidently by the action of water, into most fantastic shapes. From these shapes it is at once evident that the rocks were not indigenous where they are at present found, even in those instances where no pedestal betrays the handiwork of man. They suggest at first from their dignified position, some religious intent, but this instinctive tribute to their sanctity is a misconception. They are put up simply for purposes of ornament."

Nature has been lavish in her gifts to the Corean lover of gardens, for he may press into his service an extensive quantity of very beautiful flowering shrubs, whilst the flora is rich in very showy examples of the Compositæ, Cruciferæ, and Labiatæ families of plants, and a number of Cacti are indigenous to the Hermit Kingdom. Probably the two features of Corea which will most impress themselves on the visitor, more especially interested in horticulture, are the scraggy and weird Pine-trees (whose one object in life appears to be a desperate endeavour to dispose itself in the most fantastic shapes), and the Chrysanthemum. The latter is here grown to great perfection. The Chrysanthemum festival is one of the most popular of annual celebrations, and those who can afford it cultivate this favourite plant under oiled-paper frames. It is only within recent years that English growers have discovered the great secret of securing the finest flower-heads by growing a single flower on each stem; the Coreans have for centuries practised this system. When the owner of a crop of unusually fine plants, he invites his friends to a feast, in which the display of his Chrysanthemums plays an important part.

Beautiful as is our own spring season, it is a poor affair when compared with that of Corea, where it knows none of the fickleness and uncertainty of our less-favoured clime. The season of the poets begins towards the end of January, or early in February, when it is heralded by the pinkish-white flowers of the Plum-tree, which is followed at intervals as regular as possible by the Cherry-tree, to see which has been truly described as in itself "a sensation;" the Wistaria, the Tree-Pæony, the Iris, and so on, until the summer clothes the country with a new covering; indeed, the whole country is a marvel, which, with the new pro-Japanese constitution which is to be inaugurated in January next, will offer an entirely new field for the scientific enquirer and tourist generally. *W. Roberts.* [The reader interested in Corea may be also referred to the account given by Mr. James H. Veitch of his journey in Corea, as given in our columns in 1893, Nov. 4, p. 556.]

NEW OR NOTEWORTHY PLANTS.

IMHOFIA DUPARQUETIANA, *Baill., in Bull. Linn. Soc., Paris*, p. 1132.

DR. BAILLON, in a part of the *Bulletin of the Linnean Society of Paris*, just received, gives an account of a remarkable new Nerine, collected by Duparquet in the desert Kalihari region of South Africa. It has lorate leaves, which reach 1 foot in length at the time of flowering, a peduncle as thick as a man's little finger, an umbel of about twenty flowers, with pedicels 4 inches long, a perianth 2 inches long, with a very short tube and flat narrow white segments, with a carmine keel; stamens nearly as long as the perianth-segments, and a subglobose ovary, with two ovules in each cell. It has not yet been introduced in a living state, but would be well worth the attention of Messrs. Leichtlin and O'Brien. Dr. Baillon, following Kuntze, calls the genus we know as Nerine by Heister's name, Imhofia. He also describes a new Calliphuria (C. Castelnæana) from the Pampas of Sacramento in Peru, which is nearly allied to C. tenella, Baker, and a very curious Saprophyte Irid (Geosiris aphylla, Baillon) collected by Luntz in the mountains of Madagascar. Its station is near Ampaimadima, in the sandy forests, at an elevation of about 3000 feet above sea level. He has examined the type specimens of Kunth's Hymenocallis Bonplandi, and finds, as I supposed, that is really a Eucharis. It is nearly allied to E. candida, and would be well worth introducing. *J. G. Baker.*

ECHINOPSIS DECAISNEANA.

THIS is one of about thirty species which constitute the genus Echinopsis of some botanists, but which is regarded only as a subgenus of Cereus by others. They possess a good distinctive character in their short, more or less spheroid stems, regular angles, short tufts of spines, and in the exceptional length of their flower-tube. The species figured is a good example of the whole. Out of flower an Echinopsis may be likened to a Melon ridged longitudinally, painted green, with little bosses of spines and wool stuck at regular intervals along the ridges—a plant of totally unattractive aspect. But in flower it is "a horse of another colour." Each flower is six inches across, of the most delicate satiny texture, white, creamy-yellow, yellow, rose, or rosy-red, and deliciously fragrant. In the species here figured the flowers are white. They last only about two days, just long enough to make one appreciate them. I quote what Dr. Lindley said of one of the best-known species, viz., E. Eyriesii:—"Independently of the large size of the flowers, they are remarkable for the rich delicate odour they exhale at night, at which time the glorious blossoms expand. When young, they resemble long sooty-grey horns, covered over with a thick shaggy hairiness, and would never be suspected to conceal a form of the utmost beauty, and a clear and delicate complexion. When the hour of perfection has arrived, and the coarse veil of hair begins to be withdrawn by the expansion of the unfolding petals, one is amazed at the unexpected loveliness which stands revealed in the form of this vegetable star, whose rays are of the softest white."

I do not know any plant which will produce such a large display of blossom in proportion to its size as these Echinopsis will do under suitable conditions. The plant represented in the figure was grown by Mr. Shane, of Vancouver. Growers of Cacti will agree with me that it is scarcely possible for such a specimen to be cultivated in this country. If we could flower Cacti freely, there is little doubt that they would soon become favourites, as the two genera that do flower freely with us, viz., Epiphyllum and Phyllocactus, are already. I know a good collection of Echinopsis which rarely produce blooms. They flowered better last year than usual, but then the summer was a record one. Possibly better results are obtainable by some special kind of treatment than we have got to yet. I read last year an account of some plants of Echinopsis grown in the town of Grimsby which flowered exceptionally well, and which

were grown planted out in the open air from June to October, then lifted, and kept in boxes in a room and kept dry, well-aired, and in a good light till planting-out time came round again. Ten degrees of frost did not hurt them when they were dry. This treatment is simple enough, and the results, as recorded, are far better than anything I have ever seen done under pot-culture. We planted a set of ours out this year, and they have grown very well, and if they flower freely next year after such a sunless summer as we have had, then the Grimsby method will be a big step forward. Probably we coddle our Cacti a great deal more than is good for them. Mr. Cannell and Messrs. Carter & Co. are almost the only English nurserymen who deal in Cacti; but in France, Germany, and the United States there are many nurseries devoted to them. In the catalogues of two French nurserymen, viz, MM. C. Simon and P. Rebut, I find over thirty species of Echinopsis alone offered. Lovers of such plants please take note. *W. W., Kew.*

Fig. 79.—Echinopsis decaisneana. (see p. 624.)

EDWARD LEEDS,

THE RAISER OF THE LEEDS' VARIETIES OF NARCISSUS.

(*Continued from p.* 562.)

Leeds' first plate of his own Longford seedlings was published in 1851, eight years after the date of the Dean's publication. It would occupy all the intervening years to ripen the seeds, to grow the bulbs, and to flower them. The connection is thus evident.

Mr. Leeds' new Narcissi are figured in the *Magazine of Botany*, vol. iii., 1851, p. 1691. The plate contains three fine forms:—1. N. poculiformis elegans; 2. N. Leedsii; 3. N. major superbus. These were the first fruits of his labours in hybridisation. The Editor says:—The fine forms raised by Edward Leeds of St. Ann's, Manchester, a gentleman who has been for many years engaged in cross-breeding this tribe of plants, and who has originated many new and beautiful varieties; and he gives the following account of their origin:—

"The var. poculiformis elegans was obtained from N. poculiformis (montanus) crossed with N. angustifolius (or poeticus). N. Leedsii chiefly differs from incomparabilis in colour of the margin of the lip. It was from major, crossed with poeticus. The latter has communicated to it a deep orange ring. N. major superbus, a seedling from Ajax maxima. There is no end," he adds, "to the varieties and endless forms that may be obtained. . . . The late Dean of Manchester (Dean Herbert) in his papers on this tribe, mentions N. montanus as being difficult to obtain seed from. I have three crops of seedlings from this, crossed with long and short-tubed kinds. It will cross with Ajax of all sorts—with poeticus and angustifolius, and I think with the rush-leaved species. Calathinus never seeds with me, but fertilises the long-tubed species. Bicolor seeds occasionally, but not freely. I have varieties from this with angustifolius, poeticus, and poculiformis, also pumilus; they are all very distinct and curious Moschatus and tortuosus seed pretty freely; they will cross with poeticus, poculiformis, and any of the long-tubed kinds, and the produce is always beautiful. I think much remains to be done in the production of fine hybrids of this beautiful tribe of plants, and it may be mentioned that these are not ephemeral productions, like many modern florists' flowers, but will last for centuries with very little care, as the common kinds have done in our gardens." He then gives the following cultural directions:—"To obtain good varieties, it is needful the previous season to plant out sorts of some of each kind in pots, and to bring them into a greenhouse in spring, to flower, so as to obtain pollen of the late-flowering kinds, to cross with those which otherwise would have passed away before these were in flower. With me the plants always seed best in the open ground. When the seed-vessels begin to swell, the flower-stems should be carefully tied up and watched until the seeds turn black. I do not wait until the seed-vessel bursts, as many seeds in that case fall to the ground and are lost, but take them off when mature, with a portion of the stem, which I insert in the earth in a seed-pot or pan provided for their reception. I place them in a north aspect, and the seeds in due season are shed, as it were naturally, into the pot of earth. I allow the seeds to harden naturally for a month on the surface before covering them with half-an-inch depth of sandy-soil. The soil should be two-thirds pure loam, and one-third sharp sand, the drainage composed of rough turfy-soil. In October I plunge the seed-pots in a cold frame facing south, and the young plants begin to appear in December and throughout the winter, according to their kinds and the mildness of the weather. It is needful in their earlier stages to look well after slugs and snails. The seedlings should be protected from frosts, but should have abundance of air. . . . When the bulbs are two years old, prepare, in an open airy situation, a bed of good loam, mixed with sharp sand, in which the bulbs should be imbedded; plant the roots in rows, 3 inches apart. . . . They will stand three years in this bed. A few will flower the fifth year, but the greater portion not until the seventh."

In the same volume, p. 289, is a second plate, containing, 1, N. aureo-tinctus; 2, N. incomparabilis expansus; 3, N. bicolor maximus; and of these the last continues to hold its own against all comers, as the most symmetrical and perfect in form and colour of all the Daffodils.

In this careful way did Leeds proceed with his work, and these six varieties were, I believe, all that were published to the world in his lifetime. They were the beginning of a great series, and the full fruition is only now appearing.

Mr. Barr corresponded with Leeds from 1868 to 1874 on Daffodils, and during the whole time he knew that the seedlings were for sale, and did his best to find buyers; but, as in the case of his Crocus Leedsii, his efforts were a failure. At last it came to Mr. Barr's ears that Leeds had made a will, and provided, in the event of the Narcissi not being sold while he lived, they were to be destroyed at his death, and knowing that he had many fine seedlings, he made a grand effort, and became the possessor of all the Narcissi under name and number, viz., 24,223 bulbs, besides a lot of small ones, not yet flowered. Mr. Barr thus rescued from destruction as fine a lot of garden treasures as these Islands possess, and as fine a result of hybridisation as is on record. Whether Mr. Leeds fully realised the greatness of his work, Mr. Barr cannot say, but he remarks in one of his letters to me, in speaking of Leeds and Backhouse of Wolsingham: "I could be eloquent on the work of these two men, as day after day, and year after year, I followed their work step by step, and how one thing came out of another, till the work of these men came to be part and parcel of myself. Edward Leeds was indeed a great man, and I hope you will do him the fullest justice."

In Barr's supplementary catalogue of the Daffodil Conference of 1884, an extraordinary number of the Narcissi are marked with the letter L, which indicates that they were raised by Edward Leeds. They may be summed up as follows: Ajax or trumpet group 32, bicolors 12, lorifolius 2, moschatus 3, incomparabilis 65, Barri 7, Leedsii 21, Humei 4, Nelsoni 6, or a total of 152 varieties, all presumably excellent and distinct. Not only are they numerous, but they are of great merit. Space will only admit of a few examples: In the Ajax group, we find John Nelson, one of the finest deep yellow trumpet Daffodils; Captain Nelson, Hudibras, Her Majesty, Volutus, a very beautiful sort now called J. G. Baker, and Major superbus, figured during Mr. Leeds' lifetime. In the bicolor group, bicolor maximus, now called grandis, also figured in his lifetime, the most symmetrical of all the Daffodils, the perianth containing two perfect triangles of purest white, and with a very fine and richly-coloured tube; Albidus, Prof. M. Foster, Dean Herbert, and W. Robinson. In the moschatus group we have cernuus pulcher, Marchioness of Lorne, and Wm. Goldring; and when we came to the incomparabilis group, we find our favourites, Frank Miles, Edward Hart, Leedsii, Princess Mary, Harpur Crewe, sulphureus, splendens, and many others. There are also gems in the Barri and Humei groups. The Leedsiis are all his own, and the curious Nelsonis, with the tube of Macleayi.

Many of these varieties Mr. Leeds never saw in bloom, and but for Mr. Barr we should not have possessed them. They remain a joy to us all, and a monument to the raiser and to Mr. Barr, who has so successfully continued and completed his work.

Mr. Leeds' Garden at Longford Bridge.

After the publication of Dean Herbert's note, Mr. Leeds rummaged Europe for Narcissi for his garden. Every nurseryman's catalogue was looked over, and every variety obtained that he could hear of. Mr. Glover was a frequent visitor at Longford, and familiar with all his proceedings. He was frequently with him when busy with his Narcissi, and recollected the beds where they were grown, and the methods followed by Mr. Leeds. He had many of the Trumpet varieties, tazettas, poeticus, corbularia, biflora, incomparabilis and poculiformis. Mr. Glover frequently saw him crossing them with pollen, the later sorts being raised in pots under glass so as to have them in bloom when the earlier sorts were in flower at their natural time of blooming. He used to remove the stamens the moment they appeared, and then wait until the pistil was ripe, when the pollen was applied. The petals were then tied with matting, and thus the bees were prevented from interfering with the fructification. He remembered several beds of seedlings with hundreds of varieties, and Mr. Leeds was never tired of descanting on their beauties. He attended to them himself, and never allowed anybody else to touch them.

Mr. Findlay, who is the present curator of the Manchester Botanical Gardens, remembers Mr. Leeds very well in later life, and describes him as an enthusiastic botanist who devoted much time to the hybridisation of Daffodils. He was much annoyed, and reasonably so, at the want of appreciation on the part of the floricultural world for his seedling Daffodils, and told Mr. Findlay that he had almost made up his mind to dig a hole and bury the bulbs out of sight. Mr. Findlay says that Leeds had a deep, glowing childlike enthusiasm for nature as set forth in the vegetable world. He always thought him destitute of malice or guile; firm in his attachments; in short, the "fine fat fellow that he was." At the time Leeds commenced his Narcissi culture, Mr. Ashton was his gardener; he was followed by Mr. Hilton, who was with him three or four years, and was succeeded by Mr. Hollingworth, who remained with him until his decease. Hollingworth says the seed latterly was not always gathered, and when gathered it was not always sown, as he became indifferent to the subject. He used to say when he crossed any flowers, that they would come in for someone else. He noted the crosses when made on a slip of paper and put it in his pocket. For the last five years he was quite an invalid. He had then a large collection of florist Tulips, and when they were in bloom and he unable to walk, he would sit in his bathchair by the beds on sunny days and admire them, saying it was the finest sight in creation. He died in 1877, and was buried in Bowdon churchyard. He left word that all his papers, seeds, &c., were to be destroyed, which was done by his widow.

I first became acquainted with Mr. Leeds' garden shortly after his death. A friend told me of a beautiful Crocus (Leedsii) which he had obtained from an old garden at Longford Bridge. I had then become aware of the Leedsii Daffodils, but not of their origin, and when I found that Leeds of Longford was the great florist who had raised them, I was not long in seeking out the place. It was on the turnpike road from Manchester to Altrincham, near the river Mersey, on flat alluvial soil, I found a plain roomy cottage, with extensive outbuildings, quite hidden from view from the road by huge overgrown Rhododendrons, Box, and Laurels, 15 to 20 feet high. I found Mr. Leeds' old gardener, Hollingworth, in possession of the place—Mrs. Leeds having removed to London. It was early spring, and the garden was ablaze with Daffodils—growing by thousands, almost wild. One could still trace the old beds, and Hollingworth had a few special beds of choice sorts which he had for sale. There were huge Pæonies, many lovely varieties of Scillas nutans and S. campanulata, of every shade of blue, lilac, pink, and white, the results of Mr. Leeds' careful crossing. In the rear of the cottage were some greenhouses, and brickwork pits filled with small pots of Alpines, which had overgrown the place, making mats of Sedums and Saxifrages. In the greenhouse was a large lot of seedling Amaryllis, which had been carefully crossed. The rockeries were built up of brick, tier upon tier. There were four of them, each 100 feet long, about 10 feet broad, and 4 feet high, the spaces between the bricks were filled with Alpines and hardy plants, and now covered with rank overgrowth. At one place the Veronicas had prevailed, at another the Saxifrages had gained the ascendency. There were large clumps of the most beautiful Orobus vernus I had ever seen. Hardy Geraniums had grown into huge masses, and Fumarias formed lovely purple bosses. Of the smaller Irises, there were large clumps. Creeping plants had trailed over the walks, and in the borders were thickets of huge growers. Telekias, Asters, Campanulas, Delphiniums, Veratrums, Heracleums, and other giants, in rank profusion, the fittest only having survived. On closer inspection the rockeries were found to contain choice treasures, hidden away amongst the overgrowth, and these were carefully marked down when in bloom, and removed when the proper time came. Such was the place when I first saw it, and I always considered it a fortunate thing that I was thus accidentally led to it. For months I carefully noted and removed the choice plants and Narcissi to Brockhurst, where they now abound and constantly remind me of Leeds of Longford.

In May, 1883, I visited it for the last time. The scene had changed. The old garden had gone. All the Rhododendrons and Laurels were cut down. The cottage was newly-painted, and had a new tenant without a soul for flowers. The garden was being trenched for Potatos, and a surveyor was at work with poles and chain laying out the land in building plots! *Wm. Brockbank, Brockhurst, Didsbury*, 1894.

THE GATHERING AND PACKING OF ORANGE AND LEMON CROPS IN SICILY.

The following notes on the gathering and packing of the Orange and Lemon crops in Sicily, are from a recent report to the Foreign Office on the trade of Palermo. The produce and exportation of these fruits, besides being a most important item of external trade to Sicily, has, it is said, also from the numerous foreign markets to which they are sent, challenged the attention of foreign exporters and producers, owing to the intrinsic good quality of the fruits, and the success attained in their preservation during the longest voyages. Many enquiries have been made in Sicily on this subject, and information obtained on the best and most advantageous mode of packing. Indeed, it is stated that the practical knowledge of the Sicilians as to the most suitable method of gathering and packing Oranges and Lemons has often been recognised, and they have been occasionally hired for the purpose in Greece. The proper season for picking Lemons depends mainly on their destination, and on the degree of irrigation. Thus the first crop is gathered towards the commencement of October, on those plantations which are suitably and plentifully watered. The limit of weight as fixed by experience, and under which the fruit is not considered ready, is 3½ oz. The October fruit is exported forthwith, as it cannot be kept for further maturation. The second crop is picked in November, and comprises fruit which can be preserved for the most part up to April, until then it is usually stored in special warehouses and then sorted carefully. The third picking takes place in December in the same manner, and under the same conditions as that of November. The two last crops are gathered in January and February, and are forthwith shipped, for the fruit under these two gatherings cannot be preserved for any length of time.

The fruit, in whatever season collected, ought never to be under weight, namely, under 3½ oz., and should be carefully packed in cases made of beech or other light wood of a similar kind, divided into two equal parts by a partition and of various sizes; those containing from 300 to 360 Lemons each are the smallest, and are mostly destined for the United States, Hamburgh, and Trieste; those containing from 400 to 420 Lemons are shipped for French ports; and finally, those containing between 420 and 490 to the United Kingdom. In all cases the Lemons should be properly wrapped in tissue-paper, and the fruit most carefully sorted previously; the mouldy or otherwise damaged fruit set aside, and the pedicle cut off, but not torn away.

These remarks apply generally to the gathering, sorting, and packing of Oranges. With respect, however, to the proper season for picking, it must be observed that the Orange-trees growing on the same site are gathered at once and not in successive pickings. The suitable time depends again on the locality, and varies with the height above the sea-level on which the trees have been grown. Thus the fruit in the lowlands is ripe for use in the month of November, that on the uplands in December and January, and finally, that on the mountains matures between February and April. The cases in which the fruit is laid contain each from 160 to 300 Oranges, and are shipped to all parts of the world, and almost always reach their destination in a good state of preservation.

Orchid Notes and Gleanings.

CATTLEYA LABIATA.

In the Orchid collection of F. Hardy, Esq., Tyntesfield, Ashton-on-Mersey, there is, at the present time, a single specimen of a fine variety of this species carrying more than one hundred expanded blooms. Such a plant flowering at this season may well compete with any stove or greenhouse plant for showiness and the lasting qualities of its flowers.

Erlscliffe, Bowdon, Cheshire.

Visiting Mr. G. S. Ball's garden on the 6th inst., I was struck with the collection of Orchids which is being got together by him. Amongst the many well-grown plants seen on entering one of the houses was a goodly collection of various Orchids, on the front stage there being a remarkably healthy lot of Odontoglossums, many of them throwing up some fine flower-spikes; amongst others, O. crispum, O. Andersonianum var. maculatum, with two very strong much-branched spikes; O. Pescatorei, O. cirrosum, in good health. Hanging from the roof were some fine panfuls of Sophronitis grandiflora, the plants just beginning to flower; Lælia præstans also in hanging baskets was doing well; plants of Masdevallia bella, and M. Chimæra, were observed in robust health, carrying numerous flowers. When cultivated in this way, these species are very effective objects. On the back stage were seen some half-dozen plants of Masdevallia tovarensis, grand examples of good cultivation; these are growing in 6-inch pots, and have about fifty flower-spikes on each, which in the course of a few days would be a mass of fully-expanded blossoms. In the same house some dozen plants of Cypripedium insigne were observed, of great vigour, and each furnished with from twelve to twenty flowers, no two varieties being alike. Odontoglossum Rossi majus was likewise noted in very floriferous examples. Another favourite Orchid is Trichosma suavis, two fine healthy plants of which were in flower, scenting the entire house in which they stood.

One house contains a mixed collection, the Cattleyas being the principal objects therein; and of C. labiata vera there are some twenty or thirty plants in flower, two being especially noticeable for fine colour, and breadth of the sepal and petals, and the size of the lip. It may well be doubted if any variety is existing finer than these two. Vanda cœrulea was remarked to be very fine, both in size of flower and in colour; this plant has been in flower for six weeks. Lycaste Skinneri alba, a very fine variety, was carrying two flowers; Pleione lagenaria possesses very large pseudobulbs, and on one pan, measuring 12 inches in diameter, filled with

these, 112 open flowers were counted. Plants of Calanthe Veitchii are just beginning to open their first flowers; one plant of Oncidium tigrinum, with many-branched spikes of violet-scented flowers, numbered ninety-two of them open. Cypripedium insigne album, C. i. aureum, C. i. Chantini, C. i. giganteum, are four very distinct varieties that were noted in bloom; also Dendrobium formosum giganteum, with two fine clusters.

One house is devoted to the cultivation of a collection of Ferns, and hanging from the roof I noticed half-a-dozen well-grown Lælia anceps, L. a. Percivalliana, L. a. Dawsoni, with a fine lot of spikes. In the conservatory were some capital Chrysanthemums.

I was taken round the lawn and flower garden by the gardener, Mr. Hay, and noted how well the garden is laid out and kept up. A good lot of shrubs are planted round about the house. In the course of our walk we came to another range of Orchid-houses, filled with well-grown plants of Cypripediums, including C. insigne Sanderæ, with one extra fine flower. The plant was purchased from Messrs. F. Sander eighteen months ago, with only one growth, and it now has six strong growths. *W. H.*

Cattleya labiata Foleyana

is, like all the others of this type, an evergreen Orchid, the pseudobulbs or stems averaging from 6 to 10 inches in height; it produces a rhizome which is about as thick as the little finger. During the young state these pseudobulbs are invested by a greyish membranous sheath, which drops off as they become older, leaving them bare; they then gradually become furrowed. The coriaceous dark green leaves are borne on the tops of these bulbs singly, and often last on the plants for several years; from between these arises a compressed double sheath, which in the darker forms is usually tinted with purple, but in this variety it is whitish-green. The flowers are borne sometimes in pairs, and as many as five have appeared on one spike, which make a very beautiful spectacle. The sepals and petals are of the purest white, the latter very broad, and of fine form, being beautifully undulated; the lip is also of the purest white, excepting the deep orange-yellow stain in the throat, and a small rosy blotch in front of this latter; the margin is nicely crisped and fringed, the whole flower measuring quite 8½ inches in diameter. We have no doubt this is the finest white variety of C. labiata that has yet flowered, and it has been greatly admired by all who have seen it. This variety will succeed best with either basket or pot culture, in a nice compost consisting of good brown peat fibre and sphagnum moss, which should have good drainage. During the growing season, which is the spring and summer months, a liberal supply of water will be necessary; but after the growths are mature, sufficient just to keep the plants in a plump and healthy condition will be all that is required. This plant is specially valuable on account of the season in which it opens its lovely flowers, which is during October and November, when Orchid blooms are exceedingly scarce, more especially white ones. *Orchid Album*, vol. xi., part 125.

Broughtonia sanguinea

is well deserving a place in every collection, on account of the brilliant and distinct colours of its flowers, which last a long time in full beauty if they are not sprinkled with water from the syringe. If given the proper treatment, this plant is very easy to grow. We find it succeeds best when placed on a wooden block, with a very small quantity of sphagnum-moss around its roots, only just sufficient to keep it moist being necessary; it should then be placed in a light position close to the glass, where it can obtain plenty of sunshine, which is very essential to induce it to bloom freely. It requires an occasional dipping in water, and the syringe should be used often, which will also keep the atmosphere in a nice moist condition. As this is a native of the tropics, it is only natural that it must have plenty of heat under cultivation; it should, therefore, be grown at the warm end of the Cattleya-house, or among the East Indian Orchids. *Orchid Album*, vol. xi., part 125.

The Bulb Garden.

PLANTING BULBOUS IRIS.

The beautiful and varied forms of the bulbous Irises that flower during June and July, should be planted without delay. In their great beauty they vie with the more costly Orchids, while in their perfect hardiness and easy culture in the majority of soils they come within the reach of all who have a garden no matter how small. Both the English and Spanish groups are indispensable if it is wished to secure a long succession of bloom. The earliest to bloom are the Spanish kinds, botanically known as I. Xiphium, and for purposes of cutting these are the more largely grown. They include some very chaste and beautiful varieties. That known as Gold Cup or Thunderbolt has enjoyed an extensive popularity. This is also known as the Clouded Iris, on account of the quaint mixture of bronze and gold in the flowers. Others there are with clear yellow flowers, such as William the First, which is one of the best of the yellows, while La Vestale and Queen Victoria are two of the purest white, both rather dwarf, and each of them beautiful. Apart from these there are light and dark blues, purple, dark brown, and bronze, as well as those of porcelain and pearl.

The so-called English Irises, I. xiphioides, or I. Xiphium latifolium, are somewhat dwarfer in habit, and flower fully a fortnight later. In these are included some exceedingly rich shades, pure white, pink, rose, lilac, violet, puce, purple, with maroon, and others nearly black; whilst some are spotted, splashed, or marbled. The flowers of this section are larger than in the first-named group, and the succession they afford alone makes them welcome in our gardens as prolonging the flowering season of one of the most lovely races of hardy plants. In the matter of culture they are easily suited. Select a warm sunny position and a well-drained soil, fairly rich, or if manure has to be added at the time of planting it should be thoroughly decomposed, and be dug in four or six inches below the bulbs. This is an easy matter if beds are being planted, by placing a layer of manure in the trench below the planting level. Where heavy soils exist, leaf-mould and sharp sandy grit may be added freely, and the bulbs may be surrounded with similar material. Plant the bulbs at a depth of 4 or 5 inches, and let this be done at once, as even at the present time roots are being emitted by some of the early kinds in the dry state. Where this happens the bulbs can only be kept dormant by a distinct loss in vigour. *J.*

Fruit Notes.

PEARS.

Mr. Coomber's note on Pears will have been perused with interest by many of your readers, as it shows how sometimes a really good variety is declared to be worthless, when the fault lies in the coldness of the soil, and perhaps a rather sunless season. It shows also the importance of keeping the roots near the surface instead of allowing them to go downwards. Mr. Coomber also remarks on heavy cropping being a cause of poor flavour. I have found this to be the cause here of deficiency of flavour in Pears. The same is noticed in Peaches, &c., when the crop is excessive. I do not know that I ever remember the fruits dropping so much as was the case in my neighbourhood this year, and this occurred long before the fruits were ready for gathering; and the Pears dropped off in some instances to the extent of three-fourths of the original crop, the worst being Beurré Rance, Glout Morçeau, Vicar of Winkfield, Madame Treyve, Alexander Lambert, and Autumn Nelis. Last year our best Christmas Pear was Glout Morçeau, and the fruits kept well, and were clear in the skin, the flesh melting and sweet more like a well-grown Marie Louise; this season, however, Glout Morçeau is very scabby and much inferior. The best Pears this year were Williams' Bon Chrétien, the usual form and the striped variety which keeps longer than the types; Marie Louise, which was very fine and kept well; Triomphe de Vienne, a Pear not nearly as much grown as it should be, as a standard, it is one of our best Pears and a regular cropper; Emile d'Heyst is another excellent Pear, cropping heavily as a standard and espaliers, an excellent Pear. An excellent Pear is Durondeau, which keeps well, has very white melting flesh; Louise Bonne of Jersey was also very good, and the colour was equal to that of last year. Beurré de Amanlis was very satisfactory. Beurré Superfin, Winter Nelis, Pitmaston Duchess, and Beurré Diel were better this year than last—in fact, B. Diel was better than I have known it to be. It is never first rate, it being too gritty. Before gathering any variety of Pear I always cut a few, and if the flesh is rather juicy and sweet I gather them, when, as a rule, they ripen perfectly. Now that the pruning is being pushed on with, I would like to mention, although I am a great advocate for close pruning and keeping the flower-buds as close to the main branches (on walls and espaliers), that there are some Pears, of which the Jargonelle is an example, which bear on long spurs, and it is from the terminal buds on these that the finest fruits are produced. The pruner should bear this in mind, and preserve as many of these long spurs as may be convenient. Some amount of shortening back may be done annually, if only the very longest are selected for this operation. *H. Markham, Mereworth Castle.*

Washington Apple.

This variety was shown some years ago by Mr. Bunyard of Maidstone before the Royal Horticultural Society. It has a good appearance and shape, large size, and bright colour, with a melting flesh and delicious perfume. If my memory serves me right, Mr. Bunyard's fruits were from trees in an orchard-house, and none that I have seen since that time has equalled them. What I should like to know is, which districts this variety does best in, and if the tree is free from canker. It may be that it, like several others, are best suited to orchard-house or wall-culture, but I have no experience of this. *A. Evans, Lythe Hill.*

A TRAVELLERS' NOTES.

(*Continued from p.* 598.)

New Zealand, *June* 26, 1893.—From Napier to Taupo, situated on a lake of the same name, the largest in New Zealand (15 miles by 25 miles), is a two-day coach journey, the night being passed at Tarawera, forty-four miles from the journey's end. The way four strong horses swing the featherweight carriage round the sharpest curves on the hill-sides, often overhanging precipices of several hundred, and even thousand, feet, on a 10-feet road, without any railing or protection of any kind, is apt to be trying. So sharp are the curves, that often the front pair are nearly parallel with the coach. The roads are in bad condition, and frequently very heavy, owing to much rain.

At first a few stations are passed, and innumerable sheep grazing quietly. Along the side of the road Bramble and Briar have obtained the dignity of weeds, though they are scarcely so much feared as Gorse, which all are bound by law to prevent spreading into the public road, or, indeed, off their own property under the penalty of a fine.

Cordyline australis is not uncommon, its light, graceful foliage giving a distinct aspect to the landscape. I have not noted it more than 25 to 30 feet high, though Mr. Kirk has met with it in the King-county 60 feet, and Mr. Colenso mentions one 20 feet 2 inches in girth at the base. The simple straight stems of the young unflowered plants, crowned with one head of foliage 1½ to 2 feet long, look at first very different from the many-branched, round-headed tree, with the smaller crowns characteristic of older specimens. Phormium tenax is most common, dwarfing to more than half its normal size as the higher elevations are reached. Veronica

salicifolia, seeding freely, assumes the dimensions of a large bush; it is found more or less in all parts, and although most common in the lowlands, it is found on the hill-sides. During the journey many ranges are crossed (from the summits of which fine views are obtained), many valleys traversed and mountain streams forded—where it has not been found necessary to make a bridge. Two or three Maori pahs or villages can scarcely be called interesting. The men wear corduroys, the women, in European costume, invariably ride horses straddle-leg.

The land generally, for the 89 miles passed through, is poor—in fact, much of it is quite valueless. Between, however, Tarawera and Runanga is some very fine bush. The prevailing trees are those mentioned in my last letter—Podocarpus dacrydioides and Dacrydium cupressinum. One fine belt I noted, running at a distance of some miles from the road, and parallel with it along the summit of a low undulating range—a line of sombre, heavy hue. Totara (Podocarpus Totara), the next most valuable wood in New Zealand to the Kauri (Agathis australis [Dammara australis]), and of which I shall have something to say when I meet with it in greater quantity further north. Here it is but sparsely represented, nearly all having been cut out. Lomarias, Polybichums, and Gleichenias, are common and in wonderful luxuriance, whilst up the long narrow gulleys all the well-known filmy Ferns are said to be met with. I saw but three Cordyline indivisa—a very fine thing. I hope to meet with more and better specimens.

The shrubbery over the stretch of road indicated, is rich and varied. Makomako, or Wine-berry —Aristotelia racemosa—a tall spreading shrub, has almost a monopoly in one place. Pittosporums are not uncommon, and what I took be Grislinia lucida is occasionally met with.

Most curious-looking, however, of all, is the Horoeka, Pseudopanax crassifolium, also known as Aralia heterophylla and Xylophylla longifolia. The narrow deflexed leaves of the young specimens 2 to 3 feet long, scarcely exceeding ½ inch in width, on a stem often several feet in height, give place in later stages to compound foliage, with three to five leaflets; the margins are sharply toothed, and the colour and general aspect so distinct that Mr. Kirk rightly observes, "It is one of the first trees to attract the attention of the traveller in forest districts."

Bracken Fern, a form of Pteris aquilina, one of the commonest of the world's plants, covers many acres on hill-sides, growing with great vigour, to the exclusion of all else. Beyond Runanga the pumice and lava country is reached, poor land, apparently supporting nought but wild horses. For many miles we drove through a dense growth of Manuka (Leptospermum scoparium), described as "the most common plant in the colony." It covers hundreds of acres, ranging from ½ foot to 30 feet in height, and is said to be very effective from November to January, when it flowers in great profusion; at present the acres of peculiar grey-green is apt to weary the eye.

The Geyser Country.

At Taupo is a good hotel, provided for the tourist season, when it is full to overflowing, this place being the first spot in the great thermal spring country.

The thermal spring district of the north island covers some 1000 square miles. Respecting the safety of residing within its limits, it is considered comparatively safe now, owing to the immense relief afforded by the eruption of 1886. During our time another such convulsion can scarcely be expected.

The scene of the eruption, Mount Tarawera, was but a few miles from where I am now writing (Rotorna). Here a lake disappeared, and the whole face of the country was altered, much being now under 30 to 40 feet of mud. New Zealand's most famous sights, the pink and white terraces, were destroyed. One may still remain, being only covered up, but so altered is the aspect of the land, that it is impossible to fix its site and undertake clearing operations.

The silica incrustations surrounding the boiling pools are often very lovely—quite hard, and of course of great age. Of such were the famous terraces now destroyed. In these hot pools (all are not up to boiling point), the natives, especially the children, bathe all day. As a rule, they are a fine race, but western civilisation is having the usual effect, as its worst aspects only are copied. They are decreasing in numbers, and ultimate extermination seems to be only a matter of time.

I have visited many of the natural vents—those at Wairaki, Wai-a-taupo, Taupo, and Whakarewarewa. These consist of mud volcanoes, alum cliffs, boiling mud ports, boiling springs, sulphur fumaroles, all active, and betokening a subterranean movement and condensed force almost incredible.

Many of the geysers are very fine, and spout at regular intervals, all emitting dense volumes of steam visible for miles round. The best I have seen reach from 30 to 40 feet.

Near the various hotels are baths, alum, sulphur, &c., cold water being laid on to cool that flowing in from the boiling pools. On myself and on many others, these have a weakening effect, though their curative properties are undoubted. It is, however, necessary to have a complaint. I have, happily, not one on hand at the moment.

The country in this district over which I have travelled in coaches some few hundred miles is very poor, the cause being that the volcanoes have not and do not eject lava as in Java, Japan, &c., but pumice —roughly described as a mixture of earth and stone. Forests are almost unknown, all the hills being covered with Bracken growing in profusion. From twenty to thirty miles one goes without seeing a habitation, only meeting a man repairing the road, or a few wild horses.

Large as is the tourist traffic in summer, it is probable railways will never come through the heart of the north island, as they alone could not provide a reasonable return. The roads are bad, and one gets well shaken up in the so-called coaches, in reality little more than buggies.

It is difficult to enjoy this district at this season and during the almost continuous rain we are having.

Of vegetation there is nothing to see, so poor is the land; it will support nothing but Fern and some Flax in the swamps. Native brown-grass grows in strong tufts, but is poor feeding for any but wild horses, or those doing no work.

The tourist accommodation is by no means up to that in Japan. As there, in the season, two and three sleep in a room—or, indeed, anywhere where they can get a roof; whilst the steamers to and fro to Australia have their decks covered. All that inconvenience is escaped at this season. On two occasions I have had the whole hotel to myself, and at present there are but three others here. One is rather too lonely, in fact, and the weather is too bad for anything.

Common plants in the scrub, and especially noticeable in the vicinity of Rotona, are the Mingi, Cyathodes acerosa, and the Tutu (Coriaria ruscifolia). In this district, the former is a dwarf, neat shrub, bearing at this season numerous spherical pink or white fruit, attractive in appearance. The latter attains considerably larger dimensions, and is common on the outskirts of the bush. Its long pendulous racemes of fruit, and deeply venated, almost sessile, opposite leaves on young shoots, many feet in length, are very handsome. Its chief interest, however, centres in its poisonous properties, respecting which Mr. Kirk gives much information in his *Forest Flora*.

From Rotura to Okoroire, from whence the train may be taken to Auckland, the largest city in the colony, is a distance of 30 miles, crossing a range of mountains, attaining at the highest point 2020 feet. The roads, if such they may be called, for in reality they are little more than a clearing, are bad; for miles hidden by a slough of 6 to 12 inches of semi-liquid mud. For the first 10 miles the country is open, soil poor, and almost valueless, covered with Bracken and Manuka (Leptospermum scoparium).

For the second stage of 10 miles the bush is very rich, fine, and varied.

Ferns are in glorious profusion, Lomarias, Nephrolepis, Hymenophyllums, &c. Tree Ferns are most numerous, often rising 15 to 20, and not infrequently to 30 feet. Cyathea medullaris is magnificent, but not common, its immense fronds covering an area of many yards.

Large forest trees are represented by the Rium, Dacrydium cupressinum; White Pine, Podocarpus dacrydioides, and an occasional Matai, Podocarpus spicata. Of the first two I have written, the last named is equal in appearance and of almost equal utility. Good specimens attain a height of 60 to 80 feet, round-headed, and of that dusky green peculiar to New Zealand forests when viewed from a distance. As fine a sight as one can well wish to see are the thickly-wooded gullies and hill slopes passed in this route. Dark massive White Pine and Matai relieved by the weeping yellowish-green Rium, spreading in one broad band, sometimes for miles along steep slopes, a sight obtained to perfection from the winding road skirting the hill on the opposite side of the deep broad gullies.

The wood of Matai is said to be of considerable economic value, and easily worked. Its durability especially from hilly districts, is remarkable.

The Kohutuhutiu (Fuchsia excorticata) is freely met with at an elevation of 2000 feet, and Tawa, Beilschmiedia Tawa, is common. This is a handsome evergreen, with narrow, oblong, thickly-set, glossy, rich green foliage. Mr. Kirk gives its extreme height at 10 feet, and states that it constitutes the greater portion of the forests in many northern districts. In the bush in question this, however, is not the case, and I met with no specimens approaching the height named; as I only saw the margins, this is not to be wondered at.

In portions, the undergrowth consisted almost entirely of the Mako-Mako, or Wineberry, Aristotelia racemosa, a fine shrub, but now somewhat bereft of leaves; added to this, the branches are distant, spreading, and slender, appearing somewhat bare at this season. The large acuminate foliage is of an exceptionally deep glossy tinge.

As handsome a tree as I have yet met with is freely represented on the confines of the bush; the native name is the Rewarewa, often termed Honeysuckle by settlers; to science it is known as Knightia excelsa. It is tall, erect, and rigid, with broad, blunt, stiff foliage, 6 to 8 inches long, added to a fastigiate habit; it attracts immediate notice when first seen; its racemes are said to consist of from fifty to eighty flowers, each about 1½ inch long; these, unfortunately, are not to be seen at this season, but their size and beauty, added to a tree of such unique appearance in New Zealand forests, it need scarcely be said, renders this, when it attains its extreme height of 80 to 100 feet, an exceptional object altogether.

For the first time, I have met with good specimens of that extraordinary plant, the Raba, Metrosideros robusta, one of the largest trees of the New Zealand flora. I have seen specimens at least 100 ft. high. The prevalent notion amongst bushmen and settlers is, that the Raba climbs trees, encircles them, and in course of time squeezes them to death; a most probable conclusion for a casual observer to draw—needless to say it is entirely erroneous. The seeds germinate in the forks of lofty trees, Rium, White Pine, &c., especially in the decaying leaves of the epiphyte Astelia (already referred to). When quite young, it sends forth aërial roots, slight and feeble; these gradually reach the soil below, and in course of time the once threadlike aërial root assumes the appearance and the properties of a stem. From this, usually lying flat against the supporting trunk of the tree in which the individual has made its home, horizontal, lateral roots are given off, encircling the trunk entirely. As this process is repeated to an indefinite extent, in addition to main roots being frequently connected by oblique laterals, it is easy to conceive the death of the enclosed trunk is but a matter of time. Inosculation, resulting in an uneven, rugged cylinder, in diameter many feet, follows. Mr. Kirk states a solid stem is never formed as commonly supposed, and adds that on one tree, and one tree only, viz., Vitex littoralis, it can make no impression, the iron-grain of this tree forcing the root-stems of the epiphyte apart, and sometimes dislodging it.

In addition to its magnificent flowers, described as most glittering in effect, and its peculiarity of growth, the wood has proved of extraordinary durability and toughness, and suitable for bridges and other works requiring those properties it excels in. It forms large round-headed trees; occasionally in the centre and top of the skeleton of the unfortunate individual to which it owes its existence, may be espied rising gaunt and naked, the huge cylinder of inosculated roots enclosing entirely the lower portion for a height 60 to 80 feet. From numerous specimens it is easy to trace this curious phenomenon in its various stages, a sight of exceeding interest.

James H. Veitch.

(To be continued.)

Trees and Shrubs.

AUCUBA JAPONICA VERA.

As an illustration of the fine appearance which Aucuba japonica var. macrophylla attains in a moist shady season like the present, we enclose you a leaf, which, as you will see, measures in its blade 10 inches in length by 4¾ inches in width, fully entitling it to the character of one of our finest evergreen shrubs.

Whilst writing, we may mention that few planters appear to be aware of the value of Aucuba japonica vera as a hardy evergreen. It is certainly hardier than the common variegated Aucuba, and for planting in the vicinity of towns, it is one of the best evergreens that can be used, resisting both smoke and dust remarkably well. *J. Backhouse & Son.*

[The blade of the leaf sent by our correspondent was 10 inches long, stalk 1½ inch. Ed.]

Berberidopsis corallina,

This handsome evergreen climbing shrub is rarely seen outside a nursery or botanic garden. By some it is recommended to be planted at the foot of a south wall, but by so doing I failed twice. In my opinion such a situation is too hot for the free growth of the plant during the summer, or even in spring should a spell of warm dry weather set in. Some succeed with it in a cool greenhouse, but here in the south of England no trouble need be experienced i an eastern aspect is selected, and some care exercised in planting. Soil naturally of a peaty character, or sandy loam, would grow this plant without any trouble. In my case, where the soil is both heavy and much impregnated with chalk, it is useless to attempt to grow plants of the character of this subject. I dug out a hole 18 inches square, put in at the bottom a layer of clinkers as drainage, and filled up the remaining space with peat and partly-decayed leaves, with a liberal admixture of sharp silver-sand. Abundance of water should be afforded during dry weather in the early summer, when growth is being made, as upon doing this depends the quantity of blossoms that will be produced by the current season's shoots. It may not be generally known that blossoms are produced as freely from the present year's growth as from that of last season. The latter commences to bear flowers in June, and continues for some time, the newer growths producing abundant blossoms in August.

If the situation is exposed to east winds during February or March, a little protection while the plants are young, in the form of a temporary light stood against the wall to break the full force of the wind, will prevent many of the leaves falling off, thus rendering the stems bare for a time. *E. M.*

[Some half-a-dozen plants would form a pretty bed on the turf in south country gardens. Ed.]

Fig. 80.—EPI-LÆLIA × HARDYANA.

Abelia rupestris.

According to Mr. Nicholson in his *Dictionary of Gardening*, this deciduous shrub was named after Dr. Clarke Abel, physician to Lord Amherst's Embassy to China in 1817. Here, in south Hants, it is perfectly hardy, planted against a south wall, not requiring the slightest kind of protection, the plant having stood out for the last eight years or more. It is a shrub not often met with, but still a very desirable one for any garden. The small, pink-coloured, sweet-scented, bell-like flowers, are freely produced in pairs at the end of the shoots during September; the reddish-coloured sepals are of a leafy texture. Like many other plants from China, it luxuriates in a peaty soil, and likes an abundance of water during growth, growing then vigorously, and producing a profusion of bloom. *E. M.*

EPI-LÆLIA × HARDYANA.

(LÆLIA ANCEPS ♀, EPIDENDRUM CILIARE ♂.)

This extraordinary bigeneric hybrid, which many lovers of Orchids have, during its progress to maturity, watched with keen interest in the establishment of Messrs. F. Sander & Co., St. Albans, was recently flowered by that firm, and exhibited at the meeting of the Orchid Committee of the Royal Horticultural Society on November 13, when it was given an Award of Merit, and our artist took occasion to prepare a drawing from which the accompanying illustration (fig. 80) is given. These bigeneric hybrids are interesting for the opportunities they afford of comparing the influence of the widely separated plants used in obtaining them, on the progeny. In many cases the reverse of what might be expected is displayed, together with some curious and apparently contradictory features. In the present case although Lælia anceps bore the seeds, the plant has tall thin pseudobulbs more nearly resembling those of Epidendrum ciliare, whose elegant flower-scape is also in a measure produced; but the most marked feature in E. ciliare, its deeply-fringed labellum, is wholly suppressed, except so far as it might have influenced the wavy and irregular edge of the front lobe of the lip of the hybrid under notice, and in which the long well-defined isthmus of the blade of of the lip is a singular feature.

Epi-Lælia × Hardyana is a graceful hybrid. Its flowers have the sepals and petals blush-white tinted with rose on the lower halves. The base of the lip is blush-white, the tips of the side lobes and the front lobe being of a rich crimson-purple.

FORESTRY.

TRANSPLANTING TREES.

In regard to what has been written in a recent issue of the *Gardeners' Chronicle* on this subject, experience bids me say that autumn planting is the best. Some of the advantages are these, that taking

time by the forelock, the work can be got through or well advanced before wintry weather sets in; whereas on the other hand, if it is put off till the New Year is past, inclement weather or other untoward circumstances often occur that so retard the work, that at the advent of spring it is not completed, which means that it must be abandoned for a season, with a consequent loss of a season's growth, or prosecuted to its close, at a serious risk of both plants and labour being lost. Again, a young tree planted in the autumn has the subsequent winter's rain to wash and solidify the soil around the roots, giving to it something of the character of a tree that has been resting during the winter to resume its work in the spring. Further, when the soil is broken up to receive the tree, in the interval that elapses ere growth begins, a cohesive process is going on, tending in the direction of the soil resuming its normal state. Otherwise, not infrequently in stiff soil, the aperture formed by the spade opens up under the influence of the sun, exposing the roots and reducing the chances of success. The exception to the above rule is, when the plants are very small and the roots correspondingly small; in such cases spring planting is preferable, as during hard frosts there is an upheaval of the soil which subsides with the thaw, leaving behind the small plants in a half uprooted state. This is most marked when the ground is bare. The inference from the above would be for the planting of large plants in the autumn, for very small in the spring. With regard to the best months for planting, the adage that it is those in which the letter "r" occurs requires some local adjustment.

In the south of England, it would be well, perhaps, if it could be finished by the end of February, considering that in March there generally prevail cold and drying winds highly detrimental to the roots which would unavoidably be exposed; whereas in the highlands of Scotland it has, under different conditions, been carried on successfully well into May. *J.*

Belgium.

GHENT.

The Royal Society of Agriculture and Botany of Ghent opened, on November 11, its 160th exhibition, devoted specially to Chrysanthemums; but although of equally high quality, the specimens were not so numerous as at Antwerp, elsewhere alluded to. Orchids were also shown in quantities, M. Jules Hye-Leysen showing a fine lot of the true Cattleya labiata, a Vanda cœrulea with two spikes, one with sixteen, the other with eleven flowers, of very deep blue. The same gentleman also showed a Lælio-Cattleya Hyeana ×, a natural hybrid, presumed to have originated as a cross between Lælia grandis tenebrosa and Cattleya labiata autumnalis. Numerous Cypripediums were also shown.

Brussels.

The last meeting of the Orchidéenne was remarkable for the exhibition of Cattleya gigas var. Leopold II., and of some twenty supposed natural hybrids between Catasetum Bungerothi and C. macrocarpum. The Cattleya just mentioned was grown by Mr. Knight, in the garden of H.M. the King of the Belgians at Laeken, and was awarded a diploma of honour by *acclamation*. The perianth segments are pure white without spots; the lip is very large, with two broad yellow blotches, bordered with lilac at the throat. The column is ivory-white, emerging, as it were, from a base of a purple colour, veined with white and yellow. The free border of the lip is fringed, and of a rich velvety-purple.

The Catasetums were very varied in form and colour, some ivory-white, others greenish-white, or yellow; some very large some concave, some flattened and spreading, some campanulate, &c.

M. Cogniaux is engaged in the study of these interesting forms, and the result of his investigations will be awaited with interest. Various Cattleyas, Cypripediums, Odontoglossums, &c., contributed to the success of this exhibition.

Cattleya labiata alba.—M. Peeters has at this time a white form of C. labiata in bloom. In bud, the sepals are white, slightly tinged with green. *C. de B.*

The Week's Work.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

PALM-HOUSE.—Though not the best time for repotting Palms, still, the fact of their being less readily injured than many other stove plants allows of this operation being performed at this season. The same soil as before directed may be employed as well as the general treatment, save that less water at the roots is required at this season. The present is a good time for cleaning by washing or sponging all plants in this structure. I am in favour of sponging where the necessary time can be afforded. If the plants are not very dirty, soft-soap and water will suffice. If scale and red-spider have established themselves, Murray's Electric Mildew and Insect Destroyer should be applied to get rid of these.

ZONAL PELARGONIUMS.—These plants are now at their best, and require to be watered carefully, keeping them rather dry than wet at the root, and withholding all manurial aids as these tend to the premature decay of the flowers. Decayed leaves and flowers should be removed daily, and the house well ventilated, keeping at the same time a slight heat in the hot-water pipes. Plants past their best, if not already cut down, should be attended to, removing them to cooler quarters, and keeping them dry at the root for a considerable time.

HYDRANGEA HORTENSIS may be removed to a cold frame, plunging the pots in coal-ashes to winter, a slight protection being afforded them in hard weather.

CAMELLIAS.—Those plants with the most prominent flower-buds should receive waterings of diluted cowdung, with a small quantity of soot added to it, and if the plants are portable they should be brought into the conservatory as soon as the flower-buds begin to show colour, their removal giving the gardener a chance of washing the pots and tubs, and sponging the leaves with soft-soap and water, a matter which should receive attention in any case before Camellias come into bloom—good foliage being a great attraction in this plant.

THE CONSERVATORY.—With the introduction of the foregoing, a fresh arrangement will become necessary and desirable, and the Poinsettias, Calanthes, Cypripedium insigne, Richardias, Lily of the Valley, Hyacinths, and Tulips in bloom, may be added to the other occupants, and will assist in making a nice display. These plants will make it advisable to increase the temperature of the house a little, 55° by night, with a rise of 5° by day, with air admitted whenever it is prudent to afford it. Always at this season afford whatever water is necessary in the early part of the day, mopping up what flows from the pots and tubs, or is spilt on the floor.

RICHARDIAS.—If single crowns were potted up, their roots will have fairly filled the pots—a time when manure-water may be afforded with advantage, say once a week, continuing to do this for a time, and when it is seen that the plant responds to this stimulus, it may be afforded twice a week. The principal stock of this plant may be placed in a cool, airy house, and fumigation with Tobacco resorted to once a fortnight.

STATICE PROFUSA.—This plant may now be cleaned, repotting those which need it, providing them with new stakes, using a somewhat rich soil, to which may be added Thomson's Vine and Plant Manure, at the rate of a 6-inch potful to a wheelbarrowful of soil.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maidin Erlegh, Reading.*

MORELLO CHERRY.—If the pruning and training of the trees of the Morello on walls have as yet not been attended to, advantage should be taken of mild weather to attend to these matters, it being preferable to attend to them now rather than in spring-time, when there is always a risk of rubbing off the then prominent bloom-buds. Pruning will consist chiefly in cutting out as many of the naked shoots as there are young ones to replace them, the object being to keep the tree furnished throughout with bearing wood, but not to crowd it. The ground being in such a moist state, wide boards or trellises should in all cases be laid down for the men to stand upon whilst doing the work. The pruning and nailing having been finished, apply some strong kind of insecticide with a syringe for the destruction of black aphis, which the mild weather has not quite destroyed.

SWEET CHERRIES.—With the other kinds of work alluded to in former Calendars carried out up to the present date, the pruning, nailing or tying, and dressing of the Cherries other than Morellos may be prosecuted. Provided the summer pruning was duly performed, but little pruning will be required beyond shortening the leading shoots, removing dead spurs, &c. If any trees are infested with the brown-scale, so common on the Cherry, the branches should be loosened from the wall, and dressed with Fir-tree oil, or some other kind of insecticide, using a half-worn paint-brush in doing so. If the black-aphis be present on the trees, it will show itself in the present mild weather, and it can be destroyed either by syringing with strong insecticide as recommended in the case of the Morello Cherry, or by going over the shoots separately with a small paint-brush, getting the liquid well round about the buds. Sweet Cherries are such capital additions to dessert that no labour is ill-bestowed in trying to have them in good condition, and so that the season of the sweet Cherries may be prolonged as much as possible, besides obtaining suitable sorts, they should be planted on walls of different aspects, as well as grown as bushes or pyramids in the open ground. The proper soil for the Cherry is a strong loam on a naturally well-drained substratum of limestone, chalk, &c.; and in preparing stations for trees these items should be borne in mind, substituting mortar-rubble for chalk or lime where lime does not exist in the staple. The following are good varieties to plant in gardens—Early: Frogmore, Early Bigarreau, Governor Wood, and Knight's Early Black. Midseason: Cleveland Bigarreau, May Duke, and Black Tartarian. Late: Bigarreau Napoleon—which, all points considered, is the most valuable Cherry that is grown.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

PLANTS IN BLOOM.—Amongst Orchids now in bloom, the lovely forms of Dendrobium Phalænopsis are those most conspicuous at the present time, and those plants which are in flower should be arranged at that part of the warm house where the ventilators are more or less open at all times, or, if convenient, they might be placed in the Cattleya-house, the drier air of which would be even more suitable for them. Previous to placing recently-imported plants of the above Orchid with others, they should be thoroughly examined for a destructive beetle which is common to them. The presence of these insects is indicated by small holes found in the pseudobulbs; and the only effectual means of extermination is to cut off the bulbs so pierced, and forthwith burn them. It is not advisable to place the newly-imported pieces in a growing temperature at present. Amongst other plants in flower at the present time is Cœliopsis hyacinthosma, a species not generally known, but all the same well worth attention from the amateur, and especially where botanical species are appreciated. The sweet Hyacinth-scented flowers of wax-like texture are much admired at Burford; and the plant is of easy culture. The flower-spikes issue from the base of the plant as in a Stanhopea; it is, therefore, necessary to suspend it from the roof in a shallow basket. Owing to the spikes protruding from below, no crocks can be used for drainage, and the material for it to root in should consist of rough peat and sphagnum-moss. The temperature that suits it is that of the East Indian-house. Like most other species of Orchids, it requires watering copiously whilst growing, and when at rest it may be kept rather dry. Another rare Orchid of similar characteristics now producing its flower-spikes is Schlimia trifida, but, unlike the preceding one, it requires an intermediate temperature to grow it satisfactorily.

ODONTOGLOSSUM CORONARIUM.—This species, although not very rare, is too seldom seen in flower. It is now fast pushing up its flower-spikes with us, and should be at the warmest part of the house, in a position where the greatest amount of light can reach it. It is a plant that at all times requires moisture liberally supplied at the root, and should have plenty of living sphagnum moss growing on the surface of the soil, in and to which the roots penetrate freely. Another charming little plant now in bloom is Angræcum distichum, one of the smallest-flowered species, which, if only on account of the delightful fragrance of its numerous snow-white flowers, well deserves a place in collections. Like Angræcums generally, the East Indian-house is the most suitable place for it. The handsome winter-flowering species, A. sesquipedale is fast pushing up its flower-spikes. A small yellow species of thrips is apt to infest these, which

may be got rid of by fumigating the house, failing this, a whole year's inflorescence may be disfigured. If fumigation be objected to, occasionally dust the spikes over with strong Scotch snuff. Growing in the same house are Oncidium papilio and O. Krameriannm, which do well if suspended in small baskets close to the roof-glass. For some weeks past these plants have produced a number of their remarkable butterfly-like flowers. All Orchid growers know that the spikes continue to produce a succession of blooms for a very long period; but if they are allowed to do so unchecked the plants become exhausted; therefore their flowering season should not be unduly prolonged, the spike being cut clean away after a certain number have opened.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

PINE-APPLES.—During the dark days, the temperatures of the house and pits and the beds in which the plants grow will need careful attention. It is not good practice to starve the plants, and hope for the production of well-formed good-flavoured fruits. Those of the Queen family which it is intended to start for early fruiting at the end of the month of December should not be subjected to a lower night temperature than 60°, or day temperature of 70°. Air should be admitted on fine days, but not so as to lower the warmth, the bottom-heat being kept steady at 80°. Watering will be but little required, although much dryness of the soil ought to be avoided. If plunged in a deep bed of tan and leaves, and not given much fire-heat, the plants will keep in good condition for several weeks at this time of the year without any water being afforded the soil in which they are growing. The danger of too great a degree of dryness at the roots is premature fruiting. The air of the house may be kept rather dry, and instead of damping and steaming the pipes, and keeping the evaporating-troughs full of water, moisten the walls and floors. Early-potted suckers, well established in their pots, should now be afforded a night temperature of 55° to 60°, day temperature 65° to 70, with a good circulation of air on mild days, and the bottom-heat not higher than 75°. These plants must be kept rather on the dry or resting side. Late-potted suckers will require a warm moist temperature until they are well rooted, when a small amount of air should be admitted. Plants of Smooth Cayenne, Charlotte Rothschild, and Black Jamaica, now with fruits swelling off, require a liberal supply of tepid water at the root; Smooth Cayennes, if well rooted, requiring more than the other varieties. The bottom-heat may be kept at about 85° night temperature, of the house at 65° to 70°, and day at from 80° to even 90°, when the latter figure can be obtained by the aid of sun-heat. Do not damp or syringe the plants overhead, but moisten the floors once or twice daily, steaming being omitted. At this season the roof of the house or pits may be covered with canvas when the air is frosty, covering being less injurious to the Pines, and less burdensome to the pocket than hard forcing.

EARLY PEACH-HOUSE.—Clean, train, and top-dress all borders without delay, and if Peaches are required in May, the house may now be closed, affording the border, if dry, a thorough soaking of clean tepid water. The temperature should not fall below 40° for a period of a fortnight, as little fire-heat as possible being employed during that time; afterwards an increase of 5° by night, to 55° to 60° by day with sunshine, may be permitted. Syringe the trees twice daily with tepid water, and afford air on fine days, always advancing slowly. After growth has advanced a little, and the envelopes of the flowers show signs of expanding, the warmth being increased, always given freely; but sudden changes of temperature, such as are brought about by admitting cold air in large volume, must be carefully avoided by the cultivator.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

BEDDING PLANTS.—To keep these plants in good condition throughout the winter strong growth should be promoted, and with this intent the lights should be pulled off the pits in bright open weather, and provided there is no danger from frost or heavy rain they may be left off so long as it is safe so to do. The same practice should be carried out as far as possible where they are stored in vineries, and by having both top and bottom ventilators open both night and day, and should dull or wet weather occur, a small amount of fire-heat may be used occasionally, so as to prevent damping. Remove decayed leaves and flowers, the latter as soon as possible, and any gaps in the cutting-boxes or pots may be filled up, taking care not to disturb the other cuttings more than is necessary.

LAWNS.—Now is the time, when the worms being close to the surface, to apply lime-water to the turf, which will cause them to come to the top, when they may be swept up. This treatment must be followed up if perfect lawns are wished for, the mere rolling of the turf and sweeping up of the worm-casts having no effect whatever in abating the worm-nuisance. Weeds of size should be removed bodily, or in the case of plantains these may be destroyed by thrusting a pointed piece of iron down the centre of the root, first dipping it in a bottle containing oil of vitriol, taking care not to drop it on the grass, and to use strong leather gloves whilst carrying out this kind of work. The keeping of this poisonous liquid under lock and key may here be enjoined. Any uneven parts should now have attention, cutting and rolling back the turves, and filling up the depressions with good fine soil, or removing hillocks, and returning the turves, thoroughly beating and rolling them.

HOLLYHOCKS.—See that these plants are carefully labelled if named varieties are grown, and if they are to remain in the ground a little protection should be afforded them by placing rough leaf soil or strawy manure around them. All the choice varieties it will be prudent to lift and winter in large pots in cold frames. Cuttings struck in July last that have been potted up will also require to be wintered in a cold frame, and these will make good strong plants for next year's flowering.

CHRISTMAS ROSES.—If strong clumps exist and these are throwing up their flowers, hand-lights should be placed over them, resting the lower part on three bricks, thus admitting sufficient air, the flowers are thereby kept clean, the flower-stalks are longer, and the plants are protected from the weather.

NARCISSUS.—To ensure a supply of cut flowers in the early spring, some beds of the earliest varieties should be planted. If a part of a warm border can be spared for them, blooms will be obtained at least a fortnight earlier than from bulbs in the more open quarters. Although somewhat late in the year for bulb planting, they may yet be planted, selecting the largest bulbs, and planting them in soil of good quality, which, if it be light, will be so much the better; and if heavy, a liberal top-dressing of leaf-mould and rotten manure will be an aid to the realisation of good results. Plant the bulbs in lines 10 to 12 inches apart, and follow the same method as that advised for Lilies in an earlier Calendar. Some of the more useful early varieties are—Large trumpets: Achilles, Bulbocodium, Early Spanish Yellow, Countess of Annesley, Golden Plover, Golden Spur, Lorifolius, Major (the early variety), Minor, Nanus, Obvallaris, Pallidus præcox, Rugilobus. Medium trumpets: Orange Phœnix, Queen Bess, Sir Watkin, Stella, Odorus. Small trumpets: Biflorus, Burbidgei, Poeticus, Poeticus ornatus, and Poeticus plenus.

THE APIARY.

By EXPERT.

CANDY FEEDING.—Mild weather in the winter usually causes activity amongst the bees, and larger quantities of food to be consumed. Should the present mildness continue for any length of time, it will be necessary to supply sugar-candy to stocks that are not well provisioned. Many bee-keepers place a large flat cake of sugar-candy under the quilts in the autumn so as to economise the sealed food in the combs and also to ensure means of passage for the bees over the tops of the frames during the winter. The Demerara sugar of the shops is well fitted for making candy, and if a small proportion of honey be added in the making of it is much more palatable to, and more readily taken by the bees. In districts where it is suspected that foul brood exists, it is advisable to medicate all artificial bee-food with naphthol beta which, first dissolving it in spirits of wine, as well as to drop two or three pieces of napthaline on to the floor-board of each hive to prevent infection.

WINTER ENEMIES.—A watch should be kept for sparrows, tomtits, and some other birds in the habit of feeding on bees when other insect food runs short, and if observed, measures must be taken to prevent their depredations. This may be done by fixing a piece of fine-meshed wire netting over the hive entrance, although it is not very often that such a precaution is actually needed. Mice sometimes give trouble, and may be kept out of hives by reducing entrances to a depth of three-eighths of an inch. Damp is a greater enemy, and more to be feared than either of the preceding, and every means should be taken to prevent the ingress of wet through the roofs or plinths of hives. Heavy rains and snow require some attention in the way of paint and putty to effectually keep them out.

WIDE *v.* NARROW SHALLOW FRAMES.—Wide shallow frames have been tried by several bee-keepers during the past season side by side with the ordinary shallow frame, spaced 2 inches from centre to centre by means of the new metal ends. Some of the disadvantages found with the latter were that in some instances where two sets of frames were used and placed one above the other the bees continued comb-building downwards irrespective of the bottom bar in top frame, and so joined the two together. In other cases the increased spacing caused the bees to build comb the natural width only in the frames, and then to fill up the intervening space with an independent comb. Neither of these objections was experienced with the wide frames, as the bees filled and finished them off to the extreme edges as readily as they do sections with which, when finished, they compared very favourably in appearance. Were it not for a little extra care required in using the uncapping knife, so as not to slice off wood as well as wax, there would be little question as to which of the two is the better for general use.

THE KITCHEN GARDEN.

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

ASPARAGUS.—The foliage having died off, may now be removed from the beds, which may be expeditiously performed with an old scythe. About 2 inches of stem should be left to indicate the position of the stools when hoeing or pricking over the soil. If seed has formed, this should be removed, first cutting it off quietly, so that none be shed. After clearing the tops away, and hoeing and raking off all weeds, make the beds neat and trim for the winter. As regards top-dressing for the winter, decayed manure in small quantity will, if laid lightly on the beds, allow air and sun to have effect on the soil. This top-dressing should occasionally be shaken up during the winter, choosing dry weather for the work. Heavy dressings of rotten manure tend to make the beds cold and wet, retarding the growth of the plants in the spring, an evil perhaps more fully felt in late cold soils and districts. I object to having the alleys dug, so many roots being destroyed by this practice, and I fail to see what good it does. Rows of seedlings for next year's plantings should have their tops removed, and a light protection of litter or dry Vine-leaves spread over them, which must be removed when the drying winds of March are past. The stools which are to be taken up for the purpose of forcing them should be protected with litter on the approach of frost, so that there may be no difficulty in getting them at any time.

FORCING ASPARAGUS. — The plants having slightly rested from growth, forcing may commence. In taking up the roots do so with care, retaining as many of them as possible in an unbruised condition. Asparagus, contrary to Seakale or Rhubarb, is not benefited in the least by drying of the roots, therefore the roots must not be left uncovered after being dug up. Forcing may be carried on in pits heated by hotwater, or in dung-bed frames; and if the latter course be adopted, the fermenting material should be well turned over and sweetened before being made into a bed. The size and thickness of the latter should be such that with the assistance of dung linings, a steady temperature of 60° to 65° can be maintained for several weeks.

CARDOONS. — These plants need some kind of protection in frosty weather. Continue to blanch any plants which are large enough, by means of hay-bands or litter wound round the stalks; if the latter, the leaf-stalks must be tied together with broad strips of bast at first, and it is advisable to put a stout wooden stake to each plant, or a gale of wind will do much harm to them. When perfectly blanched, the plants may be lifted and placed in the vegetable-store until required for use.

POTATOS.—A sufficient number of sets to plant a succession of beds may now be placed in an upright position, eyes uppermost, in boxes, and brought into a warmer house to sprout before planting them. The forcing of Potatos may be done in pots, placed in forcing-houses, vineries, &c., or in beds under frames.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY,	Nov. 27	Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster.

SALES.

MONDAY,	Nov. 26	Dutch Bulbs, at Protheroe & Morris' Rooms. Hardy Perennials, Carnations, Picotees, Lilies, and Iris, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 27	Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 28	Dutch Bulbs, at Protheroe & Morris' Rooms. Consignment of Japanese Lilies, Roses, Begonias, &c., at Protheroe & Morris' Rooms. Sale of Fruit Trees, at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Horne, by Protheroe & Morris.
THURSDAY,	Nov. 29	Azaleas, Ferns, &c., at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 30	Dutch Bulbs at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Dec. 1	Dutch Bulbs at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.4.

Open spaces in the Metropolis.

FIFTY years since, the green spots on the map of London indicating parks and open spaces, were very few, and, with the exception of what may be termed the greater parks, very far between. Had any one at that distance of time ventured to prophesy that in half a century there would be in existence nearly 200 such places for recreation and health-giving resort for the millions, he would have been laughed at as a dreamer of vain dreams. That the millions inhabiting the great metropolis have to-day so many "lungs" is due to the munificence of the City magnates, the far-seeing eyes of the late Board of Works, the existing County Council, private action and beneficence. True, the price now being paid by the ratepayer is a heavy one, but then of all the great cities of the world London is now the healthiest, for the proof of which, see the Registrar-General's Returns.

Our County Council appear to be always *en evidence* in the matter of public parks and their smaller relatives; they seem to be always engaged in acquiring or laying-out some suitable piece of land for the recreation of toilers and their children; or for those who, unable to do anything at gardening at their own houses, desire and appreciate some nicely laid-out piece of ground where the work of a good gardener can be seen and admired.

The committee of the County Council, to whom the care of some of the London parks, &c., has been handed over, only the other day submitted a report of their doings, which interests, among others, all who helped to "foot the bill." Mention is made in this statement of the charges for seats around the band-stands in the Council parks, which payments had been discontinued, but this report recommends a return to the practice of charging for seats near to the stands. In the future, half the seats will be charged for at the rate of one penny; perhaps by-and-by the other, and outer circle, half may be let to sitters at a halfpenny each.

As to the maintenance of small open spaces, it is noted that there is much diversity in the way these are kept up: many are permanently upheld by the Council, and some, as with the churchyards and playgrounds, formerly maintained by the Metropolitan Public Gardens Association, are temporarily supported by the Council out of the County fund; some are carried on by the vestries and district boards out of local rates; whilst others are maintained by private individuals or by the Government. A return has been made of the open spaces, churchyards, &c., in the county of less than ten acres in area, which are at present kept up for the enjoyment of the public: the total number is 198, and the aggregate area 354½ acres. In addition to these, three local authorities keep up some 57 acres as recreation grounds. The committee are of opinion that all these open spaces should be managed by one authority, and on a common basis; but the matter will have to stand over in view of the proposed scheme for "unification" becoming law. To avoid centralisation of management, it is proposed that all open spaces under ten acres shall be in the care of the local authority, the certificated charges for the said management being paid from the county rates—the large parks being managed as now.

It is occasionally complained of, that several open spaces are being deprived of their old natural aspect, and are in part acquiring a gardenesque appearance; should this be true, one can only say that it is pity—we want as much of Nature in town or suburb as can conveniently be had; it recommends itself also to the ratepayer on the ground of economy. In any case, open spaces in the heart of the town and in the most densely-populated quarters are now what is most required.

The Antwerp Exhibition.

THE horticultural section of the Universal Exhibition has been eminently successful, and this is the more worthy of comment, as usually on these great occasions horticulture takes a subsidiary position. The exhibition was closed in brilliant fashion by the display organised by the Royal Horticultural Society of Antwerp. Chrysanthemums were, of course, the principal objects exhibited, and the number of plants, their culture, their flowers, and the selection of varieties were such as ensured high praise for the exhibitors, and never has an exhibition in this city been more numerously attended.

The principal varieties shown on this occasion were W. H. Lincoln, Mrs. Hicks Arnold, Préfet Robert, Vice President Calvat, Miss Blanche Payne, Edw. Molyneux, and Madame Ed. Rey, represented by specimens more than a yard and half in diameter, and a yard high, and each bearing at least 100 expanded flowers on the average, each flower 5 to 6 inches across (18 to 20 cm).

Among the newer varieties, the most appreciated were Madame Anatole Cordonnier, Colossus, Grenoblois, Madame Benjamin Giroux, Madame Gruyer, Master Jerome Jones, President Arnauld Toulon, Deuil de Jules Ferry, Charles Davis, Madame Carnot, and Madame Seago.

A general exhibition of cut flowers and ornamental plants was held at the same time, while overhead were displayed the standards and banners of the various agricultural and horticultural Societies of the kingdom. On this occasion also, M. JULES HYE-LEYSEN, of Ghent, showed some remarkable Orchids, among them Miltonia Leopoldi, a unique specimen, of great beauty; Cypripedium Albertianum, Cattleya Hardyana, &c. The busts of their Majesties the King and Queen of the Belgians were enshrined in a bower of Orchids and Palms, contributed by M. CHARLES VUYLSTEKE.

BEGONIA HAAGEANA.—There are several large specimens of this noble species of Begonia in the Begonia-house at Kew which have been in flower since last June. It is impossible to speak too highly of it; certainly if I were called upon to name the six best shrubby Begonias, this would be one of them. It forms quite a big bush, for I have seen it nearly 6 feet high and a yard through at Kew, and its handsome metallic-green, red-tinged leaves, red stems, large crimson stipules, form a picture in themselves. The flowers are in large, loose, sub-pendent cymes, each cyme being from 6 inches to 1 foot across, and they are crowded with large flowers of a pink-white colour, and covered with red hairs, which form quite a boss on the lower part of the large petals of the male flowers. It is remarkable that whilst in B. coccinea (corallina) and its allies the female flowers are much more conspicuous and attractive than the male flowers, the order is reversed in B. Haageana and its near relations. The female flowers can be seen in accompanying illustration (fig. 81); they are only about one-sixth the size of the males. The ovary is green, three-winged, one of the wings being much prolonged, and there are five petals in each flower. B. Haageana was introduced from Brazil in 1887 by Messrs. HAAGE & SCHMIDT, of Erfurt, who sent it to Kew to be named, requesting that it should bear the name of Dr. SCHARFF, from whom they obtained it. Unfortunately, they sent another and a different plant to Dr. REGEL, St. Petersburg, with the same request. He published a picture of his plant under the name of B. Scharffiana, Regel, in the *Gartenflora*, 1888, p. 127, and soon afterwards the Kew plant was figured and described in the *Botanical Magazine*, t. 7028, also as B. Scharffii. The difference between the two was soon afterwards pointed out in the *Gardeners' Chronicle*, October, 1889, p. 388, when the Kew plant was renamed B. Haageana, Watson, and described then as "one of the very finest of the evergreen Begonias, certain to become a popular plant." I suspect that B. Scharffiana, a much inferior plant, is still allowed to do duty for B. Haageana, hence its failure to win the favour it really deserves. This illustration will enable growers to recognise B. Haageana. The true B. Scharffiana has larger, thicker leaves of a dark olive-green above, larger stipules, and a long stout flower-stalk, which sometimes bears a cluster of leaf-like bracts, and comparatively few flowers. It also is a striking Begonia, but not to be compared with B. Haageana. A hybrid between this and a near ally, viz., B. metallica, was raised and distributed in 1891 by Messrs. LEMOINE, who named it B. Credneri, and the same hybrid was sent out in the following year by M. BRUANT under the name of B. Duchartrei. Neither hybrid is as good as B. Haageana. *W. W., Kew.*

LINNEAN SOCIETY.—This Society met on Thursday, November 15, Mr. C. B. CLARKE, F.R.S., President, in the chair. Dr. DAVID PRAIN was admitted a Fellow. The Rev. G. HENSLOW exhibited some curious iron implements, of somewhat varied pattern, used in Egypt for cutting off the top of the Alexandrine Fig (Ficus Sycamorus, Linn.), the operation being necessary to render it edible, by getting rid of the parasitical insect, Sycophaga crassipes, Westwood, with which it is always infested. The practice was said to be very ancient, being described by THEOPHRASTUS, and alluded to by the same word, κνίζων, in the Septuagint version of the Old Testament (Amos vii., 14), in translating from the

Fig. 81.—Begonia haageana: flowers white and pink. (see p. 632.)

Hebrew. Mr. H. N. Ridley showed some drawings of the green larva of a Sphinx-moth mimicking a green-tree snake, Trimeresurus Wayleri, as well as a cluster of caterpillars mimicking a fruit, all of which were found in Singapore. He also exhibited a drawing from life of the tan-producing Gambir-plant, Uncaria gambir, in flower. Mr. Thomas Christy exhibited some germinating seeds of Pepper, showing the testa being carried up by the cotyledons. A paper was then read by Dr. D. Prain on the plant yielding Bhang, Cannabis sativa. Illustrating by lantern-slides the anatomy of flower and fruit in Cannabis, he reviewed the theories propounded of their structure; confirmed from teratology those of Payer (1857) and Celakovsky (1875), and refuted those of B. Clarke (1853), and Macchiati (1889). He then explained the relationships of (1) the fertilisation or otherwise to the development of narcotic properties; and (2) of the various forms of narcotic to each other. A series of monœcious conditions described in plants of both sexes show that the so-called male flower is probably an inflorescence, the perianth-segments being bracts, not sepals, while the stamen is the homologue of the anterior sterile carpel of the ♀ flower. A paper on the proposed revision of the British Copepods, by Mr. Thomas Scott, was, in the unavoidable absence of the author, read by the Secretary.

Royal Horticultural Society.—At the next meeting of this Society, which will be held in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, November 27, Mr. James Douglas will deliver a lecture on the "Principles of Judging at Flower Shows."

Horticultural Club.—The usual monthly meeting and conversazione took place on Tuesday, November 13, at their rooms, Hotel Windsor, Victoria Street, Westminster. The chair was occupied by Mr. C. E. Shea, and there were present beside, Messrs. J. H., C. E., and A. H. Pearson, Henry C. Seebohm, George Bunyard, George Paul, J. Assbee, H. Selfe-Leonard, Harry Turner, W. J. Jeffries, and other gentlemen. A very interesting lecture was given by Mr. C. E. Pearson, on "The Flora and General Characteristics of Iceland," from observations made during a recent visit to that island. He gave an account of the plants observed by him, and showed that the flora is very similar to that of the British Isles.

Royal Society.—The first meeting of the new session of the Royal Society was held on Thursday, Nov. 15, at Burlington-house, when three papers were read. Mr. H. H. Dixon and Dr. J. Joly, F.R.S., presented a paper on "The Ascent of Sap." It was pointed out that Strasburger's experiments have eliminated the direct action of living protoplasm from the problem of the ascent of sap, and have left only the tracheal tissue as an organized structure, and the transpiration-activity of the leaf wherein to seek an explanation of the phenomenon. The authors investigate the capability of the leaf to transpire against excessive atmospheric pressures. In these experiments the leaf was found able to bring forward its water meniscuses against the highest pressures attained, and freely transpire. Whether the draught upon the sap established at the leaf during transpiration be regarded as purely capillary or not, these experiments lead the authors to believe that it alone is quite adequate to effect the elevation by direct tension of the sap in tall trees. Explanations of the lifting of the sap from other causes prove inadequate. A reconsideration of the principal experiments of previous observers, and some new experiments of the authors, lead to the view that the ascent is principally in the lumen and not in the wall. Professor W. C. Williamson, F.R.S., and Dr. D. H. Scott, F.R.S., presented a further contribution on "The Organization of the Fossil Plants of the Coal Measures," a subject which the former has been investigating for many years. The present contribution was "On the Roots of Calamites." The following are the conclusions come to by the authors:—(1) The fossils hitherto described under the name of Astromyelon Williamsonis are the adventitious roots of Calamites; (2) their structure is in all respects that characteristic of roots, as is proved by the centripetal primary wood, the alternating strands of primary wood and phlœm, the endogenous mode of branching, and the absence of nodes; (3) the smallest specimens, with little or no medulla, represent the finest branches of the same roots, of which the large medullate forms are the relatively main axes. The paper is illustrated by micro-photographs from the actual specimens, and also by camera-lucida drawings. *Times.*

Harrison's Midland Root Show.—Messrs. Harrison & Sons, Market Place, Leicester, held their annual exhibition of vegetables and farm-roots in the Market Hall, on the 14th and 15th inst. Potatos and Leeks were exhibited of very fine quality, and Celery and Carrots also, but the farm-roots were rather below usual quality, on account of the adverse climatic conditions of the past season.

BIRMINGHAM SELBORNE SOCIETY.—At a meeting of this Society, held on the 16th inst., Mr. HUMPHREYS lectured on "The Mechanical contrivances of Plants," and gave many instances of protections provided against insect pests by plants.

DEVON AND EXETER GARDENERS' ASSOCIATION.—At the meeting of this society held in the Guildhall, Exeter, on the 14th inst., a paper prepared by Mr. A. C. BARTLETT, foreman in Dropmore Gardens, Maidenhead, and entitled "Hardy Flowering Trees and Shrubs," was read before a fairly good attendance.

A NURSERYMAN HONOURED.—We are pleased to see that the name of Mr. JNO. METHVEN, of Messrs. T. METHVEN & SONS, Nurserymen, Edinburgh, has just been added to the Commission of the Peace for that city.

CHRYSANTHEMUMS AT THE GUILDHALL.—On Thursday, the 15th inst., a select exhibition of Chrysanthemums, contributed by the City Councillors and a few friends, was held in one of the Committee Rooms of the Guildhall, London. No exhibition of the kind has been held in this hall for some years, but the great show of fruit some seasons ago will be well remembered. It is said, however, that a large Chrysanthemum show was held about thirty years ago. The present display was a very interesting one, and some good exhibits were staged. Mr. R. J. Collier, C.C., who had first honours for Japanese blooms, was also successful in several other classes. Deputies Rogers and Gover were also winners in many classes. Among other successful gentlemen were Mr. C. Bayer, Mr. C. C. Black, Mr. J. Lake, and Mr. J. Read. Mrs. R. H. Rogers beat her opponent, Mr. Deputy Gover, for two vases of Chrysanthemums, and showed very tasteful arrangements. The arrangements for the exhibition were in the hands of Mr. Deputy Rogers and a few friends.

SHIRLEY AND DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting was held at Shirley, Southampton, on Monday, the 19th inst., when the President, Mr. W. F. G. SPRANGER presided over a fair attendance of members. The lecture was supplied by the Technical Department of the Hants County Council, and the lecturer, Mr. W. C. HERBERT GREAVES, F.R.H.S., gave an interesting discourse on "Some Insect Pests and Fungi." The Potato fungi occupied a large share of his attention, and by the aid of numerous large diagrams he illustrated the life-history of this scourge. The remedies he recommended were, spraying with sulphate of copper, burning all haulm and weeds from plots infected, some weeds being liable to attack; the rotation of crops, and the selection of disease-resisting varieties when planting. The Onion fungi was also described, but the lecturer said a remedy was not yet known to science for it. Clubbing was also illustrated by diagrams, the use of gas-lime on some soils being considered a good remedy; a better one, the lecturer thought, was to plant crops liable to this disease on the same ground only once in five or six years. Many interesting questions were put to the lecturer, and answered satisfactorily. One of his hearers, in complimenting the lecturer on the accuracy of his diagrams and descriptions, expressed an opinion that the Potato disease was largely due to our method of cultivating the plant from sets continuously, and the rarity with which seedlings are used, this being, in his opinion, highly detrimental to plant-life. A vote of thanks to the lecturer and chairman concluded the meeting. A paper on the "Cultivation of the Eucharis" will be given next month, by Mr. JESSE JONES, The Gardens, Terrace House, Southampton.

SURVEYORS' INSTITUTION.—The next Ordinary General Meeting will be held on Monday, Nov. 26, when a paper will be read by Mr. A. DUDLEY CLARKE (Fellow), entitled "The Incidence of Taxation on Land." The Chair to be taken at 8 o'Clock. Those proposing to enter their names for the Students' Preliminary Examination, to be held on January 23 and 24, 1895, must intimate their intention to the Secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland, and Northumberland, at Manchester. Candidates from other counties in England and Wales will be examined in London. The "Crawter" Prize, of the value of £10, will be awarded at the next Examinations in Division IV., for the best work (if of sufficient merit) in the subject—"Principles and Practice of Valuation."

THE YORK GALA.—The balance-sheet for 1894 shows an income from various sources, of £2293, the gate-money on the three days of the last exhibition amounting to nearly £1800. The expenditure includes prizes and judges' fees, £654; music and amusements, £410; and tents, staging, fittings, &c., £390. During the years 1893 and 1894, nearly £560 has been given to the York charities, and the large amount of close upon £2300 stands to the Society's credit in investments and property.

A NURSERYMAN'S GOLDEN WEDDING.—On Thursday, the 15th inst., Mr. and Mrs. BIDDLES, of the Middlefield Nurseries, Loughborough, celebrated their golden wedding, when between eighty and ninety guests, including the *employés*, were entertained. Mr. BIDDLES is the head partner of The Penny Packet Seed Co.

"HISTORY OF PLANTS INDIGENOUS TO SWITZERLAND," BY ALBERT VON HALLER.—This valuable work has just been presented to the Lindley Library, by Mr. JAMES DOUGLAS, of Great Gearies, Ilford. It consists of three folio volumes bound together in one. Although the date of publication is 1768, it is evident that the author had either begun the work or contemplated doing so about thirty years prior to that date, as some of the engravings were drawn in the year 1740. The book which Mr. DOUGLAS has sent to the Library shows evidence of having belonged to various people. Judging from the writing we should say that first of all it belonged to FRANCIS ELEMENT, who seems to have presented it to a WM. OSBORN. The bookmark, which is somewhat destroyed, is that of JANE DALTON. But perhaps the most interesting feature in connection with the work is the fact that it bears the signature of J. J. ROUSSEAU, of whom it is stated in *Rees' Cyclopædia*, that "in 1768 he resumed his botanical pursuits by collecting and studying the plants which he found on the mountains of Dauphiné." ROUSSEAU seems to have utilised VON HALLER'S *Historia* to a very great extent, as he has taken the trouble to correct the synonymy of over one hundred names. There can be little doubt that the handwriting is his. The R, o, u, e, and old-fashioned "s" in Rhododendron hirsutum, are identical with the same letters in his signature, but are evidently of more recent date—being less faded in colour. To give some idea of this particular work of ALBERT VON HALLER'S, it may be stated it was dedicated to GEORGE III., and published at Berne in 1768. The first volume consists of 444 pages, and plates 1 to 20; the second volume of 323 pages, and plates 21 to 44; and the third volume of 204 pages, and plates 45 to 48, and according to PRITZEL this is the entire work. VON HALLER'S system is naturally obsolete now. He began with the Compositæ, and worked through Labiatæ, Papilionaceæ, Cruciferæ, Solanaceæ, down to Ferns, mosses, lichens, Algæ, and Fungi. The three volumes together make 971 pages, including a copious index, and for purposes of reference the work is a most useful addition to the Lindley Library.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The annual meeting of this Society was held in the Music Hall Buildings, Aberdeen, on Saturday evening, 17th inst. There was a very large gathering, and Sir ARTHUR GRANT, Bart., of Monymusk, Chairman of the Society, presided. The directors' report, and the accounts for 1894, were submitted. From the latter it appeared that the income for the season amounted to £840 4*s.* 4*d.*, and the expenditure to £1048 9*s.*, leaving a deficit of £208 4*s.* 8*d.* The balance at the credit of the Society now stood at £370 8*s.* 5*d.* In moving the adoption of the report and accounts, the Chairman said he regretted the Society had lost, by death, the support of several old friends—Mr. PETER ESSLEMONT, late chairman of the Scottish Fishery Board; Mr. GRAY, Mr. PICKOP-DUTTON, and Mr. JOHN CROMBIE, Balgownie Lodge; but he had the pleasure to report that Mr. FARQUHARSON, of Invercauld, Balmoral; Sir PETER LUMSDEN, K.C.B.; and Major-Gen. NORRIE had become Vice-Presidents. Sir ARTHUR, in referring to the main incidents of the year, and explained how, in his opinion, the Society's shows were not so successful as in previous years. He then read the following letter, which the Secretary had received from Mr. H. DUNBAR, Brander, Pitgaveny, Elgin, in which the writer objected to fruit and vegetables grown in Devonshire being shown at Aberdeen. Commenting upon this letter, Sir ARTHUR said it had been the rule that the entries for the Society's shows should be open to everyone; in fact, their exhibitions had challenged the world, and in some points, at all events, for instance, Messrs. COCKER'S Roses — they had fairly held their own against all comers. The Society, said Sir ARTHUR, had for its object the encouragement of scientific horticulture and to extend its practice. Were they to be reduced to protection? He thought not. Let one and all send in their best exhibits. If the southern competitors beat them, they at least learned how to direct their efforts afresh, and if they beat the southern competitors, all the more credit to them. Sir ARTHUR GRANT, the retiring chairman, was unanimously re-appointed; and Mr. LYON was elected vice-chairman.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the Floral Committee took place on the 21st inst., at the Royal Aquarium, Mr. R. BALLANTINE in the chair, a considerable number of new varieties being staged. M. E. CALVAT, Grenoble, France, was again to the fore, with some very fine varieties. On this occasion he received First-class Certificates of Merit for C. Harman Payne, purple-amaranth, with long drooping petals, large, full, and very bright in colour; and Directeur Tisseraud, a very distinct and attractive variety, having a bright red surface, the tips and reverse of the petals golden. M. Chenon de Leche, salmon-fawn, suffused with rose and gold, a large full flower, commended. Other of M. Calvat's new varieties were M. H. Vander-Linden, a buff-yellow flower, in the shape of Stanstead White; M. Hoste, delicate blush, the centre suffused with pink, large, broad, drooping petals; and Ma Perfection, an incurved white, a little rough as shown. A vote of thanks was passed to M. Calvat for his exhibits. First-class Certificates were also awarded to Charles Cox, a large compact ball-like pale yellow flower, six blooms of which were shown from Mr. C. Cox, Brickendon Grange, Hertford. To incurved, Owen's Crimson, rich crimson surface, with chestnut-crimson reverse, bright and distinct; Enfant des Gaules, an incurved hairy Japanese, yellow, tinted with bronzy-pink, a very distinct and fine variety; and incurved John Fulford, chestnut purple, the centre deep gold, very promising. Mr. Owen also had Castle Hill, a deep golden Japanese, fine in colour but thin in substance, and others. A vote of thanks was passed to Mr. Owen for his exhibit. A First-class Certificate of Merit was awarded to a charming little Pompon, a sport from Snowdrop, named Miss Gertie Waterer; blush, with orange and bronze centre; very pretty and pleasing. Mr. Ives, gr. to E. C. Juker, Esq, Barnet, had Hadley Yellow, a fine incurved Japanese in the way of Lord Brooke, which the committee wished to see again; and the same request was made in respect of Mrs. John Briscoe, a Japanese, gold in colour, in the deep bronzy-orange centre and drooping florets, from Mr. H. Briscoe Ironside, Burgess Hill. Mrs. R. Filkins, a decorative Japanese yellow, with curious-toothed florets, from Messrs. H. Cannell & Sons, Swanley. Japanese Vancanson, pale lilac-pink with pale reverse, very promising; and Japanese

Anemone Rider Haggard, blush ground with blush and yellow centre, a variety that will no doubt be seen in better character next year, both from Mr. H. J. Jones, Ryecroft Nursery, Lewisham; who also had incurved William Carpenter, delicate lilac-pink, with silvery-white centre, and large-flowered Anemone Partridge, rosy-fawn, with orange centre, having a fine cushion—this was highly commended. Mr. Charles E. Shea had Miss Elsie Teichmann, in the way of W. H. Lincoln, but not so deep in colour.

Notices of Books.

A Manual of Exotic Ferns and Selaginellas.*

That it is useful so far as it goes is a fair comment on the little volume of 286 pages issued under the above title. It treats briefly on Ferns, their history, culture, and management, and gives a descriptive enumeration of over one thousand species and varieties, together with some of their synonyms. In the matter of nomenclature, the author has experienced the same difficulties which have beset his predecessors in Fern lore, and in the preface he shields himself by saying, "In this little work there is no pretence of the priority of any of the names, as that is open to such conflict among authorities; but the whole names, or synonyms, are to be found in different books under one or other of such names." This is a trifle vague, and it might have been better to have said that the names best known and most generally recognised in gardens had been given precedence, for that is what has been done, and in a work intended for beginners, and which could only deal very briefly with the subject undertaken, wisely too. At all points the little work shows that the author is one who has a great liking for Ferns, and has passed an observant time cultivating and studying them. The present issue is advanced as a "cheaper edition," and on those terms probably many amateurs of Ferns may buy it.

Tomato and Fruit Growing†

Most of our readers will have read in these columns some accounts from time to time of the doings of the spirited lady horticulturist, Miss Harriman, of her schemes for raising and benefiting her sisters poor in this world's goods, but yet compelled to conform to the common lot of humanity by labouring, in some form or another, for their subsistence. To hold out a helping hand to women of refinement, who may be possessed of good bodily strength and some small lump-sum of money, or who may have an annuity too small for their needs, is the laudable object which Miss Harriman has in view. With this intent she gave lectures at Earl's Court Exhibition in 1893, established co-operative horticultural homes in two or three places by the aid of the little money possessed by the young women for whose benefit they were started; and generally in the press and in other ways has promulgated her ideas, and sought to win adherents to her trading ventures. The plants that she chiefly relies upon for bringing profitable returns are Strawberries, in and out-of-doors; bush fruits, choice varieties of dessert Apples and Tomatos, the last-named more than all others, because their cultivation is very well adapted to the capacity of women, no work too hard for them to perform being called for; moreover, it is a profit-producing plant all the year round, more so even than the Cucumber. Her booklet of fifty-five pages contains sensible directions in the art of cultivating the Tomato, and a reason is given for almost everything that is to be done. In regard to the employment of women in gardening, Miss Harriman says that remunerative employment may simply be reduced to this definition—"A means whereby a woman may earn sufficient money to provide herself with the three necessities of life—shelter, food, and clothes. If our employment be that of producing food out of the raw material, viz., the land, we largely provide for our own maintenance at the same time." Our fruit and vegetable gardens undoubtedly ought to supply us with one-half of our daily food. Sir Benjamin Ward Richardson, than whom no sounder authority upon hygiene exists, tells us that for health's sake, we should proportion our food thus: One part animal food, and three parts vegetable. The garden supplying the greater part of our needs, but a small part remains to be furnished by the sale of the merchantable produce of the holdings. The book, of course, is written with all the natural bias of the enthusiast, but its teachings and suggestions need not, therefore, be regarded lightly, sound sense and good practical advice permeating the whole.

Edible and Poisonous Mushrooms: *What to Eat and what to Avoid.* By M. C. Cooke, M.A., LL.D. (London: Society for Promoting Christian Knowledge.)

The S. P. C. K. is to be congratulated upon having issued the best and cheapest guide to those fungi which we may safely eat, and to those which we had better let alone, which has ever been published. They wisely put the matter into the hands of the man who is *facile princeps*, and he has done his work admirably. Of course, comparison is courted with the same author's latest previous work on the subject, *British Edible Fungi*, "how to distinguish and how to cook them," published in 1891, at nearly double the price of the present dainty little volume. But one soon sees that, though the illustrations in the previous more ambitious work are better printed and more picturesque, and that the letterpress therein is fuller, the present *brochure* is quite sufficient to be a safe preliminary guide to those who wish to know what they may eat with satisfaction, and what they do well to avoid. The tendency of modern experience is to find out that the number of actually poisonous fungi is a diminishing quantity. In fact, with proper cooking, and with obvious precautions, there are very few fungi which would have been of any use to that mysterious growth of the middle ages, the insidious poisoner of prominent personages. Here, in a little pocketable volume of only 126 pages, in a pretty cover, with eighteen admirably coloured plates, which are all true to life, and include nearly fifty species, the would-be fungus-eater has at his hand a reliable text-book, showing him how to discern, cook, eat, or avoid almost every species of fungus—call them "toadstools," if you will—which he is likely to meet with in his autumn rambles. Indeed, there are some delicacies, like the Champignon, and the giant puff-ball, and the St. George's Mushroom—to instance but a few, which he may look for at an earlier season. The book contains also a compendium of receipts for cooking the various species in the most attractive and wholesome manner. It is in no way a dry botanical handbook; in fact, its scope is strictly limited to that which is implied by its title. Let us hope that its perusal, and the enjoyment of the delights which it makes it so safe for us to venture upon gastronomically, may lead its readers to go more deeply into the fascinating branch of botanical study to which it is so excellent an introduction:—

> O fortunatos nimium, sua si bona norint,
> Agricolæ, quibus ipsa, procul discordibus armis,
> Fundit humo facilem victum justissima tellus!

Perhaps Virgil was not thinking of fungi; but he might have been. Only those who have made many and wise experiments know how infinitely more delicious many fungi are than even the common Mushroom. And all to be got at no price—but the knowledge and the gathering! *Henry T. Wharton.*

Nursery Notes.

Mr. Armstrong's, Newcastle-on-Tyne.

Within easy distance of the burgh are situated Mr. Armstrong's nurseries. Like all nurseries of note, this is growing in importance every year. The several shops that the proprietor tenants in the ancient burgh have to be fed, and it is wonderful what has been and is being done in the cut flower and plant trade in a town of even 200,000 inhabitants. The demand for flowers is so great among the citizens at large, that notwithstanding the score of large houses filled with ornamental plants of every description, relays have to be taken in to meet the growing demand. This is really a healthy nursery, where the stock is not only well selected, but admirably grown. The large quantities of Roses, and the condition they are in, bear abundant evidence of good returns. The two prominent varieties are Niphetos and Perle des Jardins. The former is in grand condition, covering many hundred feet of roof, and being liberally fed, and in the proper mixtures of loam to begin with, the plants are as near as possible perpetual flowering. The advantage of the Teas over hybrid perpetuals and most other sections is, that they can be grown in a brisk heat, and are not so much subject to the raids of aphides. Moreover, in business houses crops and plants available for general decoration can be grown under their leafy shade. Palms are grown in quantities, and so are Ficus elastica, and Adiantums, and such like.

The great show house was full of well-grown Palms, of which Kentia Belmoreana may be said to be the most useful for decoration. The New Zealand Flax in its variegated form is also useful in this way. The Seaforthia makes a splendid individual for furnishing, but it will not bear cold like the two above-named. Among the Fan Palms there is nothing to equal for hardiness Chamærops Fortunei, although both C. gracilis and C. excelsa make fine subjects; and then Latania borbonica, with its glistening fan-shaped fronds, in one of the most conspicuous and useful. The Tree Ferns are good in fine weather, but under the influence of cold there is a loss of fronds in even the commonest Dicksonias and Alsophilas. However, all that class of plants is employed for furnishing purposes, and forms a splendid background for plants which may be in flower at the time. Pelargoniums are largely grown, and are produced in excellent character. There are thousands of Arums which come in so usefully in many ways.

In one of the large houses the back wall has been fitted with pockets, out of which Adiantum cuneatum and A. gracillimum spring and keep giving quantities of fronds for cutting purposes. In this way, when you have plant after plant of them nestling among the brick facings, and sending their roots in and amongst every interstice, you have indeed a crop which no system of potting and growing upon stages can at all approach. And then, too, such plants soon grow and diffuse seed, and produce abundance of youngsters to prick out into other quarters. There does not seem to be an over supply of this useful Fern in any establishment we have yet seen, and it is one of those species that will always command a marketable price. The Asparagus, in its several varieties, is much appreciated, more so, indeed, than the Maidenhair, but there is a demand for both. Here, this article is also grown in large quantities, and the climbing branches, run up on cords, come in grandly for decoration. Of course, the fronds of the Fern are more fugacious, but if these plants be grown cool and the fronds properly matured, they will endure, not the atmosphere of ball-rooms certainly for personal decoration, but in the glasses several weeks with care.

Eucharis amazonica still holds the field among all its *confrères*, and although comparatively formal, it always remains a favourite with the ladies. How different with the poor unfortunate Camellia, which has now to be relegated to glasses, smothered up with other things, or about wreaths, to hold a footing at all! Looking to the sturdy health of the Eucharis

* A Manual of Exotic Ferns and Selaginellas, by E. Sandford. (London: Elliot Stock, 62, Paternoster Row, E.C.)

† "Tomato and Fruit Growing as an Industry for Women." Lectures given at the Forestry Exhibition, Earl's Court, during July and August, 1893. By Grace Harriman, practical Fruit Grower and County Council Lecturer. (London: L. Upcott Gill, 170, Strand, W.C.)

plants here, one is apt to set down the want of health one sometimes sees to poverty and to cold combined. The Eucharis like neither of these conditions, and, doubtless, the attacks of the mite, which is so fatal to it, if not entirely due to, are doubtless aggravated by poverty of condition, arising from several causes, and a too cool atmosphere, particularly in winter. Those grand auxiliaries, Pancratiums, are indispensable to a cut-flower concern, and here they are in splendid condition; P. ovatum is still one of the best and most floriferous. Stephanotis, too, is a first-water gem. The best form of it which we saw at Dickson & Co.'s Nursery, Edinburgh, at a recent valuation and inspection case, is worth going miles to see, running along a house hundreds of feet long, and covered all along the parallel lines with many of its wax-looking umbels. The same variety is here—indeed, no other variety is worth growing. We first saw it with our friend, Mr. Malcolm Dunn, Dalkeith, and it is as easily known by the eye from spurious varieties as the white Lapageria from the red, finely-rounded, succulent leaf. The forcing of that admirable white-spiked flower, the Lily of the Valley, is carried on here with great success, the best crowns coming from the Continent, ripened doubtless by the better sunny climate. Large quantities of La tour d'Auvergne Hyacinths are also called into requisition; and no end of the early white and red Rhododendrons, that pay to bring in after being well set and forced into flower.

In addition to the thousands of feet run of glass occupied by plants, there is a large set of vineries, where Grapes are grown, and well grown too; they pay here because there is no middle-man, and then they can be cut and put upon the market fresh every day, or twice a day, or oftener if need be. This is one of the secrets of making things pay. It will not do for private gentlemen, who often have fruit of indifferent quality to put upon the market, and will bring possibly, as Mr. R. D. Blackmore said in the *Times*, only 6*d*. per pound. If growers want a price they must produce the article, and have it to please the eye before it reaches the palate; in this way Mr. Armstrong has the advantage, although he admits that, with it all, there is not a fortune to be made out of it in the best hands. Moreover, in a set of houses such as Mr. Armstrong has, he can have ever so many other things under his Vines, provided he is careful what the things are; and verily the man that has to earn his living by a trade will take care, that is to say if he be in dead earnest, that the auxiliaries do not work mischief with the main article.

In the heating and building of this considerable establishment, Mr. Armstrong has been his own architect both as a joiner and glazier and heating-apparatus constructor. He told me he was trained as a youth at that kind of work, and had as strong a passion for gardening. Beginning in a small way, he has wrought himself up to be not only a successful purveyor, but a man of considerable influence in the district in which he resides. He has constructed his houses suitably for the plants grown therein. He has them all heated from one source, viz., two capacious Trentham saddle-boilers, but doing their heating work well, and like all those horizontal boilers consuming coal of comparatively cheap value. Like most ingenious men, he has a hobby of being able to heat as effectively and as cheaply with boilers set on the surface, as with boilers sunk. We must say, we prefer his present mode, as it is not only extremely difficult to send the heated particles of water down hill, but even on a level. We have a strong opinion upon this point, as we have seen so many futile attempts. Notwithstanding if it were practicable and efficient, it would be a matter of some moment in such places where you cannot have a fall for drainage purposes, from a 6 to 10 feet deep stoke-hole.

The outdoor plants are only limited, the whole available space being almost covered with glass. Pinks and Carnations are grown, and so are Violas, to supply the town trade. The whole place is fully equipped, and the order is unexceptional. *Viator.*

CHRYSANTHEMUM MADAME WALTHER.

THIS is a Japanese variety, the outer florets of which are quilled at the base, the tube expanding into a flat oblong limb. The outer surface of the tube is silvery, the reverse silvery flushed with brown; the tips sulphur-yellow, the inner ones partly incurved, rosy-mauve in colour. A specimen sent us by Mr. Cannell shows how difficult it is to lay down any definite distinctions as to form of florets, for in it there were at least five different forms of florets, with numerous intermediate ones. The general form was that of a raised cushion or disc, surrounded by numerous rows of ray-florets (5) of different shapes. Thus, in the centre were some minute recurved florets, marked 1 and 2 in the illustration (fig. 82), some purple some yellow; next to these are some regularly-formed yellow tubular florets, from which the styles project. These florets constitute the disc or cushion. Outside these come numerous narrow ligulate bronzy-purple florets, recurved at the points (3); and these are succeeded by several rows of bronzy-yellow florets (4) of similar form, but larger, and incurved at the points. These, again, are succeeded by three or four rows of quill-shaped spreading bronzy-purple ray-florets, with an elongated, spoon-shaped blade.

Mr. Cannell tells us that more than one of his plants showed this peculiarity. Doubtless this curious flower shows reversion to more than one of its ancestors, but what induced it to revert is more than we can tell. The illustration shows a longitudinal section through the centre of the flower. The whole flower had the shape of a Turk's-head broom.

HOME CORRESPONDENCE.

FRUIT AND FACT.—I had intended to let Mr. Blackmore's remarks on p. 541, *Gardeners' Chronicle*, November 3, pass without notice, but fearing my silence may be misunderstood, although I am a busy man and unfitted by inclination for a wordy warfare, I will just state a few facts which occur to me as a nurseryman catering specially for fruit growers. If this form of trade does not pay, how is it that not only in Kent, but other counties, where fruit can be grown, that no difficulty exists in letting farms upon which some fruit is planted, where the soil and situation permits of a possible extension? Again, in the forty years I have been in business, my firm must have sold millions of fruit trees. I am unable to recall one single instance, barring Mr. Blackmore's, among the many thousand market growers and amateur growers for sale, in which buyers ever repented of their venture; but I can refer to many hundreds who are so well satisfied that they are year by year increasing their average, as an agent for a Kent property told me, "The fact is the tenants wont be denied, and we must find them fruit trees or they will throw up their farms." As named in the *Gardeners' Chronicle* of November 10, Mr. Francis T. Rivers is fast laying down his older nurseries to fruit for sale, and I gather from him that he is well satisfied with the result; and I am laying down 20 acres of my nurseries to orchard and bush fruit, and shall plant 1000 dwarfs of Cox's Orange Pippin; and I have this year sold approaching 1000 bushels of fruit of various kinds at good paying prices, two or three times more than quoted in your article. I am afraid Mr. Blackmore has been unfortunate all round. Some trade acumen is necessary. The fact remains, that fruit wants no "booming;" the growers know it pays, and the supply of trees has never yet equalled the demand. But the public is very much behind the times as regards the best sorts, and it is the shows that are held which teach them what to buy for use, and what to grow. As regards the final "spat" at my judgment of certain Pears but little known, I am quite prepared to repeat the characters I have given to any fruits, as my remarks are only made after full consideration and trial. If Mr. Blackmore calls Clapp's Favourite (a large and beautiful Pear), synonymous with Précoce de Trévouxe, a small green fruit, either he (or myself), have had them sent to us untrue. Students of the last edition of Dr. Hogg's *Fruit Manual* will not have failed to note that Mr. Blackmore condemns very many Peaches, Pears, &c., that are considered good and even first-rate, and take his remarks *cum grano salis*. It is impossible for our Peaches to be all Noblesse, our Pears all Comice, our Plums all Green Gages, we must have variety. As long as I am permitted to direct the Old Nurseries, Maidstone, I intend to speak of all fruit as I find it (after some years trial) without fear or favour. Early Pears are often left too long on the trees before gathering, and then they rot, or become insipid, but if gathered and stored for a short time they are all that one could wish, e.g., Williams' Bon Chrétien and Jargonelle. *George Bunyard, Maidstone.*

—— Kindly allow me to acknowledge the honour Mr. Blackmore has done me in yours of the 17th, in answer to mine of the 10th; but permit me also to say that I never stated or insinuated that my Pear-tree was planted in 1885, or any other time. I said, "I commenced business" here then—yet he says, "we are almost left to infer" this tree was planted in 1885. So about the Grapes—I stated Mr. Peak said he should be perfectly "satisfied if he could get 1*s*. per lb. for the remainder of his crop," this would rather infer he could not get the 1*s*. Again, I never mentioned anything about sending Pears to market; I said I ground mine to make perry. Covent Garden is not the only corner of the world where money is to be found. It is the last place I should look for it. As to the "amusing" sixpence per bushel, how many thousands of bushels of Apples and Pears have been sold in Hereford and the western counties for 6*d*., and the crop considered a valuable one. I could, a few weeks ago, have shown scores of cottage gardens hereabouts where the Pears were to be had for 6*d*. per bushel, and where the price was thought good and the crop valuable. I never said anything about gathering and packing, they would be shaken down and shovelled up and made into perry. Hundreds of bushels were offered at 2*d*. per bushel under the trees. The Pears are grown for the purpose, and young trees are still being planted. Now, Mr. Blackmore says, his tree of thirty-five years' growth, yields him fifteen bushels of Pears sometimes—suppose the average is ten, that is about what mine is. Now, at 24 feet apart, a good distance for such trees, that is 75 trees per acre, 750 bushels of Pears per acre, and yet he says 200 bushels is a good crop—are then these bushels large? *B. Wells, The Fruit Nurseries, Crawley.*

CRINUM MOOREI.—In regard to Mr. Easter's remarks about the colour of the flower of this bulb, may I mention that in Messrs. Ant. Roozen's catalogue are mentioned two Crinums Moorei—one has a rose flower, price 4*s*.; the other (album) has a white flower, price 8*s*. *W. Anderson, Old Romney Rectory, Kent.*

—— Replying to your correspondent "J. Easter," it is not unusual for Crinum Moorei to throw up two flower spathes. We have, amongst others, two pots containing six bulbs each, which for the last three years have pushed up eighteen, or three spathes to each bulb. The two first spathes push up almost together, the third coming in succession, extending the flowering time to two months. Ours have the soft pink colour. *Old Sneed.*

THE EXHIBITION STANDS AT KENT COUNTY SHOW.—I observe, on p. 603, a note from Mr. J. Douglas, and I feel bound to differ from his interpretation of Regulation 8 of the Kent County Chrysanthemum Society, which resulted in the disqualification of Mr. W. Wells on October 31 for exhibiting cut blooms on boards larger than the metropolitan plan. Regulation 8, as quoted by him, reads, exhibitors are "requested," not "must" or "shall," but simply requested to have their stands made in accordance with the metropolitan plan. This I take to be merely a wish expressed by the committee that exhibitors might be "induced," not "compelled," to use stands of one size for the purpose of maintaining some uniformity in the arrangement. Had the regulation read, "All cut blooms 'must' be shown, or exhibitors 'must' show their blooms on boards of such dimensions," any exhibitor not conforming strictly to such regulation would then have rendered himself liable to disqualification, and the reason for such disqualification would be patent to all. But where the word "requested" is inserted in the place of "must," I maintain that a judge is not called upon to take any action in the matter, nor are the committee entitled to disqualify such an exhibitor for not acceding to their "request." I also think that where the wording of the regulations for exhibitors is in any way vague, the exhibitor should have the benefit of the doubt; and it should be the endeavour of the com-

mittee to word these regulations in such definite language that no two meanings could be placed on them, either by exhibitors, judges, or members of the committee. *Geo. Woodgate, The Gardens, Rolleston Hall, Burton-on-Trent.*

MISCELLANEOUS (NON-COMPETITIVE) TRADE EXHIBITS AT FLOWER SHOWS.—Those responsible for the management of the National Chrysanthemum Society, at the late exhibition at the Aquarium, took a bold, and, as the writer thinks, a commendable step in charging for space occupied by these. Exhibitors, in addition to business done at the shows, or which ultimately follows, get free advertisement in all the gardening periodicals—surely no slight advantage—so that they can well afford to pay for space occupied. Would not payment for space for such exhibits at the Royal Horticultural Society's Temple show be not only a means of bringing grist to the Society's mill, but help to reduce somewhat the, at present, obtrusive trade aspect of those shows? and enable the society to encourage cultural skill amongst gardeners and amateurs, by offering suitable prizes for competition amongst those sections that appear to be somewhat left in the cold in this respect. The principle applied, too, to the Drill Hall meetings would produce a most wholesome effect in many ways, and the medals awarded would have a value they certainly do not possess now. The society need not fear that the trade will not support it, should the hint here thrown out be acted upon. It pays the trade to support the Society. The only effect of the new course of procedure would be that the "support" would be more judicious and less "heavy" than at present. *Justitia.*

THE GENTLEMAN POTATO.—This Potato is fully bearing out the opinions expressed about it when first sent out; indeed, I do not know a variety that has turned out better in every way. "The coming Potato and rival of the Magnum" was predicted of it, and this year it has proved that it is a worthy rival to that excellent variety. Taking the crops generally hereabouts this year, the Gentleman far exceeded in weight of crop and general excellence all others, and in flavour and flouriness when cooked it cannot be beaten. We have this year lifted a crop at the rate of fourteen tons per acre from off land of not very good quality; and the tubers are at the same time free from disease. *G. Ward.*

A CHEAPLY ERECTED FRUIT-ROOM.—It often happens that elaborate, and, consequently, expensive arrangements in the construction of the fruit-room are made in some private gardening establishments. It is quite questionable, however, if they serve any better purpose than the sometimes seen rough-and-ready and much cheaper constructions. These thoughts occurred to one on seeing recently at Orchard Dene, Ealing, what was once a fowl-house transformed into a good fruit-room by the gardener, Mr. C. Long. It has been match-boarded, and about 5 or 6 inches of cocoa-nut fibre placed between the outside and inside boards. The roof is boarded and covered with thick brown paper, brown felt, and then a final covering of tarred felt. It is believed that this will very effectually exclude the frost, and keep the fruit in good condition, indeed, any temperature short of frost does not harm fruit. A cool and even temperature has thus been obtained here in a warm autumn, and it has been found quite warm enough in winter. Pears are not ripening nearly so fast as when kept in an ordinary room previously. Beurré Capiaumont is still good, when in other years it has been over at this date. Means of ventilation are provided. *J. B.*

ARAUCARIA IN SCOTLAND (see p. 603).—At Murthly Castle, where there are some very fine trees of this Pine, I have frequently seen cones containing fertile seeds, and have at present several young plants raised from seed three years ago. *Tom Wylie, Arleywright, Perthshire.*

PEPPERMINT.—On p. 594 you refer to Peppermint culture, and quote from a report by Mr. J. R. Reeve in the *American Agriculturist*. Several times you have inserted letters of mine respecting the cultivation of Peppermint in this country, but of another variety called Mentha arvensis piperascens. I have cultivated this plant for years, having obtained a stock direct from Japan. I introduced it into the United States, and it is largely grown there, and yields splendid crops. It is found to do best in heavy soil. After the crop is cut, and the plants have been manured, a plough goes on either side of the row, and turns the sod right over on to the top of the cut-off stems, so that the effect of the manure is absorbed by the soil. It has been found a good plan to get a crop of Cabbages from this same land. With this variety of Mint we get the Menthol crystals, the demand for which is always considerable, and the price is now 17*s.* per pound, the oil being worth 8*s.* per pound, that is, after the crystals have been taken out. The Americans have up till lately had it all their own way in drying-machines, but now I am glad to say that an Englishman of the name of Robinson has invented and introduced most successfully a beautiful drying apparatus. His first experience was in drying fish in Newfoundland. This is one of the most difficult things to accomplish successfully; but he has now thoroughly introduced this coffee, cocoa, and grain-drying apparatus, and so successful is the system, that one of the London wharves where coffee is dried and the parchment then taken off, has adopted his machine. Another point in its favour is its cheapness. I have had to buy very many American fruit-drying machines, and the price there was about £100, whereas with a £27 machine, superior results can be obtained. I am quite sure that when this machine is better known, it will be largely used for fruit-drying in this country. I send you herewith a drawing of it. [Which we may reproduce shortly. Ed.] One of the difficulties with Mint, for instance, is that it wants drying when it is cut, and it requires cutting just before it flowers. With such a machine as this, the whole of the stems could be dried slowly, and then it would be easy to forward the crop to someone possessing stills, so that the Menthol might be extracted. Up to the present time this has not been the case. I have found a difficulty when cutting the Mint in getting it to the still without its heating. *Thos. Christy.*

PRIMULA VERTICILLATA.—Though usually catalogued among the hardy and more enduring species of this genus, the above plant cannot face with impunity an average English winter, even when given frame protection; indeed, in very severe winters, I have had it killed outright in an unheated house, when at least it was drier than it could possibly have been in the frame. It is therefore advisable to give it a place in the greenhouse during the winter, and under this kind of treatment it is a beautiful plant that continues in flower for a long period of time. So far as soil is concerned, this plant succeeds when potted in the mixture that is found suitable for P. sinensis. The plant has mealy leaves, and whorls of yellow blossoms. Seeds are produced abundantly, and as seedlings make vigorous plants, it is advisable to sow some every year. *J.*

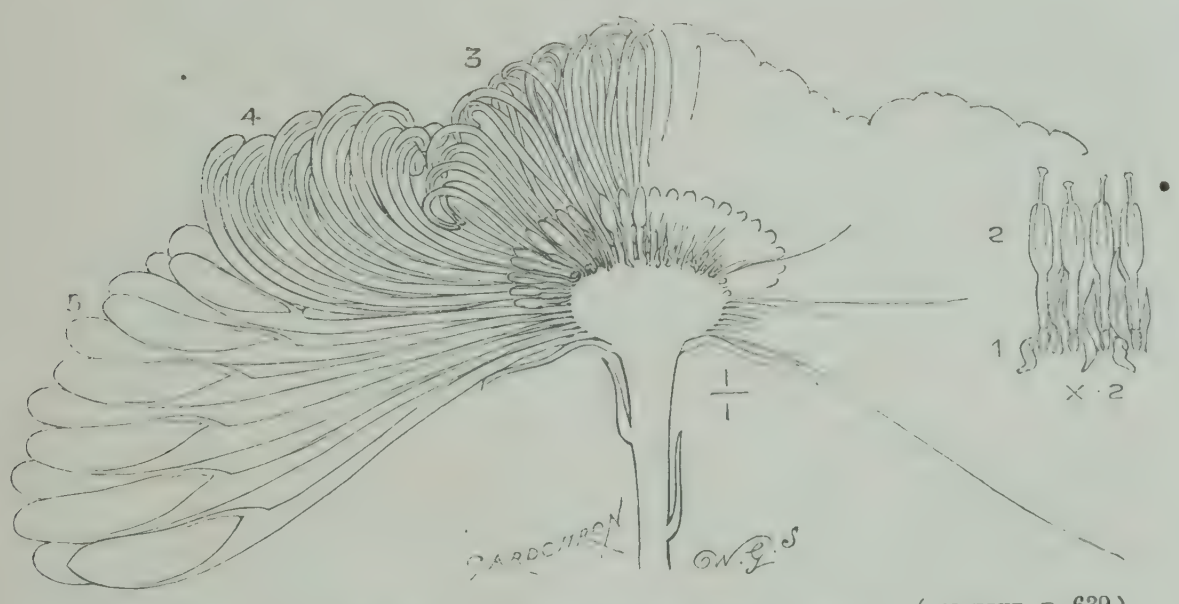

Fig. 82.—POLYMORPHIC FLOWER-HEAD OF CHRYSANTHEMUM MADAME WALTHER. (SEE TEXT, P. 639.)

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

November 13.—Present: A. D. Michael, Esq. (in the chair); Mr. McLachlan, Dr. Bonavia, Professor Müller, Professor Church, and the Rev. G. Henslow, Hon. Sec.

Germinating Black Pepper.—Mr. Henslow exhibited specimens received from Mr. T. Christy, Pepper seeds being usually collected before they are full ripened, are often deficient as to their embryos; but the examples shown had germinated well, the large circular cotyledons carrying up the seed into the air. Their tips formed a club-shaped extremity, and were retained within the embryo sac, usually called the amniotic sac. This apparently acts as a "digestive pocket" by secreting a ferment which dissolves the endosperm occupying the greater part of the seed. This is then conveyed into the plant by the included tips of the cotyledons.

Phenological Observations.—The Secretary, having received the Reports for 1891, 1892, and 1893, from the Royal Meteorological Society, gave some account of an examination of them. The conclusion arrived at was that the first flowering of plants being noticed by one set of observers, and the meteorological data, temperature, rainfall and sunshine (hygrometric data wanting), being supplied by other observers elsewhere, any accurate adjustments between the two, in order to trace out local causes and effects, was next to impossible. Again, although "the observers are required under the new regulations [of 1891] to note each year the flowering of the same individual trees and shrubs, and in the case of herbaceous plants those situated in the same spots" (*Report, &c.*, 1891), yet the observers have not recorded the surrounding conditions respectively to show how far they all agree in any one of the "areas." The problem is thus further complicated, for a plant growing in a warm place may be greatly hastened in flowering, as compared with one in a shady and cool place. Again, plant idiosyncrasies vary greatly: thus, of two Horse Chestnuts, one frequently flowers as a regular feature before others growing side by side with it. Hence, without such and other additional data for strict comparisons, the really scientific value of the phenological observations does not seem to be very pronounced. For horticultural purposes their value is practically none. As illustrations of the above remarks, there are four stations at Salisbury. In 1891 the Coltsfoot flowered at these places from February 15 to March 7, a range of three weeks; at two places at Clifton the Blackthorn flowered on April 26 and May 5 respectively, but there is no clue whereby one can trace the causes of these and other similar differences.

GRIMSBY AND DISTRICT CHRYSANTHEMUM.

November 7, 8.—The fifth annual exhibition of the above Society was held in the Town Hall, and was the best show the Society has yet held. The classes were well filled for cut blooms, and there were some exceedingly well-arranged groups. In the open class for twenty-four Japanese, distinct, the 1st prize was awarded to Mr. Wilton, gr. to J. Ellis, Esq., Grimsby; 2nd, Rev. T. D. Thatcher, Clents Hall, Stourbridge; and in the corresponding class for twenty-four incurved, Mr. J. Walker, gr.

to G. A. Carr, Esq., Waltham Grove, was 1st, and won the National Society's Certificate of Merit also; 2nd, Sir Henry Bennett.

In the amateur classes, A. Mountain, Esq., secured two 1st prizes in good competition. The artisan classes were well filled, showing the increasing interest taken in the neighbourhood in cultivating the autumn Queen.

YEOVIL.

November 13.—The Yeovil Chrysanthemum and Horticultural Society held its ninth annual exhibition of plants, cut blooms, fruits, and vegetables, in the Town Hall, on the above-mentioned date, fine weather prevailing, and it was, taking it altogether, one of the best shows hitherto held by the society. Horticulture is well supported in Yeovil, and there is an excellent show committee, and an able honorary secretary in the person of Mr. E. H. Oakley.

Groups of Chrysanthemums are always well done at Yeovil, and although slight improvements are noticeable in the cultivation and arrangement of the plants staged at each succeeding show, the veteran local grower, Mr. A. Crossman, gr. to J. Brutton, Esq., attains the premier position every year, the plants being admirably grown, furnished throughout with large green leaves, and ranging from 9 inches to 6 feet in height, each stem being crowned by large flowers. Mr. Anthony, gr. to T. Moore, Esq., was a good 2nd this year. Mr. Biss, gr. to Jabez Bradford, Esq., Yeovil, and Mr. Anthony, were 1st and 2nd respectively, for groups of miscellaneous plants with good arrangements.

Cut Blooms.—The eight open classes, as well as those confined to local growers, were well filled. In the class for thirty-six blooms, Japanese, in not fewer than twenty-four varieties, Mr. Copp, gr. to W. E. S. Erle-Drax, Esq., Holdnest, Sherborne, was 1st; and Mr. N. Mose, gr. to J. F. Sampson, Esq., Bridport, a good 2nd. Mr. Copp was also 1st with twelve Japanese, distinct varieties, showing good blooms; Mr. E. C. Tolley, gr. to J. F. Ray, Esq., Throngrove, Gillingham, was a close 2nd. Mr. A. Robertson, gr. to J. S. Doune, Esq., Castle Cary, secured premier position, and the National Chrysanthemum Society's Certificate of Merit, for the best specimen bloom, any variety, with a flower of Mdlle. Thérèse Rey. Mr. Mose had the best six blooms, Japanese, one variety, with Florence Davis; Mr. Crossman, the best half-dozen yellow Japanese, in one variety, with W. H. Lincoln; Mr. Robertson being 1st with six blooms of any other colour, staging fresh blooms of W. H. Tricker.

Incurved Varieties.—Mr. Copp was to the front for twelve blooms, distinct varieties; Mr. F. Dark, gr. to T. E. D. Philpot, Esq., Holm Cleve, Lyme Regis, was a good 2nd.

There were competitive classes for fruits and vegetables, the exhibits of these adding not a little to the attractions of the show.

Trade exhibits of fruit came from Messrs. Robert Veitch & Sons, Exeter; and Messrs. Jarman & Co., Chard. A very fine Bougainvillea, "Coker Court variety," was shown by Mr. Kitley, gardener at Coker Court; it is distinct, and was grandly flowered.

FARNHAM.

November 13, 14.—This show was held in the Corn Exchange, Farnham, a building far better lighted than many places similarly made use of for show purposes at this season.

In the Challenge class (growers for sale excluded), the Cup was awarded to Mr. Gaymer, gr. to Mrs. Anderson, Waverley Abbey, for twenty-four Japanese and twelve incurved; the former were of full and even size, and quite fresh, the best being Thunberg (very fine), Colonel Smith, Boule d'Or, and W. H. Lincoln; the incurved were uniformly good, being of medium size.

Mr. Fry, gr. to Sir Wm. Rose, Moor Park, was 1st in another class for the same number of blooms, good colour and freshness being the chief features, the finest blooms of Japanese being Viviand Morel, Mrs. Falconer Jameson, and W. H. Lincoln, whilst amongst the incurved there were some particularly good blooms. Smaller classes were very well filled, that for six blooms of one kind of Japanese bringing out a fine stand from Mr. Gaymer of Mrs. Alpheus Hardy, in beautiful condition, seldom remarked.

For groups, Mr. Fry was 1st in one class, staging well-grown plants with fine blooms, it being essential that quality should be combined with good effect; and in another contest, Mr. Mortimer, Swiss Nurseries, Rowledge, was an easy 1st, the same conditions being required. In both of these groups an edging of Ferns or dwarf foliage plants would have added to the effect.

Mr. Lye, The Gardens, Sydmonton Court, Newbury, had the best vegetables in two classes.

SOUTHAMPTON.

November 13, 14.—The annual exhibition was held as usual in the Victoria Hall, and, from a horticultural point of view, was a success. For a group of Chrysanthemums arranged for effect in a space of 60 square feet, Mr. J. Hall, gr. to Sir S. Montagu, Bart., M.P., Southstoneham House, Southampton, was an easy 1st with well-grown plants; Mr. E. Rose, gr. to J. H. Alden, Esq., The Firs, Bassett, Southampton, 2nd.

Specimen trained plants were well shown by Mr. Rose in the class for four Japanese, and the same number of any other section. Mr. E. Carr, gr. to U. A. Gillett, Esq., Fairoak Park, Bishopstoke, was a creditable 2nd.

Cut blooms were perhaps the most important part of the exhibition. For Japanese, Mr. Inglefield, gr. to Sir J. Kelk, Bart., Tedworth, Marlborough, won rather easily with medium-sized bright examples of leading kinds. Mr. Agate, nurseryman, Havant, was a creditable 2nd.

Mr. Inglefield repeated his former success by taking leading position for twenty-four incurved, with a stand of clean blooms. Mr. Agate again occupied 2nd place. Mr. N. J. Grace, gr. to W. R. Neave, Esq., Bicton, won for twelve Japanese; Mr. Inglefield being 2nd. The last-named exhibitor had the finest collection of twelve incurved.

Fruit was contributed extensively and well. Mr. Sanders, florist, Andover, had the best three bunches of Grapes in distinct varieties. Mr. Chalk, gr. to G. Read, Esq., Salisbury, the finest Muscat of Alexandria. Pears and Apples were staged creditably by Mr. R. C. West, gr. to H. J. Wigram, Esq., Salisbury, Mr. Hall, and Mr. Amys, gr. to Hon. Mrs. Elliott Yorke, Hamble Cliff, Netley.

Messrs. G. Bunyard & Sons, Maidstone, had a grand exhibit of 200 dishes of Apples and Pears not for competition.

WELLS, SOMERSETSHIRE.

November 14.—The ninth annual Chrysanthemum exhibition of this Society was held on the above date. The grouping of Chrysanthemums showed a decided improvement, and the decision to allow foliage plants to be mixed with them, greatly enhanced the appearance of the groups.

The trained plants of incurved varieties were superb, and cut blooms were a good average. Many growers were prevented from exhibiting, owing to the floods which prevailed to a great extent in the neighbourhood.

The cut flower department was extended to epergnes and bouquets of Chrysanthemums, and there were some admirable and tasteful arrangements exhibited. The exhibits of these latter on this occasion were all excellent, and the judges had some difficulty in making their awards. The neighbourhood abounds with facilities for obtaining many varieties of autumn berries, foliage, &c., and the great variety always exhibited here is uncommon.

Fruit was well represented, Grapes being staged well, and the classes strongly contested. Apples and Pears were fairly good, though there were not so many as usual.

For the best group of Chrysanthemums and foliage plants, the 1st prize went to Mr. Fewtrell, gr. to Mr. C. C. Tuderay, who had included a quantity of well coloured Crotons, Cypresses, Palms, &c., and thoroughly deserved the honour accorded him; 2nd, Mr. Williams, gr. to T. C. Hall, Esq.

The best group, occupying a space of 3 feet by 4 feet, was from Mr. W. Gregory; and Mr. W. Kerslake was 2nd.

For six trained plants of incurved varieties, Mr. Chislett, gr. to S. Austin, Esq., was 1st, with grand plants of Mrs. Dixon, Mrs. George Rundle, Prince Alfred, Lord Wolseley, Geo. Glenny, Mrs. Nash, and Venus. The best six trained plants of Japanese were from Mr. Chislett; 2nd, Mr. H. Moore.

Cut Blooms.—Twelve Japanese and twelve incurved distinct were best staged by Mr. Fewtrell, whose capital stand included (Japanese) Florence Davis, Stanstead White, Etoile de Lyon, Viviand Morel, Silver King, Puritan, and Mdlle. Thérèse Rey. Incurved: Golden Empress, Queen of England, Empress of India, Violet Tomlin, Princess of Wales, S. Coleman, Miss Haggas, J. Doughty, J. Salter, Mrs. Heale, R. Cannell, and Jeanne d'Arc; 2nd, Mr. Williams.

The best twelve incurved, distinct, were also from Mr. Fewtrell, who had a fine lot of blooms; 2nd, Mr. Williams. Twelve Japanese, distinct, were best from Mr. A. Curry, gr. to C. Baily, Esq.; 2nd, Mr. Fewtrell. The best twelve blooms of Anemone flowered, in not less than six varieties, were from Mr. Williams; 2nd, Mr. J. Hall.

The best bloom in the show was a beautiful Lord Alcester, shown by Mr. Williams, which received the certificate of the National Chrysanthemum Society,

A similar award was made to Mr. Chislett for a trained plant of Mrs. Dixon.

Miss Snelgrove was 1st for a stand bouquet, and for a vase or epergne of Chrysanthemums.

For a vase of outdoor autumn foliage, with or without berries, the Hon. Mrs. Wilmot was 1st, and Mr. Walter 2nd. And for a basket of outdoor autumn foliage, Miss Talbot was 1st, and Miss Tyte 2nd.

Amongst fruit exhibits, the best two bunches of black Grapes were from Mr. P. Pain, with very fine Alicantes, well fruited; 2nd, Mr. A. King. For two bunches of white Grapes, Mr. Carpenter, gr. to A. R. Baily, Esq., was 1st, with fine Muscat of Alexandria; Mr. Pain 2nd.

There were small classes for amateurs and cottagers, wherein were very creditable exhibits; there were many honorary exhibits.

READING CHRYSANTHEMUM.

November 14.—Reading may be congratulated upon the fine exhibition of Chrysanthemums it held in the New Queen's Hall on the above date. The show has hitherto been held in the two Town Halls—the old and the new—an arrangement which divided the exhibits and prevented anything like general effect, while the light was always imperfect. The new hall affords space for the whole of the exhibits to be grouped together, it is light and airy, with ample room for locomotion. The arrangements made by Mr. W. L. Walker, the secretary, and his two assistants were excellent. There were several large groups of finely-grown and bloomed Chrysanthemums competing in Class 1, but the appearance would have been greatly improved by a few Palms or Ferns to hide the pots in which the plants stood. The 1st prize went to Mr. F. M. Lonergan, Cressingham Park (gr., Mr. Chamberlain); he had finely-developed Japanese of striking colours, with which were mingled some excellent incurved varieties. The Hon. W. F. D. Smith, Greenlands, Henley-on-Thames (gr., Mr. H. Perkins), was 2nd. So good were the groups that 3rd and 4th prizes, as well as two extras, were awarded.

In the division for smaller groups, Mr. J. W. Hounslow, Down House, Reading (gr., Mr. Goddard), was 1st; and Miss Russell, Reading (gr., Mr. Smith), 2nd.

In regard to specimen plants, Reading has gone back of late years, but the prizes are sufficiently good for better exhibits.

Cut blooms.—These were on the whole good, but the incurved varieties, as is general this season, lacked finish. Mr. F. W. Flight, Cornstiles, Twyford (gr., Mr. Neville), had the best twenty-four incurved, his leading blooms being Violet Tomlin, Miss M. A. Haggas, Princess of Wales, Mrs. Coleman, Lord Alcester, &c. 2nd, Miss J. D. Smith, King's Ride, Ascot (gr., Mr. Lane). With twelve incurved, Sir Geo. Russell, Bart., Swallowfield Park, Reading (gr., Mr. Cole), was 1st, his best blooms being John Doughty, R. Petfield, Violet Tomlin, Lord Alcester, Princess of Wales, and Lord Wolseley. 2nd, Mr. F. Crisp, Friar Park, Henley-on-Thames (gr., Mr. Knowles).

In the amateur's class for twelve blooms, six incurved, and six Japanese, Mr. H. McQueen, Henley-on-Thames, was 1st, and Mr. T. Bedford, jr., Wokingham, 2nd.

Japanese blooms were very good. The best twenty-four came from Sir H. Mildmay, Bart., Dogmersfield Park (gr., Mr. G. Trinder), who had Viviand Morel, Lord Brooke, and Boule d'Or, very fine. Mr. C. Hoare, Hackwood Park, Basingstoke (gr., Mr. Bowerman), was a good 2nd. With twelve Japanese, the Hon. W. F. D. Smith was 1st; Mr. Perkins staging some very finely-developed blooms; and Miss J. D. Smith was 2nd.

Some good blooms of reflexed flowers were shown by Miss J. D. Smith and the Hon. W. F. D. Smith. The class for Japanese incurved resulted in one or two stands of good blooms being disqualified, owing to

inadvertences, but extra prizes were awarded; and the same happened in the case of Japanese reflexed. It is doubtful if it is wise to continue such classes at Reading, as Japanese blooms change so much with development, and every exhibitor has not the catalogue of the National Chrysanthemum Society at his elbow.

Some very fine large-flowered Anemone blooms were shown by Mr. Perkins from Greenlands; Mr. F. M. Lonergan was placed 2nd.

The class for twelve blooms of Japanese, with long stems, is always an interesting one. The best came from Mr. R. Ovey, Badgemore, Henley (gr., Mr. Smith); Mr. C. T. D. Crews, Billingbear, Wokingham (gr., Mr. Ashman), was 2nd.

A tastefully-arranged epergne of Chrysanthemums gained a 1st prize for Mrs. W. L. Walker. The 1st prize for a vase of blooms with the addition of any foliage, went to Mr. W. W. Cowslade, Reading (gr., Mr. Hawkins); Mr. W. T. Abery, Tilehurst, was 2nd. Stands of autumn leaves, flowers and berries, grown out of doors, were very pretty also; Miss L. Phillips was 1st, and Mrs. W. L. Walker 2nd.

Miscellaneous Plants.—These included excellent table plants shown in sizes, berried plants, in all cases Solanums. For tables of zonal Pelargoniums, which were very attractive, the plants being finely bloomed Mr. Alfred Palmer, Reading (gr., Mr. Woolford), was 1st; and Mr. John Hargreaves, Maiden Erlegh (gr., Mr. T. Turton), 2nd. Orchids in couples, a fine pan consisting of Cypripedium insigne and Cattleya amethystoglossa coming from Mr. Perkins; Mr. Knowles coming 2nd, with two admirable specimens of Cattleya labiata.

Poinsettias were very finely shown by Messrs. Turton and Davis, large vigorously-grown specimens with splendidly-developed bracts. Bouvardias were scarcely advanced enough in bloom. Tree Dracænas and Palms were in very fine condition. Richardias were very fine also, Mr. B. Dockerill's especially; and some grandly-developed forms of the pyramidal Celosia gained the 1st prize for Mr. Turton.

Fruit was scarcely up to the Reading mark, and there were evidences that Apples and Pears are not keeping well this season. The Badgemore Alicante Grapes were finely finished, and Mr. Turton's Gros Colmar were fine in berry and bunch; the best bunch of any other black was Alnwick Seedling from Mr. Trinder; and Mr. Lane had some fine white Muscats—indeed, all were good. The best two bunches of any other white were capital Mrs. Pearson, from Mr. Smith, Badgemore.

Of miscellaneous exhibits, Mr. Alfred Palmer had an attractive table of Cattleya labiata; Mrs. Phippen, elaborate table decoration and plants; Mr. Frank Lees, table decorations, plants, and Grapes; Messrs. Cheal & Sons and Geo. Bunyard & Co., fine collections of Apples; Messrs. Holder and Son, a collection of plants; and Mr. W. J. Godfrey and others, cut flowers.

HEREFORD FRUIT AND CHRYSANTHEMUM.

November 14, 15.—This society held its annual exhibition in the Shire Hall, Hereford. Apples and Pears, for which there were some fifty classes provided, formed the chief features of the show. In an open class for 100 distinct dishes of Apples, Messrs. Geo. Bunyard & Co., Maidstone, were 1st, with large, clean, highly-coloured fruit. Amongst the best dishes were Lane's Prince Albert, striped Beaufin, Emperor Alexander, Withington Fillbasket, Cox's Pomona, The Queen, King of the Pippins, Warner's King, New Hawthornden, Lord Derby, Wealthy, and Peasgood's Nonsuch. The latter was a grand dish, and it was selected as the best dish of kitchen Apples in the show. Mr. Watkins, Pomona Farm Nurseries, Hereford, who was a good 2nd, had many dishes equal to the best in the Kentish collection.

Mr. Parker, gr. to Mrs. Evans, Morton Court, was 1st for thirty dishes, having Gascoigne's Seedling, Warner's King, Blenheim Orange, Mère de Ménage, Peasgood's Nonsuch, and Lord Derby, amongst his leading dishes. Mr. Wright, gr. to C. Lee Campbell, Esq., Glewston Court, Ross, was 2nd, with fruit of almost equal quality.

For Pears, twenty-four dishes, distinct, Messrs. Bunyard & Co. were again 1st; Catillac, Marie Benoist, Durondeau, Beurré Diel, Gilogil, Pitmaston Duchess, Beurré Clairgeau, and La Lectier were their largest varieties. 2nd, Mr. Watkins, who had good dishes of Catillac, Glou Morceau, Grosse Calebasse, Marie Benoist, &c.

Mr. Ward was a good 1st for twelve dishes, with Glou Morceau, Easter Beurré, Beurré d'Anjou, Prince of Wales, Marie Louise, Doyenné du Comice, &c. The last-named was a grand dish, and won the prize offered for the best dish of Pears. 2nd, Mr. Parker.

For twenty-four dishes of Apples, including twelve kitchen and twelve dessert, Mr. Davis, gr. to W. E. King, Esq., was placed 1st; 2nd, Miss Boseley, Lyde.

Twelve dishes of Apples, suitable for market, were best from Mr. Parker, and Mr. Dale was 2nd. The best dish of dessert Apples, was one of King of the Pippins, large, beautifully-coloured fruits, exhibited by a farmer, Mr. Dale, The Heven, Burghill.

For a collection of fruit, including six dishes, open to Herefordshire only, Mr. R. Grindrod, gr. to M. Clive, Esq., Whitfield, was 1st, who had excellent Gros Colmar Grapes, good Golden Queen Grapes, Pitmaston Duchess Pears, Adam's Pearmain Apples, Blue Imperatrice Plums, and Filberts; 2nd, Mr. S. T. Wright, with first-rate Gros Colmar Grapes, Ribston Pippin Apples, Marie Louise Pears, &c.

For three bunches of black Grapes, open to Herefordshire only, 1st, Mr. G. F. Morgan, Ledbury Road, Hereford; 2nd, Mr. Grindrod, all showing excellent Gros Colmar.

Lord Llangattock, The Hendre, Monmouth (gr., Mr. T. Coomber), exhibited three very large Pine-apples, which were highly commended.

The groups of Chrysanthemums were excellent, and the best were arranged by Mr. Williams, gr. to Sir J. Pulley, and Messrs. Earp & Son, who were 1st and 2nd in the order named. The cut blooms were also creditable to the exhibitors, the principal prizes going to Messrs. S. T. Wright, J. Lockyer, Pontypool Park; Earp & Son, R. Grindrod, and E. Phillips, gr. to J. M. Bannerman, Wyastone, Leys.

BIRMINGHAM.

November 14, 15.—The thirty-fourth annual exhibition of this horticultural society was held in the Town Hall on the above dates, and was all round a very excellent display, beyond the expectations of all, in the face of the unfavourable weather lately experienced, which was detrimental to the flowers.

The specimen plants were numerous, and better than ever—and Birmingham is celebrated for the specimen plants shown. Mr. O. Braisiere, gr. to Lady Martineau, was 1st for nine large flowering plants, with a very fine lot; Mr. W. H. Dyer, gr. to Mrs. Marigold, being a good 2nd. For six large flowers, Mrs. Marigold was again 1st, as well as 1st for three Japanese.

In the class for large groups, there were six really fine exhibits, the 1st prize falling to Mrs. Marigold for an admirably set up display, and for the quality of bloom. F. Jenkins, Esq., Olton (gr., Mr. R. H. Jones), was a close 2nd; and J. Whitfield, Esq., Moseley (gr., Mr. W. Thomson), was 3rd, with a very fine group; and three other prizes were awarded in this class.

In the class for smaller groups, Mr. Herbert Chamberlain's gardener was 1st with a very pretty arrangement, and four other prizes were awarded.

Heavy prizes were offered for twenty-four blooms of incurved Chrysanthemums, and there were eight exhibits. Mr. Crookes, gr. to the Dowager Lady Hindlip, was 1st, with an excellent lot; S. Loder, Esq., Weedon, 2nd; and four other prizes were awarded.

For twenty-four Japanese, twelve fine lots were staged; 1st, S. Loder, Esq., and 2nd, Mr. Austin, gr., Witley Court. The other classes for cut blooms were also well-filled.

Chinese Primulas for a number of years have been a fine feature at the Birmingham show; and in the open classes Messrs. Thomson & Co., Sparkhill Nurseries, were 1st with fine specimens in the classes for twelve singles, six singles, six double-flowered, and six Fern-leaved, among their newer varieties being Mont Blanc, Duke of York, Fairy Queen, and Princess May; and amongst the Fern-leaved varieties, Her Majesty, and Emperor, were conspicuous. The Right Hon. Joseph Chamberlain's 1st prize twelve Cyclamens were excellent plants.

Some very excellent bouquets were staged by Messrs. Perkins & Son, Messrs. Pope & Sons, and Mrs. Thewles, of New Street Station.

In the class for six specimen Orchids, Mr. J. Palmer, gr. to W. Bown, Esq., Beechams, was 1st, this lot containing a splendid specimen of Lælia Perrini, and a very fine variety of Odontoglossum grande.

In the gentlemans' gardeners' classes for twelve Primulas, as well as six plants, a goodly number of well-grown plants were staged.

Fruit.—Some excellent Grapes were staged. For three bunches of black Grapes, Mr. Elphinstone, gr., Shipton Hall, was 1st, with fine black Barbarossa, and he was 2nd for three bunches of Muscats. Mr. John Bates, gr. to J. T. Harris, Esq., Stone, was 2nd for three bunches of black Grapes, with Gros Colmar. There were eight exhibits in this class for Black Grapes.

For three bunches of white Muscats, Mr. Harman, gr. to the Earl of Denbigh, was 1st; and Mr. Bannerman, gr. to Lord Bagot, was 1st for two bunches of white Grapes other than Muscats.

There was a good display of Apples and Pears, and of good quality generally, also some good Pine-apples.

Miscellaneous.—There was a wonderful display of vegetables, the good quality generally being a surprise to the midland growers. In addition to the Society's prizes, Messrs. Thomson & Co., Messrs. Webb & Co., Mr. Robert Sydenham, and Mr. J. Hughes, gave liberal prizes, and there was a spirited competition in each class.

Honorary exhibits were numerous. Good groups of Orchids were staged by Messrs. Charlesworth & Co., Messrs. Heath & Son, and Mr. William Bown. Two very fine groups of artistic floral work were staged by Messrs. Perkins & Sons, Coventry, and Messrs. Thomson & Co., and the latter firm had an extensive display of fine vegetables, as well as a beautiful group of plants. Mr. Wilkins, gr. to Lady Theodora Guest, sent a fine display of his celebrated Onions; Mr. Hughes, gr. to F. A. Osler, Esq., a superb specimen Cypripedium insigne, to several of which Silver Medals were awarded.

During the first day it rained incessantly, still, there was a large attendance of visitors.

BRISTOL CHRYSANTHEMUM.

November 14, 15.—The thirty-first annual show of this Society was opened on Wednesday, the 14th inst., in the Colston Hall, a place far too small to accommodate the large number of visitors that were present on the second day. In regard to quality, the exhibition was rather better than the high standard generally maintained at Bristol. The first exhibition of the Bristol Amateur Horticultural Society was also held in connection with the larger show, the exhibits of that Society being staged in the arch-room.

One of the principal classes in the schedule of the Chrysanthemum Society was for twenty-four cut flowers of Japanese, and a magnificent collection, staged by Mr. J. Dole, well deserved the 1st honours they received; Mrs. Beddoes, who was 2nd, also showed well in this class. Mrs. Gibson contributed six large-flowered plants on one stem; and was followed by Mr. J. West, of Clifton. Mr. J. Dole, amid spirited competition, was awarded the best exhibitor of a group; and Mr. J. C. Godwin 2nd. There were classes for other and miscellaneous groups of plants, most of which were well contested.

The best collection of twenty-four incurved blooms, in eighteen varieties, was from Sir Chas. E. Phillips, Bart.; and the Right Hon. Lord Justice Lopes was the best exhibitor of twelve blooms of Japanese incurved; Mr. W. M. Baker winning in a similar class, open to amateurs only. Lord Justice Lopes was the principal winner in the classes for twelve blooms of large-flowered Anemone varieties, and for reflexed blooms. Other classes for cut blooms and for miscellaneous floral arrangements were full of interest.

Fruit is usually shown well at this exhibition, and the present occasion was no exception. Successful exhibitors in this section included the Duke of Beaufort, Mr. J. Dole, Mr. V. Stuckey, J. K. D. Wingfield-Digby, Esq., M.P.; H. St. Vincent Ames, Westbury; Mr. W. H. Long, M.P., and others.

Vegetables also occupied a considerable space, and there were numerous first-class miscellaneous exhibits by the trade, that helped greatly to make the exhibition the great success it was.

STOKE NEWINGTON AND DISTRICT CHRYSANTHEMUM.

November 14, 15.—In this district the National Chrysanthemum Society originated, and existed for some time previous to its being held in the Aquarium at Westminster, and to the word National being

substituted for Stoke Newington. For several years past it has been thought that an endeavour should be made to inaugurate another Society, and this has resulted in an exhibition that was held in St. Andrew's Parish Room, on the above dates, under the auspices of the new Society. The exhibition, opened by Mr. Sheriff Hand, who attended in civic state, to perform the ceremony, was a distinct success for a first effort. This was due largely to the Hon. Sec., Mr. L. H. Calcutt, and to the *Stoke Newington Recorder*, in which paper the agitation for a new society originated. There were thirty-six classes, besides a few special prizes, and the former were devoted to members living in the district, amateurs, single-handed gardeners, cottagers, and lady members. There was no entry, however, in those reserved for cottagers, and it is hoped that this will not occur another year.

HULL.

November 14, 15.—The autumn exhibitions of Chrysanthemums at Hull, held in the Hall of the Artillery Barracks this year, have long been recognised as being amongst the best in the Kingdom, and nowhere else is so much enthusiasm thrown into what is the nearest approach to a society started purely for the encouragement of the culture and exhibition of the Chrysanthemum. Not only are substantial prizes offered here, but a very complete method of chronicling the awards as fast as they are made is adopted by the officials. In less than one hour after the last award is made a printed list of the names of all prize-winners and exhibitors is on sale in the building. Nowhere else are seen such groups of Chrysanthemums and foliage plants as are found at Hull. A silver challenge cup, value £20, is offered, together with a money-prize, for a group arranged on an area of 100 square feet. The admission of foliage plants in conjunction with the Chrysanthemums enables exhibitors to show the various purposes to which this autumn-flowering plant may be put with good effect. Six competitors entered this event, and an extraordinarily fine display was the result. The groups being arranged on each side of the hall, every one of them could be readily observed, and there was ample space to get round about them. Mr. G. C. Coates, gr. to W. Wheateley, Esq., Anlaby Road, Hull, was considerably ahead of his rivals with a group that was nearly perfect. The wall was behind the group, clad with Chrysanthemums carrying very fine blooms, and these were contrasted with Palms, Crotons, &c.

Sparingly disposed amongst the variety of other plants were well-grown Japanese Chrysanthemums. Mr. Gledhill Cottam, jur., gr. Alma Gardens, Cottingham, was an excellent 2nd, his chief fault being the flat arrangement of the foliage plants at the back, and some slight degree of crowding in parts towards the front of the group. Mr. A. Pike, gr. to C. H. Wilson, Esq., Water Priory, Pocklington, was a creditable 3rd.

Handsome prizes were offered for a group of mixed plants, covering an area of 100 square feet, and here Mr. G. Wilson, gr. to Sir James Reckitt, Bart., Swanland Manor, Brough, was 1st with a very handsome group for the season. Beautifully-coloured single-stemmed Croton Johannis fully 6 feet high, furnished perfectly with their richly coloured leaves, stood at each corner, the group being a square one. In the centre a well-developed plant of Phœnix sylvestris, the raised base on which it was placed was furnished with well-flowered Calanthe Veitchii and C. V. lutea, standing amidst Ferns and sprays of Asparagus prostrata; placed apart on a groundwork of Moss and Ferns were highly-coloured Crotons in variety. Mr. F. Mason, gr. to A. Smith, Esq., Woodleigh, Hessle, was 2nd.

For three specimens of Chrysanthemums, Mr. H. H. Taylor, Newland Nurseries, Hull, was an easy 1st with well-flowered plants, not too formally trained; Mr. G. C. Coates was 2nd.

For three standard plants, Mr. W. Mason, gr. to Lieut.-Col. A. K. Dibb, Kirk Ella, Hull, won the 1st prize easily with good examples of Mrs. G. Rundle and Mrs. Dixon. Mr. James Backhouse, North Bar Street, Beverley, was 2nd. For six bushes, Mr. W. Goodhill, Trinity Street, Hull, was 1st, with freely-flowered examples; Mr. H. H. Taylor was 2nd. For six "cut backs," Mr. H. H. Taylor had admirably-grown examples, his Viviand Morel being a conspicuously fine example.

Cut blooms were abundantly shown, the quality leaving little to be desired. For twenty-four incurved, in not fewer than eighteen varieties, Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Nottingham, were 1st, winning rather easily with large, fully-developed blooms that were a trifle rough in appearance; Mr. D. Forbes, gr. to A. Holt, Esq., Crofton, Aigburth, Liverpool, was 2nd.

The competition for twelve blooms of incurved brought still more entries, and Mr. W. Lees, gr. to F. A. Beavan, Esq., Trent Park, New Barnet, just succeeded in obtaining the leading position with small but well-finished examples; and Mr. G. Musk, gr. to Lord de Ramsay, Haverland Hall, Norwich, was a close 2nd.

The Japanese varieties were better represented. For twenty-four distinct, Mr. Lees was 1st with ease, he having large, well-developed blooms, quite fresh-looking, and well set up. Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, was 2nd. Mr. Lees repeated his previous success by taking the leading place for twelve Japanese, distinct varieties; Mr. T. Willey, gr. to C. J. Pringrose, Esq., Cottingham Grange, was a very close 2nd.

A capital exhibit was made by four competitors in the class for six bunches of Mrs. G. Rundle, Mrs. Dixon, and George Glenny, three blooms in a bunch. Mr. V. Waterhouse, gr. to H. Witty, Esq., The Wellingtonias, Cottingham, was 1st with exceptionally good blooms of the varieties named, which he had set up with long stems and foliage; Mr. W. Goodhill was 2nd.

Anemone-flowered varieties were well represented. For twelve of the large or so-called show section, Mr. F. Mason, gr. to A. Smith, Esq., Woodleigh, Hessle, was 1st with handsome blooms; Mr. E. B. Burrows, gr. to Sir H. Bennett, Westland, Grimsby, was 2nd.

For twelve Japanese varieties of Anemones there was a spirited competition, Mr. F. Mason being again successful in obtaining the 1st place; and Mr. M. Murchison, gr. to F. B. Grotian, Esq., West Hill House, Hessle, being 2nd.

Mr. Walker, gr. to Col. S. Clitheroe, Hotham Hall, Brough, was 1st for twelve reflexed blooms, shown in not less than six varieties; and Mr. G. B. Burrows was 2nd.

A class was provided for twelve blooms of fragrant varieties, in which Mr. A. Drewrey, gr. to E. Harland, Esq., The Sycamores, Cottingham, was 1st, with nice blooms of Mrs. Langtry, Progue, and Dr. Sharpe; and Mr. Drewrey was likewise 1st for twelve single-flowered varieties, and for Pompons, his exhibits of these varieties being very good.

An interesting exhibit was made by twenty-four Japanese, distinct varieties, cut from the plants, with long stems, the blooms being arranged amongst foliage plants, and stems of small size, the idea being to show what could be done with large blooms of the Chrysanthemum from a decorative point of view. In this competition Mr. J. R. Leadbetter, gr. to A. Wilson, Esq., Tranby Croft, Hull, was easily 1st with good blooms, which he had so arranged that the characteristics of each were well shown, and that without overcrowding the arrangement; Mr. G. Wilson was 2nd for an exhibit whose effect was marred by a too liberal use of Vine leaves of a yellow colour.

Many classes were provided for local cultivators. For twelve Japanese distinct varieties, for which a silver cup was offered in addition to a prize in money, several really good stands of blooms were entered, and Mr. G. Wilson secured the highest award with a very level lot. Mr. G. B. Burrows was 2nd. For a similar number of incurved, Messrs. Wilson and Burrows divided the prizes in the order here given. The premier incurved bloom was Lord Alcester in Mr. Forbes' 2nd prize stand of twenty-four blooms. The best Japanese bloom was one of Mdlle. Thérèse Rey, belonging to Mr. W. Wells. Amateurs staged many excellent stands of blooms. So numerous were the exhibits of table decorations, wreaths, crosses, and bouquets, that a large room had to be set apart for them, which was lighted by gas the whole time, with a view to render the appearance of the table decorations the more effective, and to show the effects of tables so decorated at night. In the former the competition was confined to ladies, and a Challenge Cup, &c., was offered with a money prize as the highest prize. The competitors numbered six, and the display was a charming one. Mrs. Topham, Hotham Hall, Brough, was 1st, with a very pretty table, in which single Chrysanthemums, Eulalia japonica, Smilax, and Ferns played the chief part with some aid from Grevillea robusta as "starers." Mrs. H. L. Leonard, Ivy House, Preston, was a creditable 2nd. She made use of the variety Source d'Or, but placed too much greenery on the cloth.

Bouquets and sprays of Chrysanthemums made a pleasing display. In the former class Miss Judge, Brooklands, Newlands, was the most successful. In the latter Miss Mabel Ayre, The Cottage, Hessle, won the 1st place, both having nice arrangements.

Messrs. H. Cannell & Sons had a fine exhibit of cut blooms, zonal Pelargoniums, and Chrysanthemums, that were much admired.

PARKSTONE CHRYSANTHEMUM.

November 14, 15.—On the above-mentioned dates the Parkstone Chrysanthemum and Horticultural Society held its second annual exhibition of Chrysanthemums, cut blooms, fruit, and vegetables in St. Peter's schoolrooms. The show was exceedingly satisfactory, the extensive schoolroom being well filled. The entries this year were nearly 70 per cent. more than those of last season, which affords ample evidence of the popularity of the Society.

The two leading classes for cut blooms were for twelve Japanese, distinct varieties, and a like number of incurved blooms, distinct varieties, and they were fairly well filled. Mr. C. W. Barrett, gr. to G. J. Fenwick, Esq., Crag Head, Bournemouth, was a good 1st in each class, staging excellent blooms. Amongst non-competitive exhibits, Mr. T. K. Ingram, Parkstone Nurseries, contributed some excellent groups of Chrysanthemums and floral devices in variety; and Mr. G. Grigg, gr. to R. G. Hargreaves, Esq., Cuffnell Park, Lyndhurst, staged two grand bunches of Gros Colmar Grapes, fine in bunch, berry, and finish.

CARDIFF AND DISTRICT CHRYSANTHEMUM.

November 14, 15.—This society may be congratulated upon the success of the show held in the Park Hall, Cardiff, on the above dates, and upon the satisfactory arrangements carried out by the secretary (Mr. Searl). The classes were well filled, and the competition in many instances was close. Cut flowers and groups made an excellent display, and the non-competitive exhibits were numerous and good. Arrangements of cut flowers were exhibited by Messrs. Phelps & Co., Mr. W. Treseder, Messrs. Case Bros., and Mr. Ellis, all of Cardiff.

Messrs. Clibran & Son, Manchester, had a good exhibit, consisting of flowering and ornamental foliage plants, cut Chrysanthemums, Pears, and Apples; while Mr. J. Watkins, Pomona Farm Nurseries, Hereford, contributed a large collection of Apples.

A special Challenge Cup, valued £5 5*s*., offered with prizes in money, for twenty-four distinct Chrysanthemum blooms, was the most coveted prize of the show, and was won by Mr. Dumble, gr. to Sir C. S. G. Phillips, Bart., Picton Castle, Pembroke. The incurves in this exhibit were remarkably good, and one of them (Empress of India) was selected as the best bloom in the show, and gained the National Chrysanthemum Society's Certificate. Mr. Robinson, gr. to R. Harley, Esq., Hereford, was a good 2nd.

For twenty-four Japanese blooms, distinct, Mr. G. W. Drake, Cathays Nursery, Cardiff, was 1st, with beautifully-coloured fresh flowers. Mr. Robinson was again 2nd, with large full blooms, some of which were a little stale.

Mr. Dumble again took the lead for twenty-four incurved blooms, distinct. Empress of India, John Doughty, Queen of England, Lord Alcester, and Miss Lucy Rendel, were very good in this collection. Mr. Williams, gr. to the Earl of Lisburne, Cross Wood Park, Cardiganshire, being a good 2nd.

For twelve Japanese blooms, distinct, Mr. Williams was 1st, with a very good stand, including very large blooms of Waban, Duke of York, Viviand Morel, &c.; 2nd, Mr. Robinson, who also had a good stand.

For twelve distinct incurved blooms, Mr. Robinson was 1st with an even well-coloured lot; 2nd, Mr. Williams.

There were numerous smaller classes, most of which were well filled.

For a group of Chrysanthemums (open), arranged for effect, 10 feet by 6 feet, Mr. W. Treseder, The Nurseries, Cardiff, was 1st. The plants were very dwarf, with plenty of good foliage, and carried large fresh well-coloured blossoms; 2nd, Mr. J. Styles, gr. to Marcus Gunn, Esq., Cardiff, who also had a capital group, with plants somewhat longer in the stems than the 1st prize lot.

The group confined to gardeners and amateurs, 10 feet by 5 feet, brought some good exhibits, and that by Mr. W. J. Hockey, gr. to Col. C. H. Page, Dulwich House, Cardiff, was the best; 2nd, Mr. W. Pinches, gr. to J. P. Hacquoil, Esq., Rumney Hill.

The National Chrysanthemum Society's Certificate for the best plant in the show, was awarded to Mr. Mabbott, gr. to E. Martin, Esq., Dowlais, for a well-cultivated bush plant of Viviand Morel.

Table plants were generally well shown, but there was nothing remarkable exhibited in classes provided for trained Chrysanthemums, Primulas, and Cyclamens. Ferns were, however, shown in very creditable condition. Vegetables and fruit were fairly good.

BECCLES.

November 15, 16.—The fifth exhibition of this Society was held in the Town Hall on the above dates, when an excellent show was made, both as regards quality and number of exhibits; and the competition was very keen.

For Chrysanthemums in pots, Mr. E. Masters and Mrs. Read were the principal exhibitors in the classes for Japanese, incurved, reflexed, and Pompon varieties, the prizes being awarded to the exhibitors in the order named.

In the class for groups, Mrs. Read turned the tables on her formidable opponent, Mr. Masters, who had to take the 2nd place.

Cut blooms were well shown in the various classes. For twelve Japanese, Mr. Newman was 1st, with a fine even lot; and Mr. Sutton 2nd. For twelve incurved flowers, the best were those from Dr. Wilson, Yarmouth. In the classes for amateurs, Mr. W. Aldous, Beccles, was the principal prize-taker for Japanese in pots and cut blooms; and Mr. Sharpin for the incurved and reflexed varieties.

Collections of Roman Hyacinths, Primulas, Violets, Mignonette, baskets of vegetables, fruit, and a very meritorious collection of vegetables from Mr. Batters, Gillingham Hall Gardens (not for competition), made up an excellent show.

WINCHESTER CHRYSANTHEMUM.

November 15, 16.—A capital exhibition of autumn produce was held as usual in the Guildhall—a really good site for such a show. Cut blooms were the feature of the exhibition, no fewer than 1000 being staged. The principal class was that for forty-eight in thirty-six varieties, one half incurved, and the rest Japanese. Mr. N. Molyneux, gr. to J. C. Garnier, Esq, Rooksbury Park, Fareham, was a somewhat easy 1st with a stand of finely-developed specimens, including the bulk of approved new varieties, and the best of the older kinds. Mr. Hughes, gr. to W. Baring, Esq., Norman Court, Salisbury, was a good 2nd.

In the class for twenty-four Japanese, Mr. Agate, The Nurseries, Havant, was easily 1st with a stand containing many new varieties. Mr. C. Holloway, gr. to F. W. C. Read, Esq., Selborne, was 2nd.

Mr. N. Molyneux had the best stand of twelve incurved, and Mr. Hughes was an exceedingly close 2nd. These two exhibitors occupied similar positions for the same number of Japanese distinct.

For six incurved, any one member of the "Queen" family, Mr. Hughes easily beat his opponent, Mr. N. Molyneux, with admirable samples of Lord Alcester. The tables were, however, turned in the class for six blooms of any variety, excluding the "Queen" section, Mr. Molyneux having really grand examples of C. B. Whitnall.

For twenty-four blooms of any section, Mr. Bowerman, gr. to C. Hoare, Esq, Hackwood Park, Basingstoke, won easily, staging a creditable lot of blooms. Mr. Agate had the best Pompons.

Plants made a fine display, Mr. F. Smith, gr. to Lady Wodehouse, Winchester, winning for the best group and for eight specimens. Mr. E. Carr, gr. to W. A. Gillett, Esq., Fairoak Lodge, Bishopstoke, won for four and for two single specimens in all sections, with really good examples of culture.

Miscellaneous plants arranged for effect were a feature. Here Mr. Carr was invincible.

Classes were provided for vases and epergne decorations with Chrysanthemums, foliage, and Ferns, and very pretty they were. Miss Ladhams, Shirley, Southampton, was the most successful, Miss Wadmore, Basingstoke, following.

Grapes well deserve mention. Mr. G. Gardener, gr. to Col. F. Stratton Bates, Twyford Lodge, was invincible in all classes. Amongst others, he staged magnificent examples of Alicante and Gros Colmar.

Vegetables were best shown by Mr. Bowerman.

Non-competitive exhibits added much to the interest of the show. Foremost was a collection of cut blooms of Chrysanthemums in nearly all sections from Mr. Molyneux, gr. to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham.

Mr. E. Hillier had a really fine exhibit of shrubs, plants, and hardy fruit. Mr. Jeffrey had also miscellaneous plants.

SCOTTISH HORTICULTURAL.

November 15, 16, 17.—The Scottish Horticultural Society opened its annual three days' exhibition of Chrysanthemums, fruit, &c., on Thursday, the 15th inst., in the Waverley Market, Edinburgh. This large building was well filled with plants and cut flowers. The number of entries this year was about 800, the competition in some classes being very keen, the entries for some of the vegetable classes numbering between thirty and forty. The specimen plants were in certain cases remarkably fine, but the number of competitors was small in these classes. Grapes are always well shown at Edinburgh, and were a feature of the fruit classes. The nurserymen's exhibits, local and otherwise, helped to give the market a well-furnished appearance. Mr. Henry Irving, who took part in the opening ceremony, said, in reply to the Lord Provost, he had "never seen a hall more admirably or more beautifully situated for such an exhibition." Miss Ellen Terry, who was also to have been present, was prevented through indisposition, and Mr. Irving said, "I am sure, had she been here, she would say of the Edinburgh Chrysanthemums, in the words of Ophelia, 'That's for remembrance.'"

Plants.

For eight plants of Chrysanthemums in pots, distinct varieties, Mr. D. Cavanagh, gr. to Mr. J. C. Oliver, St. Edwards, Murrayfield, was 1st, with good plants, including Avalanche, W. Holmes, G. Glenny, J. Shrimpton, Annie Cibran, Bouquet de Dame, and W. H. Lincoln, the latter securing the award for the best plant in the show; Mr. J. Holmes, gr., Winton Castle, Pencaitland, was 2nd, with a far less effective lot.

For four pots of Pompons, Mr. W. Pulman, gr. to D. W. Huie, Esq., Hollywood, Collinton Road, Edinburgh, came 1st; Mr. D. Cavanagh 2nd. For four plants of Japanese varieties, Mr. D. Cavanagh was 1st; and Mr. S. Abbott, gr. to C. M. P. Burn, Esq., Prestonfield House, Edinburgh, 2nd. Mr. D. Cavanagh was also 1st for two incurved varieties, one yellow, one crimson, one bronze, and one purple variety. Mr. S. Abbott showed a splendidly-flowered Anemone variety, taking 1st place for one pot; Mr. J. Holmes coming 2nd.

In the amateur classes for specimen plants, the competition was confined to a small number of exhibitors. For two large-flowered Japanese, Mr. R. H. McBean was 1st, with creditable plants; Mr. A. McDougall, Broughton Street, being 2nd.

The usual display of large Palms was arranged along the centres of the tables, Mr. G. Wood, Oswald House, Edinburgh, being awarded 1st prize for three of these; and Mr. A. Bissett, gr. to R. Pattison, Esq., Seacliffe, Trinity, was 2nd. Some well grown Dracænas were exhibited, the 1st place being taken by Mr. A. Crichton, Liberton, with well coloured plants. Primulas were numerous, and had a very pretty effect.

For eight decorative foliage plants, confined to 9-inch pots, Mr. T. Lunt, gr. to Archibald Stirling, Esq, Keir, Dunblane, with small but evenly-grown plants, was 1st; and Mr. A. Crichton, gr. to Mrs. Croall, Southfield, Liberton, 2nd.

For six Primula sinensis, Mr. M. Macintyre, gr. to Sir Charles Tennant, The Glen, Innerleithen, took 1st prize.

Primula obconica was shown remarkably fine, the plants carrying a mass of flower; Mr. R. Staward, gr. to J. Cockburn, Esq., Glencorse House, Milton Bridge, was 1st; Mr. M. Macintyre 2nd, the last-named exhibitor having the only exhibit of zonal Pelargoniums.

The groups of Chrysanthemums, arranged for effect, brought only two entries. The 1st prize lot, from Mr. D. Jardine, containing some good blooms of Florence Davis, Mons. Bernard, Stanstead White, Etoile de Lyon, Avalanche, Mrs. J. Clarke, and others, interspersed with Palms and Ferns, making an effective group; Mr. G. Wood was 2nd with a good group, but of smaller flowers.

Cut Flowers.

As might be expected, these classes were the chief centres of interest, flowers of all the leading varieties being found upon the boards of the different exhibitors. In the class for forty-eight Japanese, the 1st prize for which is a Cup, valued at £20, eight entries were made, the successful competitor being Mr. J. Beissant, Castle Huntly, Longforgan, and the exhibit was a thoroughly good one. Amongst his best blooms might be noted Charles Davis, Madame Thérèse Rey, Sunflower, Miss Terry, W. Seward, Florence Davis, Lilian Bird, Beauty of Exmouth, Mrs. Hill, G. C. Schwabe, Louise, and Mrs. E. G. Hill; Mr. J. Carruthers, gr. to Mrs. Fleming, Hillwood, Corstorphine, was 2nd, and staged a fine lot, including the best bloom in the show, Charles Davis, for which a prize was awarded.

For the Scottish Challenge Cup, Mr. W. Rutherford, gr. to D. Graham, Esq., Airthray Castle, Bridge of Allan, took premier honours; Mr. D. Airdrie, gr., Larbert House, Larbert, being a good 2nd. In the class for twenty-four Japanese, Mr. D. Alexander, gr. to A. C. Stuart, Esq., Englescarnie, Haddington, was 1st; Mr. T. Dale, gr., to J. Gordon, Esq, Aikenhead, Cathcart, 2nd.

Twelve entries were made for the twelve Japanese, Mr. J. Beissant, being 1st; and Mr. J. Day, Galloway House, Garliestown, 2nd.

Some good blooms were seen in the classes for six distinct Japanese, but several competitors in these classes were disqualified for wrong naming. For six whites, Mr. D. Nicol, Rossie, Forgandenny, was 1st, and also for twelve incurved varieties; Mr. W. Manchline, gr. to A. D. McLeod, Esq., Belsfield, Windermere, 2nd. The 1st prize for six Anemone-flowered was taken by Mr. W. G. Pirrie, Sunderland Hall, Selkirk.

In the nurserymen's class for forty-eight blooms, distinct, Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, was 1st, with a collection including representatives of the different sections; Mr. R. Wood, The Nursery, Carnoustie, was 2nd.

A class for the best hand-bouquet was keenly contested, but in the end Miss Todd, Stoneybank, Musselburgh, was 1st with a very tasteful arrangement.

In the classes for cut blooms, those arranged in vases, three blooms of each variety in a vase, were quite a departure, and certainly the foliage upon the stems seemed largely to take any stiffness from the flowers, at the same time giving a more natural appearance. The first prize for twelve vases was awarded to Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey; Mr. J. Clark, gr. to F. S. Roberts, Esq., Ashley Bank, Langholm, 2nd. For one vase containing twelve blooms, Mr. R. W. E. Murray, Blackford House, Edinburgh, came 1st; Mr. J. Carruthers 2nd. This latter carried off the prize for the three best blooms of new Chrysanthemums not in commerce, with splendid flowers of Duchess of York.

Fruit.

Grapes.—These occupied a good space, the exhibits in some cases being excellent in colour and size of berry. Mr. J. Leslie, gr. to A. Coates, Esq., Pitcullen House, Perth, took 1st place for four bunches, distinct varieties, consisting of Muscat of Alexandria, Gros Maroc, Gros Colman, and Black Alicante; Messrs. D. & W. Kipper being 2nd.

For two bunches of Muscat of Alexandria, Mr. J. Leslie was again 1st, and Mr. A. M. Donald, Dalkeith, 2nd. Mr. T. Lunt brought some magnificent bunches of Gros Colmar, and took 1st place; Mr. A. Young, gr. to Mrs. Swinton, Swinton Bank, Peebles, was 2nd.

Two excellent Pines came from Mr. D. Murray, gr. to the Marquis of Ailsa, Culzean Castle, Maybole; Mr. J. Riddell, gr. to the Earl of Carlisle, Castle Howard, Yorkshire, being 2nd.

Only one entry was made for the collection of twelve varieties of fruit, Mr. D. Murray taking 1st prize.

Apples and Pears were well represented, and looked sound, but lacked colour. For the eighteen varieties of Apples and six of Pears, Mr. J. Day was 1st, followed by Mr. G. Goodfellow, Perth. For six varieties of culinary Apples, Mr. W. Ogg, gr. to Sir Archibald Dunbar, Bart., Duffus House, Elgin, was 1st; and Mr. J. Day 2nd.

Vegetables.

A very fine display of vegetables was staged, and the collections were arranged in good taste. For a collection of thirteen distinct kinds, Mr. D. McBean, gr. to J. C. Cunninghame, Esq., Craigends, Johnstone, was a good 1st, the whole of the collection being good; Mr. J. Harper, Tulliebelton House, Perth, was 2nd. In the collection of six kinds, which were equal in quality to those staged in the larger class, Mr. A. Dickson, gr. to G. Thorburn, Esq., Glenmoriston, Innerleithen, took 1st prize; and Mr. T. Fender, Crieff, 2nd.

For twelve Tomatos, Mr. W. Murray, Polmont, was 1st; Mr. D. and W. Buchanan 2nd. In the class for Leeks, Mr. D. McBean was 1st, with a seedling from his own crossing; and the same exhibitor was 1st for six heads of Celery. In the class for

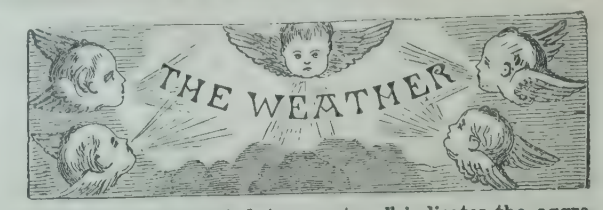
Cucumbers, Mr. W. Murray, Polmont, was 1st; Mr. R. Rae, gr. to Captain Scott Karr, Sunlaus, Roxburgh, 2nd.

Potatos were shown in quantity, and were exceedingly clean and shapely. Mr. J. Gemmell, Flakefield, Chapelton, was 1st; and Mr. A. Murie, Craigmillar Gardens, 2nd. Turnips, Beet, Carrots, &c., were, in all cases, keenly contested by numerous exhibitors, whose produce proved that the season had been a favourable one for vegetable culture.

MISCELLANEOUS EXHIBITS.

Mr. H. J. Jones, Rye Croft Nursery, Lewisham, London, S.E., had a beautiful group of cut Chrysanthemum blooms arranged in vases among Palms, Ferns, and Crotons. Mr. J. Downie, Edinburgh, arranged a display of floral designs, the making up of these showing much taste and skill.

Messrs. R. B. Laird & Sons, Edinburgh, had a pretty table of Ericas, Ferns, Asparagus plumosus, as well as a collection of Conifers in tubs and pots. Messrs. Thyne & Co., of Glasgow, furnished a table with Palms, Ferns, and flowers. Mr. J. Forbes, nurseryman, of Hawick, exhibited the winter-flowering Begonia called Gloire de Lorraine, of dwarf habit, and very floriferous. From Mr. W. Wells, a table of single varieties of Chrysanthemums was admired, amongst the number being also the green-flowered sport from Viviand Morel, named Ethel Amsden. In the interest of the Gardeners' Orphan Fund, Messrs. Todd & Co., had a large stall of mixed plants and other garden sundries.



As showing the great success of the show, it may be added that £770 was taken at the turnstiles during the three days the show was open. With the sale of tickets and the lettings, &c., the yearly income of the society cannot fall far short of £1,000. From 25 000 to 26 000 people visited the show during the three days it was open.

TRADE NOTICE.

MR. WILLIAM EARP, who succeeded the late Mr. E. Cooper, as Gardener to the Right Hon. Joseph Chamberlain, M.P., Highbury, Birmingham, is leaving to take up the active management of the Guildford Street Nurseries, Hereford, of which he is now a proprietor, and the business will be carried on under the title of WILLIAM EARP & SON. His successor at Highbury has been appointed, and Mr. H. A. Burberry retains entire charge of the Orchid department.

Obituary.

WILLIAM CHITTY. — On Thursday evening, November 15, there passed away quite suddenly and unexpectedly, at the age of eighty, Mr. William Chitty, nurseryman, of Stamford Hill, London. Mr. Chitty lived at Stamford Hill the whole of his lifetime, and was in consequence well known and highly respected. Though not in any way seeking notoriety, the deceased was, in many respects, a remarkable man. He was not only a first-rate gardener, but a botanist of considerable attainments. For many years he was the intimate friend and associate of the late Shirley Hibberd, who never failed to call upon Mr. Chitty when he wanted any knotty point in botany solved. Mr. Chitty also did a large amount of the literary work, which passed under the name of Shirley Hibberd, never seeking to push forward his own name. Nevertheless, Mr. Chitty sometimes signed his own name to his writings and whenever he wrote he showed a thorough knowledge of his subject; and his writings were worth reading. Many years ago, Mr. Chitty entered very largely into flower and Fern showing, and was highly successful. He was ever a great lover of Ferns, and exhibited a splendid lot once at the Crystal Palace. Amongst these there was an immense Woodwardia, which met with a great many admirers. Many were the bids for the possession of this Fern, and Mr. Chitty at last parted with it. The Chittys come of an old Wiltshire family, and were possessed of considerable property, but this was lost in the great South Sea bubble, and since then they have had to work for a living. The deceased had a family of three sons and three daughters, one of the sons being a contributor on bee lore to these columns in recent years.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 17, is furnished from the Meteorological Office:—

"The *weather* continued very unsettled and changeable. Extremely heavy rains were again experienced in all except the northern parts of England and the east of Scotland. The periods intervening between the rains were, however, generally fine and bright.

"The *temperature* just equalled the mean over 'Ireland and in England, N.E.,' but continued above in all other districts; the excess ranging from 4° in 'England, S.,' to 1° or 2° elsewhere. The highest of the maxima were registered on rather irregular dates, and ranged from 60° in 'England, S.,' and 59° in 'England, S.W.,' to 53° in 'England, N.W. and Scotland, W.' The lowest of the minima, which occurred also on irregular dates, varied from 30° in 'Scotland, N. and E.,' and 31° in the 'Midland Counties and England, S.W.,' to 37° in 'England, S.,' and to 42° in the 'Channel Islands.'

"The *rainfall* was again less than the mean in 'Scotland, E.,' and but slightly exceeded it in 'England, N.E. and N.W.,' as well as in 'Scotland, W.' In nearly all other districts the excess was extremely large; over all the more south-eastern, southern, and south-western counties of 'England' the fall was nearly four times, and in 'Ireland, S.,' nearly three times as much as the mean. The largest amounts recorded at any individual stations were 6·25 ins. at Godmanstone (near Dorchester), 5·51 ins. at Scilly, 5·13 ins. at Killarney, 4·70 ins. at Falmouth, and 4·60 ins. (in six days) at Crowborough (Sussex). At Scilly as much as 3·06 ins. fell within the first 24 hours of the period, while at Godmanstone 5·74 ins. fell between the 12th and 15th; at several other stations in the south and and south-west, between 3 and 4 inches were recorded during the first three days of the week. Towards the end of the period 2·66 ins. fell at Killarney in 18 hours.

"The *bright sunshine* again exceeded the mean in all districts, the excess in nearly every case being considerable. The percentage of the possible duration ranged from 45 in 'Ireland, N.,' and from between 41 to 43 over central, southern, and eastern 'England,' to 25 in 'England, N.W.,' and to 11 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, November 22.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Supply during the past week rather short. Prices keep firm for all kinds, with a tendency to rise values for the cheaper kinds. *J. B. Thomas.*

SEEDS.

LONDON: *November* 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the most favoured article this week, is American red Clover seed, prices for which show a substantial advance. White seed is now less excited, although the supply continues in very narrow compass. No change in Alsyke. Trefoils and Rye-grasses are neglected. Canary seed is firm. Reasonable quotations now prevail for Hemp seed. Haricots keep strong. Peas are steady. For White Runners there is a brisk demand. Longpod Beans are this season unprecedentedly cheap. Offers of Scarlet Runners are now difficult to obtain; and values are rapidly advancing. There is no alteration in either Mustard or Rapeseed. Linseed is dull.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 128*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 63*s.* to 112*s.*; do., inferior, 36*s.* to 60*s.*; Mixed, 90*s.* to 110*s.*; and Straw, 22*s.* to 38*s.* per load.

Dean Hole in America.—Dean Hole, who is now in America, lecturing on behalf of the Restoration Fund of Rochester Cathedral, has noticed that the American climate is not favourable for the perfect development of the Rose, although under glass some excellent results have been obtained. The Dean has visited all the principal nurseries in the neighbourhood of New York, and has been entertained at a banquet by the Rosarian Society at Everitt House. At Boston, where he lectured, a great display of Roses was made in his honour.

Notices to Correspondents.

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** Plants, Fruits, etc., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Aphis on Cabbage Leaves: *G. A.* We could find nothing on the piece of root, and the specimens in the tube were dead, and mixed up inextricably in the cotton-wool. Probably Aphis subterranea. If you send again, forward a few of both winged and wingless forms in a small glass tube with alcohol. *R. McL.*

Asparagus: *Novice.*—Provided your land is of good quality, and capable of deep tillage, 3 feet from plant to plant is not too great; and if they are planted 6 inches below the surface, no soiling-over will be required for several years after planting; indeed, not before the natural rise of the crown to within 2 inches of the surface makes it necessary that it should be done. When that occurs, it will suffice to draw the mould from between the rows towards the crown, as is done in moulding-up Potatos. There is no need to make beds with deep alleys between, unless the soil is heavy and wet—the worst kind of soil for Asparagus. If the land will bear trenching 2 spits deep, this should be done; 3 spits would be still better. Plenty of manure should be worked into it at different levels, and that placed at the bottom of the trenches may consist of the roughest half-rotten manure, burnt garden-refuse, the remains of crops, and half-decayed leaves—anything, in fact, that will decay in the space of two or three years, or at about the time the roots reach it. You may, as you purpose, plant two-year-old plants, although the cost will be greater than that of one-year. Plant in April.

Aucuba: *M. A. T.* Probably females, but it is quite impossible to say, without the flowers.

Books: *E J. S. The Tomato: its Culture and Uses*, by W. Iggulden, printed and published by Harvey & Woodland, Frome.—*Vines and Vine Culture*, by A. F. Barron, Superintendent of the Royal Horticultural Society's Gardens, Chiswick.—*Fruit Culture under Glass*, by D. Thomson, published by W. Blackwood & Sons, will afford you plenty of useful information on the other subjects that you are interested in.

Chrysanthemums: *H. J. S.* The variety you send us has generally been considered a Pompon, but the sections now overlap each other to a great extent, and exhibitors have to abide by the decision of the National Chrysanthemum Society. In their catalogue the variety Bob is described a Pompon; and more than that, it appears in the Society's selection of the best twenty-four of such varieties. —*F. K.* Judging, as we can only do, from the two detached flowers sent, we are of opinion that they are quite distinct; at the same time, Chrysanthemums are so variable that it is possible the specimens may have come from the same plant!

Correction: Page 592, second paragraph, for 950 Pears, read 150; and for eight Red Currants, read eighty.—Orchid calendar for November 10, top line, middle column: for sheaths, read spikes.

Dendrobium Jamesianum: *R. B. M.* The pseudobulbs have been bored into by a beetle imported into this country along with Orchids. Cut off and burn without delay all stems and pseudobulbs similarly attacked. It is very destructive.

Hyacinths: *D. H.* The bulbs having reached full size, produce their finest bloom, and it is when of this size that the Dutch growers send them to this country; and whether you cut off this bloom when it begins to fade, or let it remain, does not matter much, the next year's bulb will produce a poor flower-spike, or perhaps several, the bulb splitting up into two or three separate bulbs. Of course, you ought not to allow seed to form. If you intend growing Hyacinths for stock, you should scoop out the base of the bulb, leaving the edge from which the roots emerge intact; or you may simply cut the root across at the base in several directions. In either case a number of *round* bulbils will form on the edge the first season, and these should be taken off, and planted in the early autumn. It will, under the best conditions of soil and culture, take three years to grow these bulbils to strong flowering size, the flowers each year being cut as soon as the colour is seen, or even before, if you are sure of the variety. Unless bulbils are obtained in this manner, they never make shapely bulbs.

Mushroom-bed Covered with Another Species of Fungus: *J. F.* A rather peculiar form with conidia of an old trouble, Xylaria vaporaria, so often alluded to, and figured in *Gardeners' Chronicle*, December 20, 1879.

Names of Fruits: *T. S. C.* 2, Huyshe's Victoria; 3, Knight's Monarch; 4, Rouse Lench; 5, Belle de Bruxelles; 7, Winter Redstreak.—*A. C. Y.* 1, Marie Louise; 2, Zephirin Gregoire; 3, Glout Morçeau; 4, Verulam; Beurré Diel; 6, rotten.—*F. World.* 1, Josephine de Malines; 2, Easter Beurré; 3 and 4, Winter Crassane; Apple not known.—*C. R. & Co.* Not very sure of your fruits. 1, Beauty of Kent; 3, Yorkshire Beauty; Pear rotten.—*E. Hall.* Gansell's Bergamot.

Names of Plants: *W. D.* Cosmos bipinnatus.—*A. T. G.* Silybum Marianum, and Carduus Marianus are identical. The Viburnum which bears berries that are red when ripe in September is V. Opulus—snowball tree.—*S. H.* 1, Eriobotrya japonica, Loquat; 2, Leycesteria formosa; 3, Spiræa; the leaves had all fallen.—*C. H. J.* 1, Vanda cœrulea: it may come better; 2, Cotoneaster Simonsii; 3, Cratægus pyracantha Lelandi; 4, Pteris longifolia; 5, Polypodium aureum; 6, Cyrtomium falcatum; 7, Aspidium molle; 8, Berberis Wallichii.—*Wm. W.* 1, Cœlogyne flaccida; 2, Lycaste Deppei; 3, Eupatorium Weinmannianum; 4, Ophiopogon variegatus; 5, Platyloma falcata; 6, the Primula is a singular variety, and if seeded, some distinct and more ornamental things may result.—*S. H.* 1, is one of the American Oaks, probably Quercus coccinea; 2 the seed is that of Entada scandens, which grows in a huge pod like a bean. It is often washed up from the West Indian shores.—*J. W.* Eccremocarpus scaber.

Pear Chaumontel: *G. B.* This variety was found about the year 1685, growing in the garden of the Château Chaumontel, between Luzarches and Chantilly, on the road from Paris to Amiens. *Vide* Dr. Hogg in *Fruit Manual*.

Polygonum sachalinense: *W. R. & S.* It is quite hardy, and will grow vigorously in this country. There are sets to be obtained in this country if you will advertise your wants.

Primula, Origin of, *A. S.* Get the Report of the Primula Conference, 1886, from the secretary, Royal Horticultural Society, 117, Victoria Street. Thank you for 2*s.* transmitted to the Gardeners' Orphan Fund.

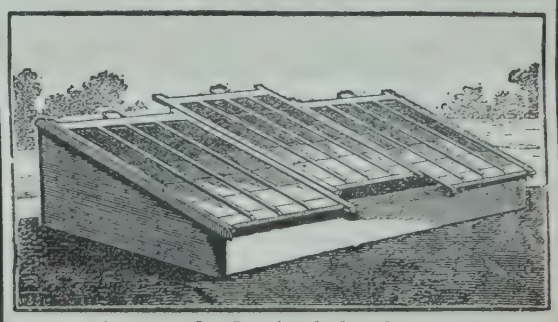
CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*



Increased to the extent of 80 per cent., and that it is increasing weekly.

Advertisers are reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and that it is preserved for reference in all the principal Libraries.*

HARDY BRUIN & CO., Graham Street, LEICESTER

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus, Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

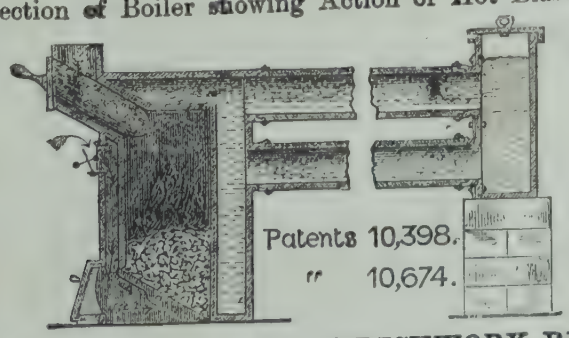
MESSENGER & COMPANY, LOUGHBOROUGH.
London Office:—163, Palmerston Buildings, Old Broad Street, E.C.

IT IS IMPOSSIBLE

To issue a full Catalogue of Chrysanthemums until the flowering season is over. If this is done, many of the best are left out, and many worthless varieties recommended. I have, therefore, issued a Preliminary List, which can be had free on application.

My full Catalogue is in preparation, and will again stand alone as the most perfect and useful Guide up to date. This is not only a Guide which Varieties to select, but will also give treatment, such as size of pot, which bud to take out, and will be invaluable to the Gardener as well as the Amateur. It will also contain beautiful Illustrations of New Varieties, as well as several new features, and

Will be posted to Customers free immediately it is ready.



This is produced at great cost, and not being one of those who can give **SOMETHING FOR NOTHING,** I will forward it to non-Customers, post-free, for seven stamps.

H. J. JONES, RYECROFT NURSERY, LEWISHAM.

SILVER MEDAL HORSE-SHOE BOILER

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Fourteen years' life experience in all branches. First-class testimonials from the best Flower-seeds, Trees, and Vegetable Nurseries, as well as in Outdoors in Denmark, Germany, France, and England, and speaks all four languages (nativity Dane).—Please apply to HANSEN, 1, Maria Terrace, St. James Road, Enfield Highway, Middlesex.

GARDENER, experienced.—Age 34; Churchman, married, no family. Highest references. At liberty when suited. Moderate wages. — GARDENER, Parsonage, West Farleigh, Maidstone.

GARDENER (SECOND, or otherwise).—Mr. LATTER, The Gardens, Park Farm, Sevenoaks, wishes to recommend a young man (age 24). Leaving owing to reduction through death of employer. Ten years' experience, Inside and Out.

GARDENER (SECOND).—Age 25; thirteen years' experience, with good characters.—J. MANSFIELD, Verdley Place, Haslemere, Surrey.

GARDENER (SECOND), in a good Gentleman's place.—Young man (age 21); five years' in present situation. Highly recommended. Abstainer. Good knowledge of Gardening in all its branches.—F. FREEMAN, Gardener, Granville Street, Peterborough.

GARDENER (SECOND), or JOURNEYMAN (FIRST).—Age 23; experienced Inside and Out; good characters from last and previous employers.—F. DOUCH, Denny Bottom, Tunbridge Wells.

GARDENER (UNDER or SINGLE-HANDED), Inside or Out.—Age 23; good character and reference.—W. W., 29, Hyde Close, Winchester.

ORCHID GROWER. — J. CRISPIN, Esq., F.R.H.S., Chester Park, Fishponds, Bristol, strongly recommends a man as above. Experience gained in large collections; first-class grower; now disengaged.

FOREMAN.—I can recommend a young Man to any Gardener wanting a practical hand. Has been in First-class Establishments previous to being here. Particulars from STEPHEN CASTLE, F.R.H.S., Manager, Ashford Vineries, Fordingbridge, Hants.

FOREMAN, in good establishment, or GARDENER, where two or three are kept.—Age 27; over six years' recommendation from one of the largest establishments in the kingdom —CONWAY, The Terrace, Ewell, Surrey

FOREMAN, in the Houses, in large establishment.—Age 29, single; good character from last situations in large establishments as Foreman.—W. WRIGHT, Tilbury Hill, Halstead, Essex.

FOREMAN (INSIDE, or GENERAL); age 26.—Mr. UNDERWOOD, High Firs Gardens, Harpenden, Herts, would be pleased to recommend H. Wright, who seeks re-engagement as above.

FOREMAN (INSIDE, or GENERAL).—Age 28. Mr. G. R. GEORGE, Gardener to Earl Soudes, Lees Court, Faversham, wishes to recommend his late Foreman and Decorator as above. Three years as Foreman previously.—Present address, G. W. RAYMENT, Poles Park, Ware, Herts.

FOREMAN.—Age 24; ten years' experience in good gardens. Well up in Vines, Peaches, Chrysanthemums, &c., for exhibition. Excellent references. Decorations.—E. P., 41, Wellington Street, Strand, W.C.

JOURNEYMAN (FIRST).—Mr. BELLWOOD, The Gardens, Horsley Towers, Leatherhead, can with confidence recommend F. Hampshire, age 25, to any Gardener requiring the services of a good man as above. Five years' excellent character.—Address as above.

JOURNEYMAN (FIRST); age 23.—Mr. HALL, Manor Gardens, North Road, Congleton, would be glad to recommend an exceptionally good all round man for a large establishment. Well up in all branches, especially Fruit and Chrysanthemums.

JOURNEYMAN (FIRST).—Inside, in private establishment. Age 23; eight years' experience in private places and Nursery. Highest references. Mr. A. E. HIGGOTT, Nurseryman and Florist, wishes to recommend a young Man, as above.—G. SEDGLEY, 12, Gordon Villas, Hampton, Middlesex.

JOURNEYMAN (FIRST); age 22. Inside.—G. E. MITCHELL, Head Gardener, Tilgate Forest Lodge, Crawley, Sussex, will be pleased to recommend a young man; six years' experience; good character.

JOURNEYMAN.—Age 21; abstainer; six and a-half years good practical experience. Can be well recommended.—J. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

JOURNEYMAN; Inside preferred. — Mr. EDMUND HANBURY can thoroughly recommend James Allum, age 21, four years' experience; good character, strong, willing, and obliging. Wages expected, 15s. per week with bothy, &c.—E. S. HANBURY, Poles, Ware, Herts.

JOURNEYMAN in Houses.—Age 22; six years Inside and Out; two years in present situation. Excellent characters from past and present employers.—Aspley Gardens, Teddesley, Penkridge, Stafford.

To Gardeners.

JOURNEYMAN, Inside.—Age nearly 19; first-class Fruit and Plant Grower. Good references. Abstainer.—M., 24, William Street, St. John's, Tunbridge Wells.

IMPROVER.—Place wanted by a Youth of 19. Four years' good experience, Inside and Out. Good character from last place. Total abstainer.—F. BEAUMONT, The Central Schools, Bournemouth.

IMPROVER. — Age 18; good testimonial. Three years' experience.—W. WANDBY, Chapel Yard, Hessle.

IMPROVER, under Glass, or in a Florists' Business; or, GARDENER (UNDER).—Age 19; knowledge of Seed and Bulb Trade, two years' experience in each.—A. E. COX, Mr. W. Green, Manea, Cambs.

APPRENTICE. — Wanted, to Apprentice a youth of 18 to the Nursery and Seed Business.—B., 246, Regent Street, W.

TRAINING in HARDY FRUIT CULTURE. —Wanted, by a Young Man (nearly 20), before starting in business. Has had two years' experience as grower under glass. Small salary accepted, or, for exceptional advantages in training, assistance in indoor work given free.—BROOKS, Post Office, Folkestone.

TO NURSERYMEN.—Wanted, a situation in a Market Nursery, well up in Ferns and general pot-stuff. Ten years' practical experience; age 26.—J. B., 33, Harvard Road, Lewisham, London, S.E.

TO NURSERYMEN.—A young man (age 21), seeks situation; Under, Inside Propagator. Five years' experience in general Housework. Good references.—G. FORTUNE, 17, Maria Street, Kirkcaldy, Fifeshire.

STOKER, or General Work in Nursery.—Young man, age 25, married; good character. Bothy preferred.—A. CANFIELD, 1, York Cottage, Cartbridge, Send, Surrey.

ROCK BUILDER, FERNERY FITTER, and HANDY MAN.—Knowledge of Ferns, Aquatics, Fish, &c. Good recent testimonials. — W. J. C., 125, Portobello Road, Bayswater, London, W.

FRUIT, VEGETABLE, and BEE-FARMING. —Experienced man seeks employment.—Apply to H. G., care of Traenhle, Hausser Strasse, Heidelberg Germany.

MARKET SALESMAN, or FERN RAISER, or combined.—Florist's Son requires permanent situation as above; good testimonial.—FERN, 41, Wellington Street, Strand, W.C.

SHOPMAN or ASSISTANT.—Experienced in Seeds, Bulbs, Plants, Cut Flowers, &c. City trade. Good testimonials; competent to manage branch shop.—F. GORTON, 86, Clarence Road, Lower Clapton, N.E.

ASSISTANT SHOPMAN.—Young Man requires situation in good retail Seed Establishment. Seven years' experience; good references. — J. J., Messrs. Nutting & Sons, 106, Southwark Street, London, S.E.

SEED TRADE.—Advertiser, age 21, seeks a situation as ASSISTANT. Five years' experience at Counter, &c. Good references. — A. J. P., Messrs. Robert Veitch & Son, Exeter.

SEED TRADE.—Situation wanted by young Man, age 21; five years' experience. Wholesale and Retail; abstainer; good references.—W. T., 6, Arboretum Street, Nottingham.

SEED TRADE—Young man, age 19, just completed apprenticeship, seeks engagement as CLERK. Most satisfactory references.—F. B., Dicksons' Seed Warehouse, Chester.

TO FLORISTS.—Man, age 24, seeks situation. Life experience under Glass; used to Wreaths and Crosses. Excellent references. London.—C. DENNIS, 13, Boulter Street, St. Clement's, Oxford.

NEWS IS FOOD FOR ACTIVE MINDS, especially in these days of quick communication, when we are enabled within a few hours to know what is taking place at the other end of the world. The merits of HOLLOWAY'S PILLS and OINTMENT, which have been familiar for over half a century amongst all civilised people, have been still more widely spread owing to these facilities. To the natives in the uttermost parts of India, Africa, Australia, and, indeed, to the whole human family, these remedies have been amongst the most precious gifts of civilisation. They cure disease and relieve the most acute pain. In cases of fever, ague, and liver and stomach complaints they are unequalled, whilst for wounds, bruises, sores, &c, they are the best known remedies.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S

PATENT SELF-ACTING HYDRAULIC RAMS,

FOR RAISING WATER FOR THE SUPPLY OF TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, FARMS, ETC.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from **300 to 300,000 gallons per day.** Will force to a height of 800 feet.

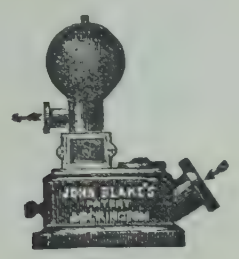

Fig. A.
This Ram raises a portion of the same water that works it.

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 295 feet and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

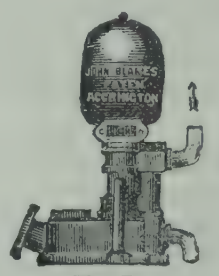

Fig. B.
This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to The Right Hon. LORD HINDLIP.

Bradley, Ashbourse, Derby, March 17, 1894.

DEAR SIR,—Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alsop-en-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than **63 times that of the working fall.** The Rams are worked by water from the River Dove with the small working **fall of 8 feet 3 inches,** and issuing from the rocky bank close by is a copious stream of pure spring-water, **8000** gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of **532½** feet above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to.

Yours faithfully, T. FERNYHOUGH.

From T. DYNE STEEL, Esq., M.Inst.C.E., Past President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon., April 24, 1891.

USK WATERWORKS.

DEAR SIR,—In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 feet, with a working fall of driving water of 27 feet, and on your guaranteeing that performance I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests with the following results: Working fall of driving water, 30 feet; vertical height raised, 127 feet; length of rising main, 850 feet, from Ram to outflow; length of supply pipe, 200 feet; gallons per hour raised, 1612; driving water used per hour, 8186 gallons, showing the remarkable and gratifying result of **83 per cent. of efficiency.** The tests were carefully made and repeated, the water measured, and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject, facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe in order to reduce friction, with excellent effect. Yours faithfully, T. DYNE STEEL.

From the Hon. The Earl of HARROWBY, 44, Grosvenor Square, London, February 21, 1893.

SIR,—I have pleasure in stating that the two Hydraulic Rams, which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 feet from a previously existing mill-pool, the Rams supply reservoirs 168 feet above the brook whence the water is forced, through pipes 1½ miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.

I am, Sir, your very obedient servant, HARROWBY.

From CHARLES HART, Esq., A.M.I.C.E., 3, Avenue Road, Leamington, March 13, 1893.

BRIXWORTH UNION RURAL SANITARY AUTHORITY, EAST HADDON WATER SUPPLY.

DEAR SIR,—Since the opening of these works in May, 1891, the two double-acting "B" Rams supplied and fixed by you have done their work with a minimum of attention, uninterruptedly and satisfactorily. Pure spring water obtained from a gathering-ground on the side of a hill is carried along iron pipes a distance of 548 yards, down to a cistern fixed in the Ram-house. From this cistern it flows to the Rams, which are driven by impure water—drawn from an adjacent brook, with an available fall of 12 feet—and thence by them forced along an ascending delivery pipe, a distance of 1520 yards, to an iron reservoir, at an elevation of 204 feet. From this reservoir mains are laid which supply the hall with its stabling, the rectory, six farm-houses, two dairies, and twenty-four wall-fountains for the villagers' use.

The average daily consumption exceeds 4000 gallons, which one Ram easily delivers, thus exceeding your guaranteed quantity by more than 1000 gallons per Ram per 24 hours. Generally the two Rams are regulated to divide the work between them, but occasionally it devolves upon one only.

If more widely known, this means of supplying villages and small towns with a limited quantity of spring water, forced to a suitable elevation by means of your Rams driven by impure water, would most certainly be more generally adopted.

Yours faithfully, CHARLES HART.

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

SIR,—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only 6*d.* in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off-hand farm has been running three years, and has cost not a penny for repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From inquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water-supply is the greatest possible comfort to me. Yours faithfully, C. PAGE WOOD.

From Sir S. M. MARYON WILSON, Bart., London, Nov. 17, 1891.

SIR,—I have much pleasure in stating that the two "A" Rams you supplied and fixed for me at Searles, on my Sussex estate, have proved a great success, especially when the small supply of driving water is considered, as with a supply of 7 gallons per minute only, they have daily thrown 3000 gallons to a height of 96 feet, and through a service of pipes over a mile in length; and testing them recently (with plenty of driving power) found they lifted 7000 gallons per day.

The economy effected by their use is considerable, as they have entirely superseded a steam pump. S. M. MARYON WILSON.

From MATTHIAS SMITH, Esq., Hill Top Hall, Pannal, near Leeds, January 14, 1889.

DEAR SIR,—I have great pleasure in bearing testimony to the marvellous efficiency of the Ram you fixed here in January, 1888. It is worked by spring water of irregular volume, the dry weather flow being six pints per minute, with which quantity you promised to work the Ram, forcing through 330 yards of delivery pipe to an elevation of fully 144 feet, but out of 5¾ pints per minute, 166 gallons per day are sent up, and out of 2 gallons per minute now flowing through the Ram, 540 gallons per day are delivered at the same height. Considering the extremely small quantity of driving water, I certainly did not expect so grand a result. With every wish that you may get the reward you deserve,

I am, dear Sir, yours faithfully, MATTHIAS SMITH.

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER & SON supply their LARGE, NUT, or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4 mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is **absolutely smokeless**, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

R. TUCKER, The Nurseries, Faringdon, Berks.

CARNATIONS, ROSES, PANSIES, VIOLAS, &c.—Her Majesty the Queen in accepting a water-colour drawing depicting a group of Empress Pansies grown by me for Her Majesty's Gardens at Frogmore, graciously expressed her interest in the details of the industry now being carried on at my Flower and Fruit Farms. This industry, which has recently been reported upon by the Government, has grown to such an extent that it is now the largest of its kind either in England or the Continent.

Any of my Customers ordering plants or trees to the value of £1 1*s.*, will have a copy of the unique painting (size 30 in. by 24 in.), above referred to, sent them free of charge.

"I shall frame the beautiful plate of your 'Empress Pansies.'"—OWEN THOMAS, The Queen's Gardener, Frogmore.

Catalogues now ready, free on application.

CHRYSANTHEMUMS.

Our Varieties and Stock are unapproached.

This is well known by the oldest and most successful growers. As an instance, Mr. Mease and many others are again victorious in the great class with those we supplied last season. This unprecedented prize-winning has continued, with hardly a break, for many years. Vigorous and healthy cutting stock is our specialty, not prizes, &c. We have prepared the finest houses (Come and See), of cut-down un-forced plants months ago, which are now full of the loveliest soft root-cuttings, grown near the glass, ever seen, and will strike at once (while others linger for months), and will certainly ensure success wherever they go.

Send for our CATALOGUE, describing 1000 New and Old Varieties—the best kept Collection in England.

H. CANNELL & SONS,
SWANLEY.

CLIBRAN'S NEW CATALOGUE,

TREES and SHRUBS.—Ornamental, Evergreen, deciduous and flowering, including HOLLIES, CONIFERÆ, &c., in great variety, for all purposes and situations: 6 sorts for 3*s.* or 4*s.* 6*d.*; 12 sorts for 6*s.*, 9*s.*, or 12*s.*; 50 sorts for 21*s.*, 31*s.* 6*d.*, and 42*s*, all our selection.

FOREST TREES, and SHRUBS, and HEDGE PLANTS by the hundred thousand. See Catalogue for sizes and prices.

RHODODENDRONS.—Choice named, 24*s.* and 30*s.* per doz. Azaleas, Hardy Heaths, Skimmias, and other American Plants in great variety. 12 American Plants, our selection, for 4*s.*, 6*s.*, 9*s*, or 12*s.*

HARDY CLIMBING PLANTS (an immense collection).—12 distinct kinds, our selection, in pots, for 6*s.*, 9*s.*, or 12*s.* Jasmines and Honeysuckles, white and yellow, 1*s.* and 1*s.* 6*d.* each; Ampelopsis, 1*s.* and 1*s.* 6*d.* each; Clematis, 1*s.* and 1*s.* 6*d.* each. 12, in 12 fine sorts, our selection, for 10*s.* 6*d.* Ivies, lovely variegated and ornamental-leaved kinds, 9*s.*, 12*s.*, and 18*s.* per doz. Irish Ivy, in pots, 6*s.*, 9*s.*, and 12*s.* per doz.

CHRYSANTHEMUMS.

STERLING NOVELTIES for 1895.

MRS. W. J. GODFREY.

Without doubt the most beautiful Japanese and the purest white variety in existence.

Fully described in CATALOGUE, Post-free.

Miss RITA SCHROETER

Raised by CHAS. C. SHEA, Esq., from whom I have purchased the entire stock.

This variety is the only English-raised Japanese not yet in commerce, certificated at the Grand Exhibition of the N.C.S., on November 7, and it certainly is the most striking novelty of the numerous varieties certificated on that date. The blooms, which are large, may best be described as a glorified "Belle Paule," which it much resembles in colour and markings, but of double the size. Of first-class habit of growth, and an easy "doer" in every respect.

Plants, 7s. 6d. each.

The most reliable Catalogue published, post-free to all.

W. J. GODFREY, EXMOUTH, DEVON.

Gardeners' Chronicle.

SATURDAY, DECEMBER 1, 1894.

WINDOW FERNERIES.

FOR many windows facing northwards, flowering-plants are quite unfitted, the lack of sunshine being against them. Ferns, however, would be precisely in their element with such exposure, and we have a very vivid recollection of a time when our British Fern-hobby was young, our collection small, and space limited, and some two or three dozen plants staged in a basement bay-window, were a constant source of admiration to the passers by. The whole affair was very simple: a plain table stood in the bay, on this a stage of three shelves curved to match the bay, and on these shelves stood the plants in pots, the smallest in front, and the taller-growing ones on the top. As the pots were religiously kept turned always the same way, the best view of course was seen from the window; but the table being mounted on strong castors, it was easy to wheel it backwards into the room, and get at the front for a good view, or readjustment whenever it was necessary. In such arrangements, where no Wardian-case is used, gas is the chief enemy of the plants, and they can therefore only safely be recommended where other means of lighting are adopted, or the gas itself is little used. Wardian-cases, unfortunately, are too apt to cramp the plants, by inducing a luxuriant growth, for which their space speedily becomes insufficient; this is, however, an effect often caused by the ignorance of those who select the plants, small specimens of Ferns being installed which are robust growers, and under the stimulus of close culture, are drawn up in addition, so that a few weeks after installation, they are knocking their heads against the roof in vain efforts to attain their normal height. In this connection, we may assert that although there are scores of charming dwarf varieties of Ferns, which would have ample room under such conditions, we have never seen a collection so housed. Take for instance the Lady Ferns (Athyrium filix-fœmina): there are A. f.-f. crispum, A. f.-f. Edwardsii, A. f.-f. Findlayanum, A. f.-f. velutinum, and A. f.-f. nidicaule coronans, all only about 6 inches high, and of dense growth; while A. f.-f. stipætum only reaches a foot. Among the Buckler Ferns, there are Lastrea f. m. crispa, crispa gracilis, crispa cristata, crispa cristata angustata, ramulosissima, and fluctuosa, all charming little gems of similar dwarf habit. The Shield Ferns afford Polystichum angulare Lyellii, crispatum, parvissimum, and others; while some of the dense-growing plumose forms develop so slowly, that small plants would take a year or two before outgrowing the space at command. Besides these, the Hart's-tongue affords a host of pretty

dwarf varieties. With all these a large Wardian-case, whether inside the room, or, as we often see them outside on the window-sill, where the top-light would be of immense benefit, by preventing them from being drawn, would form a congenial home, but as all that is needed to keep their delicate growths from damage is protection from wind, care should be taken with British Ferns to give plenty of air. Good drainage must also be provided. A good plan is to insert the plants in small pots, marking them with small pieces of stone or burr. They can then be shifted in case of need, but in so doing, keep the plants always with same face to the light, as if turned and twisted about, ugly distorted plants are sure to result.

As the Ferns are perfectly hardy, no heating-apparatus is required, even for the outdoor cases—and, indeed, should not be used, as the unnatural stimulus so given during the resting-period of winter keeps them moving all the time, starts them prematurely early into growth, and renders them in the ensuing season a prey to invincible vermin, induced by a ruined constitution. If exotic Ferns requiring heat be grown, they must be grown alone, and in that case we have found it very easy to warm the case with a coil of 1-inch compo-pipe, run once or twice round it, both ends being brought out, one through the drainage-hole, and the other just above it, and inserted into a small copper boiler holding about a quart, under which, at a little distance from the case, a tiny atmospheric ring gas-burner, kept the whole thing warm, without any trouble, and at scarcely any expense. The bottom of the case is filled up to the level of the pipes with crushed cockle-shells, such as are sometimes used in lieu of gravel; and this is kept thoroughly wet, and the little pots partly buried in it. The boiler we had made by a plumber, but the pipes were adjusted by ourselves. The junction of the smaller outlet pipes with the inside larger ones was effected with india-rubber piping, but they are better soldered. With such a little arrangement as this, anything can be grown; but, from our own point of view, while we have a host of charming little native plants which do not need coddling, it is waste of time and trouble to confine ourselves as we, popularly speaking, practically do, to foreign plants which demand it. However, this is a matter of taste, and we only quarrel with it in as far that the favours are not fairly distributed according to merit. Take among the Ferns we have cited, the Hart's-tongue (Scolopendrium vulgare) alone, whether a case be used or merely a table with shelves, such as we have described, a most delightful little collection might be grown with very little trouble in a single window. We have in our mind's eye a score or two of most varied forms of this species which range from very dwarf ones such as S. v. spirale, S. c. flabellatum, S. v. densum Kelwayii, up to some of the finest frilled forms of S. v. crispum, S. v. c. grande, Wills, for example, which are of full normal size, but of which young plants with six or seven fronds only form handsome specimens in a limited area. S. v. peraferens and bicornutum are oddities bearing thorns and little pockets at the tips of their fronds; and Mr. E. J. Lowe of late years has managed to mix a lot of varieties, tasselled, muricate, and frilled, with others of a dwarf nature, so that there is a veritable host of little curios in existence, if the fancy runs that way. Then again there are the little Spleenworts (Asplenium), A. trichomanes, whether in its common form or in its varietal ones of A. t. incisum, A. t. cristatum, A. t. Harrisii, forming lovely little rosettes if congenially treated. All these plants want is well-drained chinks between stones, and in our own fernery they have literally peopled all the chinks and crevices with their slender-foliaged self-sown offspring. A. viride is very like it, but not in facility of culture, which, indeed, it seems to resent. It is a child of the mountain air and weeping cloud, or it is born amid the streamlet spray, in some rocky limestone crevice, circumstances and surroundings which it is difficult to import into an ordinary dwelling-house. Like its neighbour, the Holly Fern (P. lonchitis), it is a sort of gipsy in its liking for the open, and resents imprisonment. The Bladder Ferns are all pretty in their native haunts, but cannot be recommended for home culture, they all too speedily take on a brown hue, and though they survive year after year, and even thrive, the discoloration is a drawback where the main virtue is fresh viridity. The Oak Fern (Polypodium dryopteris) and Beech Fern (P. phegopteris) do capitally either in cases or in pans in the open room; nothing prettier in their own way can be conceived than well-grown specimens of these. But it must always be borne in mind that we are speaking of north windows, or at any rate, of sunless ones. Of course, in some places where there are deep shady areas, such as Londoners are familiar with, in Finsbury Circus and elsewhere, even south windows are in shade, and there all is congenial. Curiously enough, however, though in this very locality more of the areas have fine specimens of British Ferns, and, in fact, there must be some hundreds round the Circus itself, there is not a single variety, all are the usual wayside weeds, and only about four species are represented out of forty-four, and repeated *ad nauseam*. *Chas. T. Druery, F.L.S., F.R.H.S.*

New or Noteworthy Plants.

ADIANTUM DISSIMULATUM, *Jenm., n. sp.*

Stipites erect, ¾ to 1½ feet long, black, polished; fronds erect, 1 to 1¼ feet long, 5 to 10 inches wide, bipinnate, firmly chartaceous, naked, dark green, consisting of a long central pinnate portion and two to three basal, much smaller, spreading, pinnate branches; rachis and costæ like the stipites; leaflets apart or contiguous, sessile, deltoid-rhomboidal on the central branch, varying to oblong or ovate-oblong in the inferior ones of the lower branches, the terminal elongated; veins free, fine, close, flabellate, repeatedly forked; margins dentate when barren; sori continuous around all but the basal and interior segments.

Bull Head, 3000 feet elevation, Clarendon, Jamaica. Collected by Mr. Hart. Mr. Hart sent me a specimen of this at the time, years ago, that he found it, calling my attention as well to its likeness to A. Kendallii, Jenm., but pointing out features of difference. Both likeness and unlikeness were obvious, but I was unwilling to found a species on a single imperfect frond. Now I have seen a full-grown perfect frond of Mr. Hart's, and have no hesitation. The habit and cutting in both are alike, the separativeness lies in the difference of texture and the shape of the pinnæ. *G. S. Jenman, Demerara, Aug.* 21.

Polygonum baldschuanicum, *Regel.**

This species grows naturally in Eastern Bokhara, Turkestan, at an altitude of 1200 to 1700 mètres, where it was discovered by Albert Regel. According to an account given by Prof. Max Cornu to the National Horticultural Society of France, it is a perennial, with stems 4 to 5 mètres high. The leaves are cordiform or hastate, white or faintly rose-coloured. The flowers are borne in long clusters, which are very attractive, and are succeeded by winged seed-vessels, which are at first white and ultimately deep rose-coloured, and very ornamental. The plant is hardy in the climate of Paris.

* *Polygonum baldschuanicum*, Regel, in *Act. Jard. Bot. St. Petersburgh* (1883), p. 684; Max Cornu, in *Journ. Soc. Nat. d'Horticulture*, September, 1894, p. 528.

Orchid Notes and Gleanings.

LÆLIA ANCEPS.

A photograph, kindly sent by Colonel R. T. Lloyd, Ashton Hall, Oswestry, represents a fine specimen of the highly-coloured "Morada" variety of Lælia anceps, which is in flower at this season. Colonel Lloyd's plant bears ninety-three flowers. It would be a good companion-plant to the large example of the white L. anceps, illustrated in the *Gardeners' Chronicle*, February 10, this year, which flowered in Lord Rothschild's garden at Tring Park.

New Orchids.

The following species are described for the first time by Mr. Rolfe in the October number of the *Kew Bulletin*, p. 361, to which we refer for the full descriptive details:—

Pleurothallis pernambucensis, Rolfe.—A distinct little species, with pale yellowish-green flowers, stained with light rosy-purple. Introduced by Messrs. W. L. Lewis & Co, of Southgate, with Cattleya labiata from Pernambuco.

Dendrobium subclausum, Rolfe.—A brilliantly-coloured and remarkable species, introduced by Messrs. Veitch, of Chelsea. The flowers are ¾ inch long, and of a brilliant cinnabar-orange colour. The lip is suddenly infolded near the apex, and plaited round the denticulate margin, which lies so close to the anther and sides of the column as to nearly close the flower, whence the name given to the species, which is a native of the Moluccas.

Megaclinium pusillum, Rolfe.—A small species, flowered at Glasnevin by Mr. F. W. Moore. It is nearly allied to M. melanorhachis, Rchb. f., and comes from east tropical Africa.

Megaclinium triste, Rolfe.—A very distinct species, allied to M. leucorhachis. Flowers velvetty, quite black, with a few light green markings at the tips. The native country is not known.

Cyrtopera flexuosa, Rolfe.—A very distinct species, which flowered at Kew during the present year. The flowers are white, with a few small purple spots on the petals, and the centre of the lip is light yellow, with numerous deeper purple spots on either side, which are almost suffused into an irregular band. Native of Kilimanjaro, East tropical Africa.

Stanhopea Randii, Rolfe.—A species from the Upper Amazon region, allied to S. eburnea, but smaller. The flowers are ivory-white, with a faint shade of yellow on the lip, and very sweet-scented.

Stanhopea nigripes, Rolfe.—A very handsome species, allied to S. Wardii and S. Ruckeri, though markedly different in the details of the lip. The sepals and petals are yellow, with numerous small purple blotches, and the lip and column whitish-yellow, with many small purple spots. It flowered at Kew in August, but nothing is known of its native country.

Catasetum punctatum, Rolfe.—A new species, introduced from Brazil by MM. Linden, and allied to C. atrovirens. The sepals and petals are pale yellowish-green, with numerous light brown spots. The lip is yellow, and the transverse callus inside of a bright orange colour. The flowers are very fragrant.

Polycynis Lehmannii, Rolfe.—A rather pretty species, which flowered with Sir Trevor Lawrence in August last. The flowers are about 1 inch long, light tawny-brown, spotted with purple, the lip rather whiter, with darker purple spots, apex of column deep purple.

Vanda Roeblingiana, Rolfe.—A strikingly distinct species, introduced from Singapore by Messrs. Hugh Low & Co. It is allied to V. limbata, Blume, but differs from every other in the remarkable shape of the lip, which is suddenly dilated at the apex into a

pair of halbert-shaped lobes. Sepals and petals deep brown, irregularly veined with yellowish-green. The side lobes of the lip are white, streaked with purple, and the front lobe brown, with irregular radiating yellow veins. It is dedicated to Hon. C. Roebling, of Trenton, New Jersey, U.S.A.

CYPRIPEDIUM LAWREBEL

will succeed best if potted in good brown, peat-fibre, and living sphagnum moss, or as some cultivators prefer, a good mixture of turfy-loam and fibrous peat, to which some sphagnum moss should be added to keep the soil more porous, and to allow the roots to push through more easily. The pots, however, should be well drained, as stagnation at the roots is very detrimental to the well-doing of this genus. A temperature similar to that maintained in the Cattleya-house, will be found to suit it admirably, and during the growing season a liberal supply of water is necessary. It must, however never be allowed to become dry, even in the dull winter months, although great care must be exercised in watering. The atmosphere should always be kept in a humid condition, to guard against the attacks of thrips, which, if allowed to become established, will greatly disfigure and injure the plants. The flowers of this plant last for a considerable time in full beauty. *Orchid Album*, vol. xi., part 125.

CYPRIPEDIUM ADONIS.

This beautiful hybrid, "Lady's Slipper Orchid," was raised in the Victoria and Paradise Nurseries, Upper Holloway, about five years ago, and is the result of a cross between Cypripedium Spicerianum magnificum and C. Harrisianum superbum, and which may be noted as being the reverse cross to our beautiful variety of C. Pitcherianum. . . Cypripedium Adonis thrives best with pot culture, and should be placed in well-drained pots, with a compost of good fibrous peat and sphagnum moss; the plants should be well elevated above the rim and fixed firmly, although not rammed in. It succeeds well in the Cattleya-house temperature, and should be treated similar to all other evergreen Cypripediums, and never be allowed to become dry. This beautiful and interesting novelty is quite distinct from anything yet in commerce, but it must not be confounded with the C. Adonis which is reported in the pages of the *Orchid Review* for October, 1893, where it is stated that a plant under this name was exhibited by C. J. Ingram, Esq., of Godalming, as a cross between C. hirsutissimum and C. Curtisii, which must be quite a distinct hybrid from our present subject. *Orchid Album*, vol. xi., part 125.

MASDEVALLIA ROSEA.

THE history of this pretty and floriferous Masdevallia (fig. 83) is exceedingly interesting. It was known to science from dried specimens collected by Hartweg at a great elevation on the Andes of Ecuador, as far back as the year 1842, from which material Dr. Lindley described it in 1845; and still later by the report of Dr. Jameson, Professor of Botany and Chemistry at the University of Quito.

FIG. 83.—MASDEVALLIA ROSEA: FLOWERS PINK, REDUCED.

But it remained for that indefatigable traveller, Mr. F. C. Lehmann, who has made Masdevallias a special study, to reach the high altitude at which the plant grows, and by unremitting care to get it alive over the low-lying country which intervenes between its native habitat and the coast, a journey more dreaded by the collectors of fragile Orchids than all the rest of the voyage. The plant was thus made tolerably plentiful in gardens in 1880. Two characteristics, among other good qualities, caused the plant to be a general favourite, viz., the ease with which it could be grown with success in the coldest house, and the freedom with which it produces its pretty carmine-tinted coral-red flowers. Our illustration (fig. 83), taken from a plant which flowered with Major-General C. B. Lucie-Smith, at The Acacias, Worthing, in July last, and which we saw in that interesting collection (which is grown practically in the open air in summer) in August, gives a good representation of the plant on a small scale, and the remarks of its owner and cultivator, conveyed in a letter on the subject, gives some idea of the manner in which it and others of its class are grown by him. Major-General C. B. Lucie-Smith says:—"The Masdevallia rosea was grown by me in a house where the night temperature during last winter, as a rule, sank to about 40° Fahr., and on one occasion to 36°. Does not its fine blooming now go to prove that the minimum of 50° usually adopted is too high for cool Masdevallias?"

But it should be pointed out, that as stated in our report of his method of growing Orchids in the *Gardeners' Chronicle*, August 25, 1894, p. 217, Major-General Lucie-Smith maintains than his plan of growing Orchids in open-air shelters in summer induces floriferousness, and enables the plants to sustain a lower temperature in winter than would otherwise be the case. *J. O'B.*

FOREIGN CORRESPONDENCE.

FRUIT IN GERMANY.

MANY of the southern parts of Germany are fruit-growing lands, but they are not able to produce all the fruit which Germany consumes. In northern Germany fruit-growing is not so much carried on as in the south, so it is not to be wondered that Germany imports a great quantity of fruits every year. Recently has been issued the report in the *Pomologische Monatshefte*, by Lucas, of the imports into and of the exports from Germany of fruit and fruit-products during the last ten years ending with 1893; and it is interesting to learn from this report that the consumption of fruit is increasing from year to year in a very high degree. There were imported into Germany in 1878—1887, 26,550 tons; 1880—1889, 34,893 tons; 1882—1891, 50,489 tons; and 1884—1893, 87,607 tons. The 87,607 tons of the last period were valued at £831,485 sterling. During this same period Germany exported yearly 21,552 tons of fruits of a value of £323,295, so that there were imported yearly 66,055 tons, of a value of £508,190, more than were exported. Interesting is it to learn from the list that the value of fruits, during the last ten years, was—in 1884, 62,748 tons imported, of the value of £564,750; 1886, 97,391 tons, in value £1,022,600; 1888, 70,339 tons, worth £633,050; 1890, 92,144 tons, of a value of £941,150; 1891, 120,384 tons, of a value of £786,350; 1892, 96,173 tons, of a value of £865,850; 1893, 94,058 tons, of a value of £847,000. The value of a ton of fruit varied between £6 5*s.* in 1891, and £11 18*s.* in 1889. It is remarkable that in 1893, notwithstanding in Germany it was generally a fruitful year, there were imported 94,058 tons, of a value of £847,000. The greater part of the fresh fruit imported into Germany came from Austria, viz., 49·49 per cent. in 1890, 73·15 per cent. in 1891, 31·01 per cent. in 1892, and 49·84 per cent. in 1893. Next to Austria, the greatest quantities came from Switzerland, viz., 37·63 per cent. in 1890, 18·65 per cent. in 1891, 41·33 per cent. in 1892, and 25·15 per cent. in 1893. From Great Britain were imported only about 0·02 to 0·05 per cent. On the contrary, the largest quantities of fresh fruits from Germany go to Great Britain, viz., 20,472 tons in 1890, 17,123 tons in 1891, 6548 tons in 1892, and 10,328 tons in 1893. To all other countries Germany exported 8558 tons in 1890, 6419 tons in 1891, 3798 tons in 1892, and 7559 tons in 1893. But besides fresh fruits Germany imports large quantities of dried fruits: in the last ten years ending 1893, 28,732·4 tons, of a value of £514,860. The exports of dried fruits from Germany amounted in 1892 to 116·6 tons, and in 1893 to 112 tons. The largest quantities of dried fruits came also from Austria and Hungary, viz, 17,022 tons in 1890, 19,609 tons in 1891, 16,091 tons in 1892, and 14,773 tons in 1893. Last year Servia came next with 10,077 tons. Great Britain, with Gibraltar, Malta, and Cyprus, brought to Germany dried fruits, 113 tons in 1890, 38 tons in 1891, and 51 tons in 1892 (the quantity exported 1893 is still unknown). The total imports of fruits (fresh and dried) during the last ten years to Germany, is yearly 116,339·4 tons of a value of £1,346,345, and

*

it is a matter for surprise that such large quantities should still be imported into Germany. There is an enormous area of waste land, which brings not one penny rent to its owners, but which might bring in a high rent if planted with fruit trees. For although fruit-growing has increased in a high degree in Germany during the last ten years, the consumption has increased also, as is shown by the above tables. The net profit of an Apple or Pear tree is reckoned in Germany at between £4 6*s.* 6*d.* and £12 19*s.* 6*d.* during the whole life of the tree, viz., sixty-five years. An association with the necessary capital would earn a good net profit. *U. D.*

Trees and Shrubs.

CUPRESSUS MACROCARPA.

This Monterey Cypress grows into grand trees in Devonshire and Cornwall. The largest I have met with was at Captain Rogers', Penrose, near Helston. At 4 feet from the ground, where the bole was 19 feet round, it branched into six stems, most of which ran up to more than 80 feet. This tree was planted thirty-five years ago. Nurserymen in the south-west of England use this Cypress as a screen from wind, in the form of hedges. It seems to stand clipping well. It would perhaps last longer if the leading shoots were removed with a knife, and the use of the shears were deferred for two or three months. By adopting this plan, the shock to the plants would be less severe than when the pruning and clipping are all done at once. *W. T., Hea Moor.*

Ornamental Trees.

Among the various ornamental trees of medium growth suitable for the pleasure-grounds, Virgilia lutea stands out conspicuously; its handsome bipinnate leaves show to advantage during the summer, but in autumn the plant is magnificent, the leaves on the upper part of the tree being of a beautiful yellow colour, while those on the lower part are green, with here and there a tinge of yellow. The tree seldom exceeds, in England, 20 feet in height. It succeeds well in sandy loam, but the wood must be well-ripened to produce the flowers. Another species of tree that succeeds with us is Dimorphanthus mandschuricus; it has Aralia-like foliage, green in the early stages, but at this season changing to bronze. The heads of white flowers make it a striking contrast to the Virgilia. Another tree which flowers well with us after a warm summer is Paulownia imperialis. Catalpa syringæfolia also flowers well, and is a desirable garden tree. The trees of Liquidambar are beautiful in their autumn tints; they are seldom seen of better colour than at Minley Manor, the peaty gravel soil of the garden evidently suiting them; in strong soils the leaves do not always colour well. Rhus Cotinus, Venetian Sumach, has been very fine, and in early morn when covered with dew it is remarkably pretty. It is out of place planted among other shrubs; the most effective position is on the lawn. *T. H. Slade, Lea Park.*

A TRAVELLER'S NOTES.

(*Continued from p.* 628.)

Wellington, New Zealand, July 9, 1893.—Agathis (Dammara) australis, the Kauri of commerce, yields one of the most famous of the world's woods, affording employment to thousands of men, and its conversion a remunerative return for many hundred thousand pounds of invested capital. Its habitat is confined to the most northern portion of the North Island, the area occupied calculated as likely to pay for working having been estimated in 1885 by the Surveyor-General at 138,470 acres. Though found in small quantities between Whangarei and Auckland, the largest forests lie north of the former, and in order to see such a one being worked, I recently left Auckland for the north. A 230 ton steamer performs the journey in ten hours twice a week. The nearest forest to Whangarei lies 13 miles eastward, and as the roads to others are in parts at this season impassable, I had no choice. The forest in question belongs to a private firm, Messrs. Foote Bros., whose arrangements for the conversion of the timber are most economical and complete. Agathis (Dammara) australis, where found, is usually the prevailing tree, and though the undergrowth is thick, large specimens of other trees are rarely met with. It grows in poor soil, valueless for agricultural purposes after a forest has been cleared. The prevailing undergrowth is usually Astelia trinervis, a Liliaceous plant with long narrow leaves. The tree form of Dicksonia lanata is also often met with, and Adiantum reniforme occurs in profusion on every side. Young trees, when planted in a bush, are distinctly handsome, though they are usually not met with in Nature. Planted in the open, like some other New Zealand plants, they fail to grow. Matured trees attain an average height of 80 to 100 feet, with a trunk 4 to 12 feet in diameter, though individual specimens are known to far exceed these dimensions. Mr. Kirk mentions one a 100 feet high to the first branch, with a circumference of 66 feet; whilst one at Mercury Bay is stated to measure 80 feet to the first branch, and to be 72 feet in circumference. The largest I have met with growing was between 9 to 10 feet in diameter, as straight as a gun-barrel, and for two-thirds of its height without a branch. In the summer months it is, however, only a matter of time to see far larger ones, though in the forest I visited the prevailing size was 6 feet, and under; nevertheless, so thickly do the trees grow, many of larger dimensions are met with in a comparatively small area. Respecting the age this exceptional tree attains, Mr. Kirk estimates a tree of 7 feet in diameter to be 1260 years; the specimen I mentioned as growing at Mercury Bay may be considerably over 2000 years, and one, 66 feet in circumference, not less than 1500 years. The proportion of sap-wood is remarkably small—hollow and defective trees are rare; its durability, as shown by wood obtained from buried forest, &c., thoroughly proved, and its strength excelled by but two or three other trees.

In Mr. Kirk's excellent *Forest Flora*, reviewed in the *Gardeners' Chronicle*, Dec. 14, 1889, p. 695, specialists will find many pages giving full details respecting this tree. The branches are never used, though they often attain a diameter of 2 feet. In passing through that portion of a forest already felled, one often clambers over many such buried beneath many feet of the handsome, broad, glaucous foliage. The bark is thick, and most resinous, the resin exuding freely, and forming solid masses in the forks of the branches, though the quantity thus found is trivial compared with that dug up annually from the swamps now covered, or formerly covered, with Kauri forest.

This solidified resin forms the Kauri-gum of commerce, of which between 1883 and 1887 as much as 30,498 tons were exported, its gross value being £1,598,606. It affords employment to thousands, and is a standing resource for the unemployed, though I fancy few undertake the work if they can obtain any other. It is remunerative, but exceptionally rough work. The gum is largely employed in the manufacture of varnish, and forms an admirable substitute for amber in the manufacture of the mouthpieces of pipes. The timber of the New Zealand Kauri, Agathis (Dammara) australis, is considered by some experts the most valuable in the world for general purposes.

In 1888, a syndicate of Melbourne and New Zealand capitalists purchased the mills, the vast Kauri reserves, and rights of the various companies and private owners in the Province of Auckland, and the Kauri Timber Company, Limited, was subsequently formed with a capital of £1,200,000. The Company acquired twenty-eight mills, 163,000 acres of freehold and 265,000 acres of leasehold (since added to), estimated to contain 1,700,000,000 feet of standing Kauri timber. One of the leading mills is at Auckland, over which Mr. Brood, the manager, was good enough to show me. Here, in the busy season, some 400 hands are employed in every variety of work—on the conversion of large stems, 8 to 9 feet in diameter, to almost every conceivable purpose to which wood can be applied. In the yard of the mill lay several 18-inch square long piles, ordered by the Admiralty; and in the upper floor, 6000 doors of one pattern, made from wood seasoned for two years prior to use, and subsequently left for nine months before export, formed a respectable heap. Such a door costs the builder 9*s.* From the huge size of the branchless trunks, the wood is absolutely without knot or flaw. All is done by steam, even to dovetailing, an operation performed by a small but intricate machine. By this means, so accurate is the work, that errors are literally impossible, and putty unknown throughout the whole mill. Hundreds of saws are constantly at work, from the tall vertical blade with teeth inches long to the minute fret-saw worked by boys. Wheelbarrows, windows, mantelpieces, doors, &c., are turned out wholesale, Mr. Brood claiming the joinery to be second to none.

Specially fine planks, 6 to 7 feet in diameter, are kept in limited quantity for counters, &c., and all "mottled" Kauri, much valued, is put aside. It seems scarcely clear what causes the peculiar wavy bands occasionally met with in the wood. Mr. Brood ascribes it to disease; Mr. Kirk to the growth of the bark not keeping pace with the development of the wood tissue, so that flakes or small portions of bark are enclosed by the sap-wood, become indurated under excessive pressure, ultimately forming dark patches on a light ground. Most of the saw-mills are being worked naturally in or near the Kauri forest; even then the handling of such large stems offers difficulty from the nature of the rough and broken ground it usually affects. Various are the devices by which the huge trunks are brought beneath the "breaking-down" saw.

Where possible, a stream is made use of, often rolling roads have to be formed, and on steep slopes "skids" are the means of transport. Most useful, however, is "the jack," in the use of which the bushmen are well versed. Necessarily laborious as the moving of such large masses of timber must be, it is yet considerably lightened by the dexterity with which this invaluable aid is handled.

Kauri forests have been purchased at from 2*s.* 6*d.* to 5*s.* per acre, but the present price is much higher—in fact, good forests are almost all taken up now. Owing to the depression in Australia, one of the chief if not *the* chief market, the timber now being cut is in excess of the demand, and many mills are closed. Such is the supremacy of the timber for nearly all purposes, this can but be temporary.

Oranges do well in the neighbourhood of Whangarei. I saw one orchard in fine condition. Even as far south as Napier the climate is too cold, though Lemons bear well and are hardier. As a rule, however, the large Oranges from Fiji are greater favourites in the market. Near Whangarei the bush in parts is very rich. I visited a hill—the property of the station-master—and have rarely seen a more luxuriant vegetation.

Libocedrus Doniana—restricted to the northern portion of the North Island—is a Conifer of great beauty in a young state, though I have not met with it in a large state. It is unfortunate we cannot grow it freely, as for horticultural purposes it would prove above the average.

Areca sapida is common, and makes fine trees 20 to 30 feet in height. The pith is said to have formed the staple food of the natives, and the stems have been used in house building. Planted in open spaces it will not do, and when left after a bush clearing, the foliage diminishes to a quarter of its normal size, clear evidence that shade and moisture are among its chief requirements.

Cyathea medullaris grows freely, often attaining a height of 30 feet, though one in particular I have seen was measured and found to be over 50 feet. I think, however, smaller specimens with their gigantic fronds are more impressive. C. dealbata is also at home, though it does not attain a greater height than 12 to 15 feet.

Phyllocladus trichomanoides, "the Tanekaha," is very handsome, and its Fern-like foliage most curious. The wood is valuable and durable, and Mr. Kirk states that in places it is extensively used. As common as any tree in the district, are Corynocarpus lævigata (the Karaka), and Vitex littoralis (the Puriri). The former forms evergreen bushes and trees 20 to 50 feet high, with foliage of the glossiest green often 6 to 9 inches in length, surmounted by panicles of orange-coloured fruit. The latter, a round-headed tree, the foliage reaching in an unbroken curve to within a few feet of the ground, bears broad shiny foliage, with three to five leaflets, and an abundance of dull crimson tubular flowers; a few may be seen even at this season, though the seed, now rapidly changing from green to red, has, as a rule, replaced them. The wood is hard to work, and though excessively durable, is therefore expensive. For ornamental purposes, it will ever hold a front rank amongst New Zealand trees.

Another very handsome tree is Beilschmiedia Tarairi (the Taraire), restricted to the Auckland district. The foliage is massive, 4 to 6 inches long, broadly obovate, and dull green, densely clothing the tree in its young state. It attains the proportion of a good sized tree, and I have met with some 70 to 80 feet high; though, as a shrub, it is almost more

ornamental. Its rich purple Plum-like fruits, 1¼ to 1½ inches in length, are numerously borne at this season, and are of considerable beauty.

Drimys axillaris, the Horopito, or Pepper-tree of the settlers, a tall, ornamental shrub, is common; Alectryon excelsum, the Titoki, is remarkable for its singular fruit, many of which may now be seen. Mr. Kirk describes it as follows: "When ripe it is ½-inch in length, and almost woody, with a flattened crest on the upper portion, terminating in a spur-like prominence on one side; when the seed is ripe the fruit-vessel becomes ruptured transversely, but not along any definite line." The single black seed is encased in a fleshy aril of the richest scarlet—a pretty contrast.

The foliage of Olearia Cunninghami, the Heketara, always stands well out, 2 to 5 inches long, with broadly distant acute teeth, and entirely white beneath. Either as a shrub or small tree it is very distinct in general appearance.

Coriaria ruscifolia, the Tripakihi; Pseudopanax crassifolium, the Horoeka; Knightia excelsa, the Rewarewa, all mentioned in my last letter, are also met with in the bush around Whangarei.

Probably the best known of New Zealand timbers after the Kauri is the Totara, Podocarpus Totara. For certain special purposes it is even superior to its great rival, more especially for marine piles, as it resists insect attacks, to which the Kauri succumbs. In this respect the Totara bears to the Kauri the same relation as the famous Western Australian Jarrah bears to the Karri. Jarrah, I am told, has been tried in New Zealand for marine pile work, but is not found equal to the Totara, a result I can scarcely credit.

I recently met with a few trees of the Totara. It is rarely found in large quantities, and in most districts is all but extinct, so wholesale has been its destruction. The bark is deeply grooved or furrowed, the stem is from 2 to 6 feet in diameter, and the tree from 80 to 100 feet in height. Its chief defect is said to be its extreme brittleness; it is easily split, and no other is used for telegraph-posts in the North Island.

I returned from Auckland by boat to New Plymouth, and thence overland to Wellington. Landslips, owing to the excessive and continuous rain, are common, and twice the journey was thus interrupted, and trains changed. But a few days since a train was caught between two, and the occupants confined part of a day and all one night without food. *James H. Veitch.*

(To be continued.)

FORESTRY.

PROTECTION OF WOODS FROM GALES.

From time to time, and at more or less frequent periods, our woods are devastated by gales of exceptional strength and velocity, and we hear heart-rending accounts of ruined plantations and glutted timber markets. That wind is one of the worst enemies with which the forester has to contend, scarcely requires mentioning, and yet we are probably not far out in saying that any intelligent and effective system of rendering woods comparatively wind-proof, is seldom adopted in Great Britain. The general and most prevalent idea seems to be that the whole matter depends on thinning. Some advocate thick woods in order to exclude the wind, while others favour free thinning so that root and stem may be sufficiently well developed to confer stability and power of resistance. Both of these arguments are sound so far as they go, but in many cases the wind goes further, and exposes their weak points. That thinning is an important matter is beyond question, but it is not everything, and we may briefly glance at the most important points which present themselves in examining this subject.

The injuries caused by gales to individual trees may be of an irreparable, or only of a temporary nature. By an irreparable injury, we mean the overturning of the tree at the roots, or the snapping off of the stem at some point below the crown. A temporary injury may consist in the tearing off of one or more side branches, or the loss of a leader, either of which losses may be remedied by subsequent growth, with or without artificial pruning.

Causes of Uprooting.

Generally speaking, the blowing down of a tree results from one or a combination of three causes: decay of the large roots, a relatively weak root-system, and excessive wetness of the ground. The first-named cause is most frequently responsible for the overturning of large and old trees in parks and hedgerows, and Elm is especially subject to uprooting from this cause. A relatively weak root-system may be occasioned either by its shallowness, or its poor development. A shallow root-system invariably occurs on thin soils with a hard or infertile subsoil. Shallow roots grow on, rather than in, the soil, and no great force is necessary to destroy the equilibrium of a tree possessing such roots. Badly-developed roots usually result from overcrowding or bad health; but it must be remembered that the power of resistance of the roots depends in a great measure upon the shape and height of the tree. Two primary forces act upon a tree during a storm, the one being its own weight exerted in a vertical direction, and the other the pressure of the wind exerted in a horizontal direction, the resultant of the two forces representing the power of resistance necessary for the roots to possess to ensure stability. Now, the equilibrium of a tree (or any other erect cylindrical body) is greatest when the perpendicular from its centre of gravity falls exactly in the centre of its basal area, and this can only occur when the weight is equally distributed round the axis. The wind also exerts so much the more force or leverage upon the roots the higher up the stem it is applied, and the absolute pressure depends upon the surface of stem and branches presented to it. As the stem represents a lever, it is clear that a given amount of pressure on a well-developed but shallow crown on the top of a high stem, will throw a greater strain upon the roots than the same pressure applied to a tree whose branches taper gradually to or near to the ground. In the latter case the centre of gravity is much lower down the stem than in the former, and the tree with a tapering crown more closely approaches to a state of stable equilibrium, and is thus able to dispense with a strong root system, or, in other words, the latter is put to much less strain than in the case of the top-heavy tree. With long slender stems having shallow crowns, another force comes into play besides those already mentioned. This is the momentum which the crown acquires in being swayed to and fro by the wind. The heavier the crown in proportion to the strength and rigidity of the stem, and the greater its height from the ground, so much the greater will be the momentum. This force, however, is not only exerted upon the roots, but also upon the whole length of the stem, and the amount of strain the latter will bear depends upon the toughness and elasticity of the timber. When this force exceeds the resisting-power of the roots, the tree is blown down when it exceeds the breaking-weight of the stem, but not root-resistance; it is snapped off at the weakest point between crown and root. This latter catastrophe frequently occurs in Coniferous woods when a hitherto thick and crowded crop of poles has been severely thinned, and the trees isolated from their neighbours.

The third cause of uprooting, excessive moisture, may be brought about by an exceptionally heavy rainfall preceding a gale, or by stagnant water resting on the surface. In either case, the soft and spongy condition of the soil destroys that intimate adhesion between the soil particles which exist in well-consolidated land, and the roots are easily withdrawn from the matrix in which they are embedded. This form of uprooting is especially to be feared on peaty land, both on account of the low density of the soil, and the great power it possesses of absorbing moisture.

The temporary injuries to which we have alluded most frequently occur to trees with large and wide-spreading crowns, such as hardwoods which have been allowed free space for development. From a purely sylvicultural point of view they are unimportant, and affect the arboriculturist to a greater extent than the forester.

Preventatives.

We may now proceed to see what means are at our disposal for protecting our woods from these injuries. Evidently there are two directions in which we can work: one by increasing the tree's power of resistance; the other, by decreasing exposure to the wind. We have already seen that a tree's equilibrium is greatest when its branches extend equally in all directions round the axis of the stem, and it possesses a conical crown of a fair depth. A very slight acquaintance with the laws of growth will enable one to see that free space for development is necessary in order to obtain trees of this character. But even when obtained, such are by no means ideal timber trees. The aim of the forester is the production of clean and marketable timber, and not the growth of trees best suited to withstand storms. His trees should be clear of large branches for at least two-thirds of their height, and with some species close order during youth is absolutely necessary for this purpose. The growth of storm-defying specimens must therefore be limited to the margins, and greater importance attached to decreasing the actual surface of the main crop exposed to the wind. As the latter always moves in a practically horizontal direction, it is only a vertical or deeply-inclined surface that feels the full force of a gale. In the case of a compact mass of trees, only the outside individuals would present such a surface to the wind. Even these, if fully exposed from the first, will possess a more or less semi-conical outline of crown, and in very exposed situations a gradually inclined plane will be formed from successive rows of crowns for a considerable distance into the wood.

The chief points to be observed, then, in securing immunity from storms are: fairly free thinning during youth round the margins of the wood, never cutting a marginal tree, keeping all parts of the wood free from gaps, avoiding the occurrence of any abrupt differences of level in the horizontal surface of the crowns, attention to drainage and removal of stagnant water, &c.

But as in British forestry mature timber is sometimes felled before it is absolutely decayed, and as the clearing of a large wood cannot be effected at once, it is impossible to avoid gaps and differences of level when cutting on a large scale begins. The most risky system of felling is that of gradually cutting out the best, or the worst trees, as the case may be, until nothing but a sprinkling of trees is left. This system is a frequent cause of disaster in Coniferous woods, where the trees are more or less top-heavy. So long as the crowns are in touch, or fairly close to their neighbours, the swaying to which we have alluded is reduced to a minimum, while the wind cannot exert its full force upon an unbroken canopy. But when gaps in the latter are made by felling, the wind soon begins to enlarge them, and the effects of this inroad may be felt not only upon the spot, but at more or less distant and younger parts of the wood.

The best method in a large wood is that of clearing a convenient area at regular intervals, beginning in that part where least danger from storms is to be feared. In most districts, this would be the north-east corner, as our most severe gales usually come from the south-west. Conformity and slope of the ground, however, must be considered in deciding this point, as a valley would be less likely to suffer from storms crossing it at right angles, as from those sweeping up or down its length. The shape of the clearing may be either a square or oblong, or may take the form of a strip or band. If each periodic clearing be replanted, and the work steadily proceeded with until the whole of the old wood has been removed, the young crop should present a series of steps, the lowest being on the windward side, and the highest and oldest on the leeward. By such an arrangement, the wind coming from the usual quarter would meet with no sudden check, but be gradually raised from the level of the ground to the top of the highest section at the opposite side of the

wood, supposing the latter is standing on level ground. The number and size of the compartments or sections will, of course, be regulated by the area of the wood, the degree of maturity of the timber, and the desirability of clearing the old crop off rapidly or otherwise; the undulating ground, all knolls, and eminences should be cleared in such a manner as shall prevent the succeeding crop from being suddenly exposed after the trees have attained any great age and size.

Of course, work of this kind entails a little system and forethought, two things which most estate proprietors appear to consider unnecessary elements in wood management, and opposed to all sentiment. But if our woods are to be rendered secure from the severe gales which sweep over these isles more or less frequently every winter, some such system as the above must be adopted, and it will perhaps be found preferable to have regular and moderate clearings, carried out by human agency, than to allow Nature to clear our woodlands for us in her own way. *A. C. Forbes, Bowood, Calne.*

A NURSERY IN THE MAKING.

One would be almost justified in saying that Mr. Mount's nursery at Folkestone is made, but it is quite evident that Mr. Mount himself is not of that opinion, and that the place is still in the throes of evolution, and its growth is so far from completed, that more acres are likely to be annexed "just to allow the Tea Roses to get the benefit of virgin soil, you know." The nursery is situated within two or three minutes' walk of the Central Station at Folkestone, in a bleak wind-swept situation, on the greensand plateau that extends from the range of chalk hills to the sea-coast a mile or so away. It is not two years' old yet, most of the houses, indeed, are not more than six months' old. They have been built by the proprietor himself, they are light, airy structures of the modern type, excellently adapted to their purpose, ventilated in a very simple and efficient manner, on Kinnell's system, and heated by a terminal saddle-boiler, and an adequate supply of piping.

What has been done in six or seven months only affords a lesson to distressed agriculturists. We are far from supposing that the conditions and possibilities are the same for the farmer as for the gardener, still the underlying principle is the same, and it is impossible not to be struck with the value and the number of the crops the gardener gets out of the land in a small time, as compared with the poor results obtained by the farmer.

These six-months-old houses, ultimately destined for pot Roses, have already brought to perfection a bumper crop of Tomatos. Now they are filled with Chrysanthemums for cutting, and when these are over, they will be filled with Cucumbers. The Chrysanthemums are not grown for exhibition, they are not disbudded or mutilated in any way, for Folkestone people have the good taste to prefer a plant *au naturel* to one disfigured by the art of the gardener. And the fine billowy masses of such varieties as "Source d'Or," and of one or two good white varieties show what good judges the Folkestone people are. The Folkestone air goes for a great deal. It is pure, fresh, invigorating to a degree, and damping-off is not to be dreaded. Princess Teck, a variety with white flowers flushed with rose, is largely grown, and Golden Gem shows the effect of the sea air in its vigorous, succulent, deep-green foliage and bronzy flowers—not yellow as they are inland. This succulence and vigour of foliage consequent on the sea air is noticeable in many plants here, as well as the Chrysanthemums, e.g., in the white Arums.

Marguerite Carnations do well; they were planted out and lifted in October, and placed in 32-pots. The plants are not remarkable, but the blooms are very serviceable, and even the single ones find favour—another illustration of the good taste of the Folkestone people. Small Palms for decoration, Heaths, Chinese Primulas, Cyclamens, Swainsona, Pteris tremula, are grown in profusion, and these plants afford a fair indication of the style of gardening done at Folkestone. Private gardens, indeed, are rare and tiny, but window decorations, balconies, small conservatories, and such-like, are abundant, and table decorations consume large supplies of appropriate plants. Various Retinosporas, ericoides, squarrosa, &c., are grown under glass in pots for table decoration, and a very beautiful effect they produce; but it is curious to observe how growth under these conditions alters the appearance of the plants, so that varieties with which one is, or supposes oneself, to be perfectly familiar out-of-doors, when drawn up under glass, are hardly recognisable.

Every preparation is being made out-of-doors for the growth of Tea Roses, and there can be little doubt that a full measure of success will be obtained, for, in spite of a bleak situation, and occasional violent winds, the winter cold is not so severe as it is inland, and the colour and substance of flowers by the sea are notorious.

Doubtless, it will not be long before Mr. Mount will set to work to supply the shrubs and trees suitable for the seaside, such as Austrian Pines, Cupressus macrocarpa, broad-leaved Privet, Escallonia macrantha, Tamarix, Atriplex Halimus, Lycium barbarum, Evergreen Oaks, Common Bays, Gorse (double and single), New Zealand Veronicas, &c.

A selection of the best herbaceous plants is also to be grown, and even up to this time Stocks, Lady Albemarle Godetia, Tagetes, Mignonette, and others are in bloom, and would continue so well into the winter were it not for the fierce gales which destroy them more effectually than the frost. People who know Folkestone in its spring aspect must admire the brilliant golden shoots of the Japan Euonymus at that season. Just now the shoots, which will be a blaze of golden colour in the spring, are of a delicate shade of green, contrasting remarkably with the older deep-green foliage.

Mr. Mount, like a true man of Kent, has hoisted the "white horse" of Kent as his emblem, and taken the proud Kentish "Invicta" as his motto, and when one sees what his quiet energy has affected in Canterbury, one cannot doubt that a prosperous career is in store for him also in Folkestone, now separated from head-quarters by a railway journey of half or three-quarters of an hour only.

JAPANESE PLUMS.*

Of these fine Plums, I wish to state that my experience is limited, but so far as tested on my ground, the fruits far exceed my expectations, and I believe this is true in all parts of the United States where they have been tried. No fruit of recent introduction is meeting the expectations of fruit-growers throughout the entire country equal to these Oriental Plums; their good quality, size of the fruit, smallness of pit, earliness in bearing, great productiveness, handsome colour, freedom from insect pest, long-keeping, and shipping qualities, they are just the Plums to recommend as fit companions for our finest native varieties, and I predict that our cross-bred seedlings of these Orientals, and our Plums, will in the near future make Iowa one of the best Plum States east of the Rocky Mountain region, but this will not be done without hard labour and expensive biological work. In order to create new varieties, cross-fertilisation must be brought to bear. We are standing face to face with a new and more scientific pomology than the most profound student can fully realise, we have taken but few steps in the direction of permanent success in the higher development of Plum culture in our State. We must become students of the conditions that surround us, and use our native fruit as a basal structure to build on, and gain by practical demonstrations a knowledge how to combine the good qualities of native plants with those of foreign origin that possess those qualities which our fruits lack.

These Japanese Plums on my ground have been, so far, a surprise to me, especially their power to endure a low temperature, having withstood 26° below zero without injury, remaining sound to the terminal buds; and the past season the Burbank and Ogon bore a heavy crop for such young trees, and these same trees that bore so heavily this year are extremely full of fruit-buds for the coming crop next year. This indicates great productiveness, and that these Plums bid fair to be heavy annual bearers. Just why these fruits from a mild and genial climate should have such power of endurance in our cold continental climate, one thousand miles removed from the modifying and ameliorating influence of the sea, has been a puzzle to me. By watching them side by side with our hardy natives for the past four years, I have been forced to the conclusion that there was a close relationship between our natives and these Japanese introductions, and that in the pre-glacial climate they had a common origin in North America, in the region of Greenland and Alaska, when that section of the globe was blessed with a climate more temperate even than ours; or it may be possible in the great prehistoric past, geological convulsions destroyed their former continental home in the Pacific Ocean, that at that time may have been connected with North America in the north-west.

Their habits and growth are so much more in harmony with our native Plums than those from Europe, that I am quite sure at one time the continents of America and Japan were connected, and either the climate of Japan then more resembled our present climate, or these Plums and our natives had a common origin. Such hardy Chicasas as Golden Beauty, Honey Drops, Chas. Downing, Col. Wilder, and Wild Goose, also of the minor group, like Hanner, Rockfort, are the varieties that connect our native Plums to these Oriental sorts, like Satsuma, Burbank, Yellow Japan, Ogon, &c. These points of similarity are the early shedding of the leaves, and maturing of the wood, like our Plums named above; also the colour and roughness of the bark, and the fibrous conditions of the inside skin of fruit; and doubtless there are many more points of resemblance that will reveal themselves as we closely study and compare them with our native kinds. However, we must not expect too close a resemblance, for they have been separated for thousands of years, and the conditions that have surrounded them were so radically different it has almost blotted out their connection. When we realise that these Orientals became separated from our natives, and existed in a more genial climate, and show the influence of a high civilisation for unknown ages, while our natives had to struggle against a relentless warfare of elements in climate, savage beasts, wild and destructive races and tribes of mankind, left entirely to Nature's law the "survival of the fittest" in the great struggle for existence, the only wonder it seems to me is, that under such different conditions and treatment for ages, we can find a trace of their origin and relationship. I have expressed my views to some of our pomologists, and will give brief extracts from a few of the letters bearing on the subject. P. J. Berckmans of Augusta, Ga., says:—"Your ideas of a connecting link of the flora of Japan with that of the North American continent coincides with what my dear old friend the late Professor Asa Gray once told me, that he found a wonderful similarity between some of the plants of the United States with their congeners from Japan, which made the study of the latter so very interesting to him. You modestly term yours a wild idea; permit me to say that it is far from such, and really in your letter you but substantiate facts." Professor Bailey of Cornell University, New York, says:—"I am much interested in your letter upon the Japanese Plums. The fruits of Japan and the United States are really closely related; the two countries were once connected at the north-west, and the flora of both originated far north, and driven far southward by changes in external conditions." Prof. G. Goodale,

* By Dr. A. B. Dennis, Cedar Rapids, Iowa. Read before the South Eastern Horticultural Society, December 5, 1893, at Ames, Iowa.

of Harvard University, Cambridge, Mass, says:—"You will find in the article Sequoia, in Dr. Asa Gray's Darwinia, an account of his views in regard to the relation existing between the vegetation of Japan and parts of the United States; it is very interesting to know, that you have independently by your study of Plums arrived at the same conclusion as to many points." W. A. Taylor, Assistant Pomologist, United States Department of Agriculture, says:—"In regard to the Japan fruits about which you write, I am glad to receive your report concerning them, your conclusion that they must have been natives in a more severe climate than that of Japan, is no doubt a correct one." Prof. C. S. Sargent, who has devoted much time to the investigation of Japan trees, and who spent the summer in Japan this year, states, that he finds no wild representatives of the species to which the cultivated Japanese Plums belong." J. L. Normand, of Marksville, La., writes:—"I find that the Japanese Plum has a wide geographical adaptation in the United States, most of them will succeed from the great lakes to the Gulf Coast; and as to their relation with our native sorts, the more I study them the more I find that they spring from the same race of Plums. The flora of Japan and the United States has a close resemblance in many of our wild plants." Prof. C. C. Georgeson says that "the common Wild-fox Grapes of this country (Vitis labrusca) grow wild in Japan." These plants are silent witnesses which unmistakeably prove that this continent was once connected by land with Asia. The American Indian, with his high cheek bones and Mongolian features, is strong evidence that they are of Asiatic origin. Here we have better proof than the ancient legend of the "lost Atlantis" that North America was once connected by land with Asia. In closing, permit me to say, if my conclusions on the affinity of these fine Japanese and our native Plums are true, it opens up a new era in Plum culture, for here we have introduced a fine fruit that doubtless is related to some of our hardy Chicases, and other natives. In their large size and fine qualities lies the condensed improvement brought about by the scientific combinations of the life forces of these Oriental Plums, so really to the Japanese horticulturist we owe much, for we at once can avail ourselves of the wonderful fruits it has taken perhaps thousands of years for him to develop, while our natives were left for Nature to improve them under the law.

I am willing my ideas should receive all that severe criticism can possibly bestow, for if true, I am not concerned about their reception or rejection; and if there are those that wish to combat them, they are welcome to the fruits of their victory; and if they can present better reasons for the splendid behaviour of these Japanese Plums with us, I am willing to accept and pull down all theoretical platforms erected in this paper. I am certain if further and more extensive experiments and tests are made with these Japan Plums, it will not alone greatly enlarge the boundaries of the science of pomology, but greatly increase our list and acreage of fine commercial Plums.

Fig. 84.—ANEMONE JAPONICA, "WHIRLWIND."

ANEMONE JAPONICA, "WHIRLWIND."

Under this name Messrs. Barbier, successors to Messrs. Transon Frères of Orleans, send us specimens of a peculiar variety of Honorine Jobert Anemone. The flowers are semi-double, and more than that, some of the outermost sepals are more or less leafy in character, so that a collar of green, more or less completely surrounds the semi-double white flowers. The plant is, we are told, as hardy and as free-flowering as the original form. The accompanying illustration (fig. 84), for which we are indebted to MM. Barbier, gives some idea of this novelty, but the flowers sent to us were considerably larger than those here shown.

The Rosary.

SHOULD ROSES BE PROTECTED IN THE WINTER?

This question annually forces itself upon our notice, and almost every season we modify our ideas more or less according to the way the Roses have come through the winter. One of our leading amateurs, whose garden is in the south, and by no means exposed, protects his plants to a greater extent than is done by any one else I have known. Compare this with the plan of one of our most successful northern growers, the Messrs. Cocker & Sons, of Aberdeen, who grow both Teas and H.P.'s without winter covering. We could scarcely have greater contrast than these two instances supply, and if both are successful, it at once occurs to me that the first example entails much unnecessary work and expense.

Roses are hardy; so are many other flowering shrubs; but all of them are more or less subject to influences in the matter of aspect, high or low situations, the presence of large bodies of fresh water, and the wet or dry condition of the soil. It would be folly to lay down any rule in this respect, as each must give a little thought on his own account. A plant well in the open, one which has grown more hardy in constitution than its fellow that was in a slightly-sheltered spot, will withstand several degrees more frost, simply because from the first it has been growing in a hardy manner. In the open, too, the plants are seldom exposed to those keen draughts found between buildings and walls when the wind is in an unfavourable quarter. On high land the whole surroundings are drier, and this, together with the fact of better-matured growth in such positions, has much to do with the apparent inconsistency of the effects of frost upon protected or unprotected Roses. The bulk of my plants are in an open field on a hill, with no protection whatever, yet they invariably pass through the winter better than a friend's at the foot of the hill and surrounded by trees, walls, &c. Early and more complete maturation, drier surroundings and freedom from what I must call damp or wet frosts, seem to me the sole causes of this difference.

In the selection of protective material, too, there is much to be said. Why rotten manure should be used for protecting the plants, at the same time that we consider that damp and wet are prejudicial during extreme cold, is one of the puzzles in Rose culture. Our plants certainly do not need manure whilst dormant, and yet the bulk of Rose growers still follow

the old plan of winter mulching with a substance so retentive of moisture that we use it freely for this same purpose during the summer. Whether laying high or low, I would discard rotten manure as a protective agent. If we use the more strawy portions, or shake short litter among our plants, it either soon gets sodden or else blows away into the most sheltered corners of the garden, and consequently where it is least wanted. Rather than use manure, draw a little of the soil around the base of dwarfs of all classes, this will afford ample protection for the base, while a few short branches or twigs set around and among the growth will afford considerable break to frosty winds, and at the same time not induce precocious growth. It is the latter, and the subsequent check from late spring frosts, which sets me against the plan of protecting our Roses, almost as if they were half hardy, instead of being more or less hybrids from, and worked upon, our native flowers. *A. P.*

NOTICES OF BOOKS.

THE NESTS AND EGGS OF NON-INDIGENOUS BRITISH BIRDS OR SUCH SPECIES THAT DO NOT BREED WITHIN THE BRITISH ARCHIPELAGO. By Charles Dixon. (London: Chapman & Hall.)

A further contribution to the number of popular books on ornithology by this author will be acceptable to many who are interested in this science, and whose text-books perchance give them information about foreign or about native British birds, yet but little or none concerning visiting or migratory species.

The fact is, that the subject has, as yet, but few students, and therefore information with regard to it is still scanty. Many species of birds are comparatively well-known as regards themselves and habits while on English soil, but details of their life abroad during the pairing and breeding season are still wanting, as also is certain knowledge of their eggs.

Therefore, we repeat, this book, devoted to the consideration of non-indigenous British birds, should prove welcome. It is carefully arranged, has a full index, good clear print, and one coloured plate, representing certain somewhat rare or otherwise remarkable bird's-eggs. The information given is gleaned concerning a yet little-explored ground, to the study of which it may attract that further study from experts which is necessary to ensure a more perfect knowledge of it.

FLORE COLORIÉE DE POCHE A L'USAGE DU TOURISTE DANS LES MONTAGNES DE LA SUISSE, DE LA SAVOIE, DU DAUPHINÉ, DES PYRÉNÉES, DU JURA, DES VOSGES, ETC. Par H. Correvon, Directeur du Jardin Alpin d'Acclimatation, à Genève. Dessins par A. Jobin. (Paris: Klinsieck, 52, Rue d'Ecoles. London: Williams & Norgate.)

This, the second volume of the naturalist's pocket library, is, as it should be, considering the purpose for which it is intended, of handy size and plainly printed on good paper. The little volume contains 144 coloured pictures, representative of such species of plants as the traveller is most likely to meet with, and these, if not delineated with the technical detail a professional botanist might require, are at least sufficiently faithful to enable the ordinary observer to name most of the flowers he finds. The little pictures are, in fact, pretty, but not flattered likenesses of alpine and other Swiss favourites, and as such add greatly to the usefulness of the book. In some cases, e.g., Cypripedium calceolus, the colouring is not quite what we should expect to see in Nature. Some scale of proportion should also have been added to the figures, for nothing is more misleading to the casual botanist than figures without a scale. The popular names in French, German, and English are given, and the technical descriptions are clearly and accurately drawn up.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

EXCESSIVE MOISTURE OUT-OF-DOORS. — The weather up to Tuesday, November 27, was mild for the season of the year, but owing to the late heavy rains, the external air is so moisture-laden as to call for an extra amount of artificial heat in most of the houses to prevent evil effects; considerable attention is required to avoid any excess of heat from this source, which would act just as prejudicially, by causing too great drying of the internal air. In the Odontoglossum-house most of the occupants are in active growth, and the young leaves, therefore, are very tender, and liable to spotting at the points, and large damp patches make their appearance on the old foliage, caused, no doubt, by the atmosphere being too much charged with moisture. When these appearances are remarked, it will be advisable to discontinue damping down for a few days, and keep the hot-water pipes lukewarm, not with the object of raising the temperature, but merely to admit of the freer use of the ventilators, every opportunity being taken on fine days to liberally afford air from without.

PLEIONES. — Notwithstanding the lack of light and sun-heat at the time when the pseudobulbs of these plants needed maturing, a greater number of flowers are being produced than in some previous years more favourable to growth and ripening of growth. The blooms are larger, and the colours more brilliant. Such popular varieties as P. concolor, P. maculata, P. lagenaria, P. præcox and its variety, P. Wallichiana will, in most collections, be going out of bloom, and require immediate re-potting, an operation which should be carried out before new roots push from the base of the new growths, for if delayed till these advance somewhat, many are certain to be injured. Whether ordinary flower-pots or those shallow pans that are in general use, be preferred, sufficient drainage-material must be afforded to permit the passage of the large quantities of water that these plants require when in full growth. Over the crocks it is necessary to place a thin layer of sphagnum-moss, so that the compost may be kept moist and the drainage unclogged by soil. Remove the pseudobulbs from the pots, and shake the plants out of the soil, cutting off any dead roots. It is not necessary to part every pseudobulb, but simply to repot them in clumps, the pseudobulbs almost touching each other. The compost may consist of equal parts of fibry-loam, peat, and sphagnum-moss, with a sprinkling of coasse silver sand, the whole being intimately mixed together before use. Where it is possible, the spaces between the bulbs should be filled in with the roughest parts of the compost, giving preference to the sphagnum-moss. After repotting, the plants should be placed near the roof of the Cattleya or intermediate-house, and be afforded little or no water before the young growths start away vigorously, or they may turn black and then decay. As soon as the roots are fairly active, water may be sparingly applied, and as the leaves develop, more frequent and liberal waterings will become necessary. When well established, supplement the usual waterings with weak liquid manure-water afforded about once a week.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

BLACK CURRANTS, PRUNING, ETC.—To make the fruit garden appear as neat as possible, it will be well to finish the pruning of the bush trees, &c. The pruning of Black Currants will consist in a thorough thinning out of the wood in bushes which have become dense in growth, and in shortening back the young shoots to eight or nine buds. Bushes so treated are erect under a full crop of fruit, but if the growths are left full length, and the most straggling branches only thinned out, the result is the very opposite. Black Currants make handsomer and more easily-managed bushes if grown on a single stem for 6 inches above the soil. But in land where the branches are liable to die off, it is advisable to allow suckers to grow, selecting sufficient of these for fruiting branches, being careful when pruning each year to remove all that are not required to replace any dead branches. When the pruning is finished, the bushes should receive a top-dressing of rotted manure, and this may be covered over with surplus soil from another part of the garden; or where such manure is not easily obtained, the bushes should receive extra waterings with liquid from the manure-tank.

RASPBERRIES.—Established plantations of Raspberries may also be pruned at this time, and if there are newly-made plantations, they should be left until the spring. Where trellises are used, the canes should be trained about 9 inches asunder. If the canes are trained to stakes, and these were sufficiently stout in the first place, they should last good for two years — but any that have already been in use for this time, should now be replaced; and if the stakes were prepared last winter, and kept under cover, as I then advised, not only will they last much longer for being thus seasoned, but they are now ready for use. For strong-growing kinds as Prince of Wales and the newer Superlative, the stakes should be 7 feet above ground, four canes being tied to each stake. When the pruning and tying are finished, clear the land of any strawy litter left from the mulching applied in the summer, and pull up any weeds that may have grown. A top-dressing of rich, light soil should be given if the staple be heavy and retentive, and in the case of gravelly or light soil, a top-dressing of rich heavy loam will be beneficial, as will also be waterings from the manure-tank on all favourable opportunities throughout the winter.

PLANTS UNDER GLASS.

By J. F. MCLEOD, *Gardener, Dover House, Roehampton, S.W.*

WINTER-FLOWERING BEGONIAS. — Where a stock of these most useful plants is grown, the quantity of blooms they should be now producing will be a welcome feature in the garden, and although a plant here and there in the various houses is useful in creating a bright appearance, it is only when staged to form a group, and arranged with a carpet of small Ferns, and relieved by a few handsome Palms of about 18 inches high, that they look best, and they make a most interesting show in a small house by themselves. A temperature of 50° by night, with free rise by sun-heat, will be adequate.

GLOXINIAS.—Where bulbs were ripened-off early last season, and a sufficient rest has been given, a batch may now be put into heat for early spring flowers. Do not disturb the bulbs in this batch, but merely give a good watering, after which, when sufficiently dry, a top-dressing may be given of loam, leaf-soil, and a dash of Thomson's Vine and Plant Manure. This done, stand the pots on shelves in a warm house.

HELIOTROPE.—Plants for supplying cut flowers in spring or for furnishing purposes will be benefited by a slight dose of some sound artificial manure, provided there are plenty of roots, and these are in a healthy condition. Pinch the strongest growths, so that the energies of the roots be equally distributed amongst the branches. H. President Garfield is amongst the best for pot-culture, being of a robust dwarfy habit, peculiarly adapted for such purposes. Stand the plants on shelves or benches near the glass in houses where abundance of air is admitted, and keep the pipes slightly warm.

IVY-LEAVED PELARGONIUMS.—With a similar treatment as regards temperature and feeding, these will thrive well, pinching having been done at an earlier stage, should not be practised now. Place neat sticks to each plant, and secure the leading stem, slinging the remaining growths to the centre by a well-twisted thread of raffia. P. Souvenir de Charles Turner is one of the most reliable for early spring blooming.

LILIUM HARRISIANUM.—The first batch should now receive a little feeding, and this may consist of farmyard drainings, or of some chemical, but whichever is used it should be applied in a weak solution. Fumigate mildly on two consecutive nights if green-fly appear, and red-spider may be checked by syringing with soot-water. Stand the plants as near the roof-glass as is safe, in view of frosts, to promote a robust habit. Late batches may be kept somewhat cool.

CHRYSANTHEMUMS.—Preparations should now be made for putting in the cuttings of the later sorts, small pots and crocks should be washed, and the soil mixed together. It is well to prepare soil in sufficient quantity for the varieties to be propagated

during this and the following month. A beginning may be made with such varieties as W. G. Drover, Boule d'Or, the older Meg Merrilies, Madame C. Audiguier and others. Select cuttings of medium strength, avoiding those that are overgrown, and full of sap; preferably, select those which are slightly matured, as these make the best plants in the end. Cut square below a leaf, and make the cuttings about 3 inches in length. These should be placed round the sides of 3 inch pots, where they will root sooner than if put singly in small thumbs. Water should be given as soon as the cuttings are inserted. Put the pots in some cool place, where frost can be excluded, and stand them near the roof-glass; frequently damp the leaves, and shade from strong sunshine. It is not necessary at this early period that sheets of glass should be placed over them.

GENERAL WORK.—As the various houses undergo the annual cleaning, and the plants are passed through the hands from one place to another, it will be well to take any that are showing signs of weakness, or that have an untidy appearance, and place them in a suitable structure until an opportunity offers itself, when a thorough diagnosis can be made, and they can be either cut up for stock, put on the fire, or taken in hand with a view to restore them to health and vigour. This latter practice I believe is often a waste of labour, as in many instances young stock can be more quickly raised, and it will be less liable to give trouble in subsequent stages. Only the best of the plants then out of condition need be preserved for hospital treatment, and there will remain those that are to be cut up for young stock. In gardens where propagating quarters are limited, and the bottom-heat inadequate, it will be well to defer propagation for some time, but should these essentials be at command, I should not hesitate to put in cuttings of ordinary stove and greenhouse plants at once. Plunge the pots in tan or cocoa-nut fibre refuse, and give less water to the foliage. Aim at a steady temperature, and open the frame twice daily, when the moisture should be wiped from the glass.

THE KITCHEN GARDEN.

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

RHUBARB AND SEAKALE.—These roots may be forced in a Mushroom-house or other warm darkened place where a temperature of not more than 60° is kept up day and night, and a suitable degree of humidity is afforded. A higher temperature than this results in flavourless, drawn produce. Not a ray of light should reach the Seakale, but this is of no importance with regard to Rhubarb. When the roots of either are put into a forcing place, the light soil in which they are necessarily embedded should receive a good watering at the finish, to be repeated when it is found that the soil is getting dry.

NEW ASPARAGUS BEDS.—For this purpose it is advisable to prepare the ground at this season before hard weather begins, as it will then settle during the winter, and be in good order for planting. All land for this crop, whether intended for permanency, or merely for cultivating the plants for forcing purposes, should be trenched. In the case of shallow soils or infertile subsoils, the trenching need not be more than two spits deep, the bottom soil being well broken up, but not brought to the surface, but plenty of partly rotten manure, garden refuse, tree leaves, and such like should be incorporated with it. Manure in a rotten condition should be placed within one spit of the surface, in a layer of regular thickness. Heavy soils are also improved by receiving in the spring a good dressing of rotten manure, sand, and wood-ashes, or the ashes produced by the charring of garden rubbish unsuited for applying to soils unless charred. Always let the surface remain in a rough state as dug, the mellowing influence of frost and wind during the winter rendering it the better fitted for planting. If the garden is low-lying, place in the bottom of the trenches as much coarse manure and other porous materials as will have the effect of raising the surface of the soil considerably; the lower roots being then in a warmer and less moist medium, will be retained, whereas, otherwise, these would be sure to decay. When the soil and climate conduce to free growth, I would always prefer to plant in rows 3 feet apart, disposing the plants therein at 2 feet, and taking a crop from between the rows of Cauliflowers, Early London by preference, because of its smaller growth and quicker returns, as compared with Autumn Giant. This intercropping should take place the first year only. Under circumstances less favourable to the growth of this plant, it is better to plant in beds consisting of three or four rows each.

SEAKALE.—Advantage should be taken of a spell of dry weather to lift the entire crop that is intended for forcing in beds, taking care in doing so to remove every bit of root, as it will grow if left in the soil, and become a source of trouble. The best method of digging up the roots is to open a trench two spades deep on one side of the plot, and gradually fork out and undermine the roots, trench by trench, raising them with as little loss of root as possible. The long thong-like and useless roots may be cut off and placed in a basket, which will be found a more expeditious method than leaving them on the ground to be afterwards collected. The roots should be at once trimmed, all those pieces that are sufficiently strong for making sets being put aside, to be afterwards placed in a shallow bed of mould and covered with litter, to keep them from shrivelling, till they can be made into proper sets. The forcing roots should be laid-in closely in some convenient spot till required, leaving the crowns and an inch or two of the root above the soil. A little litter, tree leaves, or sifted coal-ashes may be laid over them in hard weather. The old variety does not take any harm from frost, but the lily-white variety, now so much prized, is less hardy, and should be protected.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

TOMATOS.—Plants with green and ripening fruits should have a free circulation of air given them night and day, unless during very frosty weather, sufficient fire-heat being maintained to keep the temperature at 55° by night, 60° to 70° by day, according as the weather is mild or cold. It should be borne in mind that at this season especially it is useless to coddle them in a close warm temperature with the idea of getting more blooms to set, and if fruits do set at this season it will be under the conditions of good ventilation. As a rule, Tomatos do not fruit satisfactorily if a good set be not obtained before the end of the month of October, and even during that month the flower-trusses being weak and the flowers deficient in pollen, every care is needed in impregnating them; and even with this attention the fruits are usually corrugated or deformed. Tomatos in pots should be watered not very copiously, keeping them on the side of dryness. The lateral shoots and lower leaves may be removed, but a little growth may be allowed at the top of the stem, so that the roots may maintain their activity. Those Tomatos which are planted out in beds will require a similar kind of treatment, letting the leading shoots grow whilst the fruits are swelling. The latter will hang on the plants for a long time after they are ripe at this season if the air is kept dry and the ventilation well attended to. As soon as the fruits are cut, throw away the old plants, young plants raised from seeds sown in a gentle hotbed about December 21 being more profitable. Young seedlings grow on quickly when the amount of daylight increases, and if they are kept near the glass and re-potted on when they require it. For early fruits there are no varieties better for cultivating in pots or planting out than Prelude, Ruby, Trophy, and Green Gage. The great demand in most families for Tomatos makes one quick to discover places where they may be grown to advantage. The plants often give useful late crops if planted out at the end of June or in July in late Peach or orchard-houses against the walls, pillars, or trellisses, keeping them to one stem, laterals and gross leaves being cut off, but allowing the leading shoot to grow as far as it will. The fruits keep well into the winter if frost be kept out of the house, and although the fruit may not be of so good a colour as those from a warm airy house, it is still very useful.

CUCUMBERS.—Much care will now be required to keep up a succession of shapely fruits, not bitter at the bottom. The heat must be kept steady at about 80°, the night temperature 70°, by day 80°, or higher with sun-heat, and air afforded, taking care not to admit cold winds or frosty air. When possible, close the house with sun-heat, damping the floors and walls. It is always advisable to cover the glass with mats or canvas, so as to keep the temperature steady, and the air moist. Water should be carefully afforded about once a week at this time of the year for those planted out in beds, and it should be of the same temperature as that of the bed; those growing in pots will perhaps require water at the root oftener than those planted out. Liberal top-dressing of manure will be required from time to time, and the fruits to be thinned—a very light crop of these being best; also the foliage or shoots must not get crowded. Top the points of the shoots, but not all at the same time. Towards the end of the month make a sowing of seeds for succession.

HOUSES OF MIXED POT-FRUITS, such as Peaches, Nectarines, Cherries, Plums, Pears, &c., that are required to fruit early in the spring, should now be put in order and started, cleaning, training, top-dressing where needed being finished. Afford a thorough watering to plants in pots, and cover them with litter or leaves, but not so that much heat is engendered. The fire-heat should be just sufficient to keep the temperature at about 45° for a fortnight, air being afforded on sunny days; the temperature rising from 10° or 15° by day, and damping the trees daily with tepid water.

STRAWBERRIES.—A hot-bed of leaves should now be prepared for starting the first batch, and if the pots are set upon the leaves for a time, keeping them as near the glass as possible, and the temperature of the pit at about 50° till they have made a start, they will succeed much better than if placed at once on the vinery shelves. When the bloom-trusses show, the plants may be removed to airy shelves, and the day temperature increased 10°. Previously to starting, turn the plants out of the pots and see if the drainage is in good order, removing decayed leaves, and affording them a watering of clear lime-water to destroy worms.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

ASTERS.—Where collections of these Michaelmas Daisies are grown true to name, and a careful selection has been made, a long season of flowering is obtained, and although the flowers are not very showy, they are extremely useful when frost has made outdoor flowers scarce. They are well adapted for decorative purposes, are easily grown, almost any kind of soil suiting them, and frost and snow have little or no effect upon them. Several varieties are suitable for planting among rock-work, such as Aster alpinus in several varieties, flowering in early summer, and growing only about 6 or 9 inches high. Alpinus speciosus, one of recent introduction, has large flowers of a dark violet colour, and flowers for a long season in early summer. It grows in a dense mass, with flower-stems of about 6 inches long. A. hybridus nanus, 1 foot high, flowering in October, rosy-lilac. Aster Amellus and its varieties bessarabicus and major, are dwarf, blue varieties of about 2 feet high, flowering in September. Robert Parker, although tall, being 5 feet high, is a pleasing blue, and is one of the very best for decorative purposes; A. novæ belgiæ, deep red, and A. novæ angliæ, rose-pink, flowering in October; A. dracunculoides, purple, 2½ feet, high; A. lævigatus, deep blue, 5 feet; A. Milleri, blush-white, about 3 feet high; A. dumosus, 1½ feet, white; and A. elegans, 3 feet high, white, all flower in September; A. ericoides, 2 feet, white; and A. Reevesii, 1½ feet, flower at end of August; A. versicolor, white and purple, 4 feet high; and A. v. minimus, white and lilac, 3 feet high; A. undulatus Drummondii, lavender; A. turbinellus, pale blue; A. thyrsiflorus; A. cordifolius, pale blush, dwarf; A. Archer Hind, pale blue; A. E. G. Lowe, pale lavender; A. Apollo, lavender-blue; and A. Purity, a fine white, are among the most useful of the many varieties of these now obtainable.

GENERAL WORK.—The beds having been cleared of the summer plants, the flower garden will present a naked appearance unless use has been made of some of the many beautifully-berried and foliage shrubs as advised in a former calendar. Every attention should be given to ensure thorough neatness in the flower garden; more especially will attention be needed where large deciduous trees abound. Lawns and walks should be frequently rolled, the former owing to the rains will be greatly benefited thereby. The walks also by being frequently rolled, become solid, and almost impervious to rain and frost, and less liable to become infested with weeds. Drains should be examined in case of heavy rains. Now that the leaves are all fallen, these should be raked out clean from underneath shrubs, or on the first rough wind they will be continually shifting from one part of the grounds to another. Save all the best Oak and Beech leaves to make leaf-soil for potting purposes,

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	DEC. 3	Special Sale of Hardy Perennials, Carnations, Picotees, Iris, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, Azaleas, Dracænas, &c., at Protheroe & Morris' Rooms. Clearance Sale of the Stock in Trade and Glass Erections, at the Nursery, Bolton Lodge, Wood Lane, Bradford, by order of Mr. Fred. Parker, by Protheroe & Morris (two days).
TUESDAY,	DEC. 4	Dutch Bulbs, at Protheroe & Morris' Rooms. Imported Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 5	Dutch Bulbs, at Protheroe & Morris' Rooms. Consignments of Japanese Lilies, and 200 000 Palm Seeds, Roses, Gladioli, &c., at Protheroe & Morris' Rooms. Nursery Stock, at Frettingham's Nurseries, Stapleford, by Protheroe & Morris (three days).
THURSDAY,	DEC. 6	Dutch Bulbs at Protheroe & Morris' Rooms. Clearance Sale of Fruit Trees and other Stock at the Osborne Nursery, Sunbury, by order of Mr. John Turtle, by Protheroe & Morris.
FRIDAY,	DEC. 7	Orchids at Protheroe & Morris' Rooms. Sale of Havana Cigars at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.2.

Change in the nature of Buds.

Is it possible by art to effect the transformation of a leaf-bud already formed into a flower-bud or *vice versâ?* The change occurs frequently in nature, but we doubt whether gardeners can make the change of set purpose. Still, it would seem to be quite within the range of possibility. To bring about the production of flower-buds where, without interference, leaf buds only would have been formed and *vice versâ*, is much more practicable. This is often confounded with the transformation of one sort of bud into another, but a little reflection will show that the two cases are very different. Our attention has been drawn to the matter by an article in the *Revue Horticole*, by M. DELAVILLE. This well-known practitioner, with a view to obviate the formation of Peach shoots with flower-buds only, cuts away the free end of such shoots immediately after the fruits have been gathered. A blind shoot which bears flower-buds exclusively with the exception of the terminal bud is called by the French gardeners a "chiffon." Such a shoot is, of course, objectionable, because when the flowers and fruits fall, nothing is left but long bare shoots which can extend only at the tips by means of the terminal bud, and which frequently shrivel and die. Such shoots, we may add, are not very common in this country, though no doubt they do occur but more generally in consequence of the fall of the leaf-buds. To remedy this, M. DELAVILLE, as we have said, prunes the shoot so as to leave only about half of it, and the result is the formation of leaf-buds on the remaining portion of the shoot mixed with flower-buds. The process is rendered more certain by the performance as soon as the fruit is gathered of the following operation. The blade of a budding-knife is passed obliquely through the bark and the sapwood as far as the pith. This incision is about a quarter of an inch in length, and is made just about the position of the second leaf from the bottom. The wound speedily heals, and induces the buds at the base of the shoot to develop as leaf buds capable of forming extension shoots in the spot where otherwise a fruit bud, and that, perhaps, an imperfect one, would have been formed.

The operation is important, as it secures that the tree shall be well furnished with branches, and that it shall not become bare by the death of incompletely formed shoots.

The diseases of Trees.

THOSE interested in the growth of trees, whether as park specimens or for timber-producing properties, will assuredly be interested in this valuable treatise.* In its German text it was known to a few, in its French dress to a few more, but it was high time it was made accessible to the English reader. In no other work that we are acquainted with, is the subject, within the limitations fixed by the author, treated so lucidly; in no other work are the details of the changes wrought by parasitic fungi in the fabric of the tree so carefully worked out. Previously to the publication of this work, there was little or nothing available for the use of the English student but the papers on vegetable pathology compiled by the late Rev. M. J. BERKELEY, and published in instalments in these columns. As these papers ran through several volumes, and were never separately reprinted, it is not now easy or convenient to study them, but for those who desire to do so, it may be convenient to mention that a full analytical index is given at p. 677 of our volume for 1857. Since BERKELEY took up the subject, however, the life-history of many of the fungi concerned has been more thoroughly investigated, and improved methods of research and observation have been devised. BERKELEY's work, however, for the time at which it appeared was excellent, and more modern research has, in many instances only confirmed his opinion.

In the present volume, diseases are considered according to the causes that produce them, such as parasites of all kinds, wounds, faulty state of soil, or unfavourable atmospheric condition. This is of course a scientific mode of procedure, and in the long run the best in practice, for, unless the causes of the disease are known there can be no such thing as cure. Still, the forester and the gardener require, in the first instance, to recognise the nature and symptoms, or rather the signs of the disease (for symptoms are subjective, and as such, not forthcoming in the case of plants), and these signs, though by no means passed over in this volume, are yet hardly set forth with sufficient prominence for practical use. Take, for instance, the "canker" of the Apple or the Beech. There is in this volume a clear summary of what is known concerning the diseased conditions, but it is placed either under the head of Nectria ditissima, or of injuries due to atmospheric influences, but how few gardeners have ever heard of or seen the fungus! Similarly, the appearances of Larch-canker are described under the head of Peziza Wilkommii—appropriately enough, no doubt, for the initiated, but not so conveniently for those who perforce have to pass from the known to the unknown, and by whom the meaning of "mycelium," "hymenium," "gonidia," "spores," and even of "cortex" is only imperfectly if realised at all. The Editor of the present work has recognised this, for while not altering the plan of the volume, he has added in many cases explanatory notes; and these, together with the brief summary of diseases, classified according to the plant, and part of the plant attacked, and an excellent index, do much to diminish the inconvenience we have alluded to. If in a subsequent edition the diseased conditions, as seen by the naked eye of an ordinarily good observer, could be described under a few general headings, such as "canker," "ulcer," "tumours," &c., before launching into details appreciable only by the trained student, the value of the book would be much enhanced.

The summary just mentioned is all too brief, and in subsequent editions this also should be largely extended. For instance, a few years ago, apparently from some climatal cause, the Lombardy Poplars in this country, and, we believe, on the Continent, suffered great injury, and their upper branches died, as in the case of stag-headed trees. We turn to the classified list of the volume before us, and under Populus pyramidalis (which, by the way, is hardly the correct designation of the Lombardy Poplar), the only statement we find is, "The branch and twigs die." A reference to a fungus Didymosphæria populina, described at p. 104, is given, but that description does not apply to the particular disease of the Poplar to which we refer. Removal of the heads of the trees in an avenue known to us checked the disease, and its traces are now no longer visible. So under Ulmus all the information about diseases of the Elm vouchsafed to us is this, "The leaves show vesicular blotches: Exoascus Ulmi." On turning to p. 135, as directed, we find, "Exoascus Ulmi produces outgrowths on the upper side of Elm leaves." One need not be a forester to know that this statement is meagre in the extreme, and that it does not exhaust the list of diseases to which Elms are subject. Under Cratægus, or Hawthorn, we find no mention of a very peculiar hypertrophy and hardening of the stem, apparently unconnected with fungous attack.

Whilst thus indicating a few of the weak places which frequent use of the original work has brought under our notice, we do so without the slightest intention to under-value what is, so far as it goes, the best work on the subject in existence.

The translation has been well done, and the preface, by Professor WARD, is what a preface should be, an introduction to what is to follow. Professor WARD, however, uses the term "pathology" in a sense which is not usual, but in this he is not alone, viz., as the equivalent of abnormal physiology, or as the "study of disease," rather than as the result of abnormal or morbid physiological action. The illustrations are excellent, and the work, as a whole, well got up. It will, we hope, do something towards the establishment here of a central institute, with local branches, for the study of vegetable pathology. In France and in Germany they abound, in the United States they may be counted by the score, but in this practical country we have no such separate department, though the excellent services rendered incidentally by the department at Kew cannot be over estimated.

* *Text Book of the Diseases of Trees.* By Professor R. Hartig (Translated by Dr Somerville, revised and edited by Professor Marshall Ward). London: Macmillan & Co., 1894.

Kew Bulletin.—The October number contains articles on Lathyrus fodder, descriptions of new plants, inclusive of new Orchids, bulbous Violets, and various other subjects. That pulse should be poisonous is a disquieting suggestion, nevertheless it appears that the seeds of Lathyrus silvestris do contain a poisonous alkaloid, which if partaken for a sufficient time produces most serious effects. Happily the alkaloid is volatile, and is dispersed by heat, so that by thorough cooking the evils may be averted. Horses who eat the seeds in their natural condition are grievously affected.

Linnean Society.—An evening meeting will take place on Thursday, December 6, 1894, at 8 P.M., when papers will be read on:—1, "A New Revision of Dipterocarpeæ," with lantern-slides, by Sir D. Brandis, F.R.S., &c.; 2. "On the Spinning Glands in Phrynus," by H. M. Bernard, F.L.S., &c.

National Chrysanthemum Society.—A meeting of the general committee was held on the 19th inst. at Anderton's Hotel, Mr. R. Ballantine in the chair. The secretary reported the awards of Medals made to miscellaneous exhibits at the November show by the Arbitration Committee, and the same were unanimously confirmed. The Secretary also reported that the prize-money awarded at the November show would be paid in the coming week. A financial statement was submitted by the secretary showing that the sum of £391 had been received as donations, subscriptions, entrance-fees, sale of tickets, and catalogues, &c. After some discussion, it was resolved that exhibitions should be held at the Royal Aquarium in October, November, and December, viz., on October 8, 9, 10; November, 5, 6, 7; and December 3, 4, 5. In the course of the discussion which followed on the proposal to hold the November show on the above dates, a desire was expressed by the plant-cultivators and exhibitors that November 12, 13, and 14, be fixed upon in preference to the earlier dates, but it was felt that the alteration would injuriously affect many of the London suburban societies, and the earlier dates was fixed upon. It was suggested that more frequent meetings of the Floral Committee might be held during the months of October and November, and it was referred to the Floral Committee to consider the same. Eighteen candidates for membership were elected, and the South Australian Gardeners' Society and the Banbury Chrysanthemum Society were admitted to affiliation.

"Wayside Ireland."—This is a brief record of a holiday trip from Cork through Connemara to Achill Island, and back, undertaken by Mr. W. Baylor Hartland. The reader will be delighted and amused at the originality and humour of the writer, and he will be still better pleased at the shrewd observation and practical suggestions which Mr. Hartland is so capable of making. The excursionists were in high good humour throughout, and their good spirits are infectious, as the reader will find when he comes to read this little pamphlet. The beauties of Kilkee and Lisdoonvarna are duly descanted on. At Ballyvaughan the Riccarton Fuchsia thrives, and Dahlias live out all the winter, and become huge bushes of bloom. Galway forms a great contrast to busy Cork. "The west of Ireland has its truly magnificent scenery, beauty, and attraction, but trade, none"—though the amusing account that immediately follows of the sucking-pig market shows that at least some trade is done. Ireland, says Mr. Hartland, has nothing but agriculture to live on, and it is not half worked, at sea or land, for want of proper teaching; and then he goes on to recommend the establishment of State Agricultural Schools in every province of Ireland. "This, with peasant ownership, would have saved the Crown a lot of trouble, and made poor Paddy better able to meet Free Trade Laws than going out moonlighting, and making silk and ermine for lawyers. Connemara," he continues, "should have been state-planted years since." The state of agriculture in Achill Island is, as might have been expected, not in a very forward state—"Potatos in lazy beds, Oats wretched, Rye worse. Women in the fields reaping with a hook; and where crops were cut, fetching home the contents along the road on their backs to be stacked near the houses." We refer the reader to the proposals made by Mr. Hartland for the improvement of Achill. "In twenty years, *under a paternal care* (the italics are the author's), the whole island would be revolutionised, as from once the farms got into the hands of peasant proprietors, in suitable portions, and that they were technically

Fig. 85.—Eucharis grandiflora. (see p. 666.)

educated, clauses enforced against subdivision, there should be no fear of Achill and its inhabitants." The author concludes thus:—

"And my pen gets at the bottom of a page which being finished. Here the story ends.
'Tis to be wished it had been sooner done,
But stories somehow lengthen like journeys when begun."

We do not wish to be uncomplimentary to Mr. HARTLAND, but we do not agree with his conclusions, for we have not found a dull paragraph throughout his "untutored" pages.

DEAD POULTRY SHOW.—The first Christmas table-poultry exhibition will be held in connection with the Smithfield fat cattle show at the Royal Agricultural Hall, London, on December 11, 12, and 13, next. The object of the show, says Sir WALTER GILBEY in a communication with which he has favoured us, is to encourage, amongst farmers and others, the production of a larger supply of table poultry, of improved quality, and to prevent the increase of poultry importations into this country from abroad. We paid foreign countries during last year £4,450,598 for eggs and poultry alone; within a period of twenty years our imports from abroad have increased by nearly 450 per cent., and still show a constant advance. This large import, together with our home productions, has been insufficient to supply our requirements in the matter of table fowls, particularly of good quality. It is only in the cities and large towns that poultry can be obtained which is of first-class quality for the table. But very few of the large number of those who keep poultry consider it necessary to "prepare" them for the market and table use. It is to be hoped the lessons to be learnt from the specimens on exhibition will lead to a better knowledge as to the most suitable breeds, and the methods of feeding, fatting, dressing, and preparing poultry for the market and table use. One of the conditions of entry is, "the birds must be sent killed and plucked, and the breast-bones unbroken." The prize-list contains thirty-eight classes, for dead fowls, ducks, geese, turkeys, guinea-fowls, pigeons, and rabbits; the prizes in each class are 40*s.*, 20*s.*, 10*s.*, and 5*s.*, and, in addition, ten silver cups, two gold medals, and ten silver medals. The cups and medals are given as special prizes by the Corporation of the City of London, the Poulterers' Company, the Mercers' Company, the Drapers' Company, and the Royal Agricultural Hall Company. The last day for the receipt of entries is Saturday, December 1 next.

A BULBOUS VIOLET.—In the last number of the *Kew Bulletin*, Dr. STAPF calls attention to a curious little bulbous Violet found in the Himalayas, at Bussahir, at an elevation of 10,500 feet, and by Sir JOSEPH HOOKER, in Sikkim, at 12,000 feet. There has been some confusion about the identity of the species, but Dr. STAPF adopts the name proposed by MAXIMOWICZ, namely Viola bulbosa. The bulbs attain the size of a pea, and are made up of 4 to 8 fleshy scales surrounding a central axis. The scales are the thickened bases of modified leaves. Above the bulb the axis is prolonged into a short slender stalk, ½ to 2 inches long, terminated by a rosette of leaves, from the axils of one or two of which proceed the flower-stalks, and the flowers are white streaked with purple.

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—The annual general meeting of the above Society was held in the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on November 24, by kind permission of the members. EDMUND CHARRINGTON, Esq., presided. The President, Vice-Presidents, and the members of the committee were re-elected, with the exception of Mr. LAKIN, who withdraws from the Society, Mr. MARTIN ROWAN being elected in his place. Mr. G. W. WHEELWRIGHT was appointed one of the auditors. The financial statement by the treasurer showed a balance in hand of £20 9*s.* 4*d.* The National Carnation and Picotee Society (Southern Section) held its annual meeting at the same time and place, EDMUND CHARRINGTON, Esq., presiding, in the unavoidable absence of the President. The President, Vice-presidents, and office-bearers, were re-elected, with the exception of D. BOGUE, Esq., Vice-president, J. S. HEDLEY, Esq., being elected in his place. Mr. JOSEPH LAKIN and Mr. H. W. HEADLAND have withdrawn from the Committee; Mr. AUBERY SPURLING and Mr. BEN. SIMONITE were elected in their place. The financial statement by the treasurer was eminently satisfactory. The amount of £107 was paid in prizes, and the balance in favour of the Society is £159 3*s.* 7*d.*

BENTHAMIA FRAGIFERA.—Mr. WEBBER sends from Dunster Castle Gardens fine fruits of the so-called Strawberry tree, which seems to thrive in the south-western counties, but near London we do not ever remember to have seen it. No. 1 came from a south wall, which is much the finer fruit; No. 2 from west. "They flower and fruit," he says, "most years a little, but I have never seen them do so well in the eight years that I have been here before; no doubt it is the effect of the summer 1893. It is a pity the fruit is of no use for dessert, as it looks very tempting when ripe. The birds are eating the fruit."

THE LATE MR. CHITTY.—A sentence in the obituary notice sent us of the late Mr. CHITTY has, we regret to find, given pain to some of the friends and associates of the late Mr. HIBBERD, and who are in a position to know the facts of the case. As it stands, the assertion may be taken to cast some aspersion on Mr. HIBBERD's literary honour. We are sure that no such reflection was intended by the writer, and we are sorry that our inadvertence should have led to the insertion of a remark capable of an interpretation we should ourselves never have entertained.

PYRUS JAPONICA.—Mr. COURTAULD sends us from Essex fine fruits of this species. They are not very uncommon, but seem to vary in colour and form, as might be expected. The fruits of the nearly-allied P. Maulei make excellent marmalade; whether those of P. japonica would do so we do not know, but we suspect the flavour would be too harsh.

THE WOLVERHAMPTON GARDENERS' ASSOCIATION has decided to form an "auxiliary" of the Gardeners' Royal Benevolent Institution. This will be inaugurated on December 4. The MAYOR is to preside, and Messrs. H. J. VEITCH, J. G. INGRAM, and others, will address the meeting, as well as some of the leading gardeners of the district. We earnestly commend the example of Wolverhampton to other districts.

DEFINITE RULES FOR JUDGING.—We understand that the Royal Horticultural Society has resolved to form a committee to consider the circumstances attending the exhibition of flowers, fruit, and vegetables, and to prepare a code of rules as a guide to exhibitors and judges. The code will be circulated under the auspices of the Society, and we may express the hope that other societies will accept the same rules. Something of the kind is very much needed.

SANDAL-WOOD IN JUAN FERNANDEZ.—Professor PHILIPPI has sent to Kew specimens of a new species of Santalum from the island of Juan Fernandez.

PLANT PORTRAITS.

DAHLIA BLANCHE KEITH, *Illustration Horticole*, t. xx.—A yellow Cactus variety sent out by Mr. T. Ware.

MAXILLARIA SANDERIANA, *Revue Horticole*, November 16.

MICONIA VELUTINA, *Illustration Horticole*, t. xxi.—A Brazilian Melastomad, with dark-green bullate leaves, wine-purple beneath.

EUCHARIS GRANDIFLORA.

LARGE specimen plants of the beautiful white Amazon Eucharis are numerous, and some have from time to time been noticed. The one shown in the accompanying illustration (fig. 85, p. 665) is certainly entitled to rank amongst the largest, and not the least interesting. It is still in bloom, but of course not just so freely as when the picture was taken, early in November, and may always be seen in one of the Orchid-houses at the Briars, the residence of Mrs. W. L. Barclay, at Reigate, Surrey, where its huge dimensions and exceeding weight render it a comparative fixture. It has reached its present stage of development under the care of Mr. Bailey, the well-known gardener there, and has been undisturbed in the present pot for some fourteen years. Many years since, as a single bulb, it came into the hands of Mr. Bailey's predecessor at the Briars from Mr. W. Bull's Chelsea establishment. It was even grown for some time in a pot by the gardener's wife, who petted it, but eventually handed it over to her husband who shifted it, grew it on, and finally, even before Mr. Bailey succeeded, had got it into its present huge receptacle. This pot is some 27 inches across, and of the same depth, literally as big as an Orange-tree tub, and the pot, soil, and plant weighs several hundredweights, so that size and weight combined render it very difficult indeed to remove for any purpose. Its present position is on the top, and at one end of a raised brick bed that runs through the centre of the span Orchid-house. At the moment when the picture was taken the flowers, expanded and otherwise, were 350, and borne on sixty-six stems. The head from tip to tip of leaves is almost 8 feet, and in every respect the whole is in rude health. Many of the flowers reach to a breadth of 4 inches. In one case Mr. Bailey mentioned that a bloom had eight segments or petals, and was of abnormal size. Within the pot the bulbs are crowded one on to the other in a mound or cone, much like what is seen in a clump of a Cœlogyne; and the opinion is held by the gardener, that nothing so much tends to preserve health and cleanliness as the keeping of the bulbs out of the soil in this way. Of course, water is liberally given generally, though certain periods of restfulness are allowed. Then liquid manure, made from soot, guano, &c., is given too, and occasionally a mixture of Smyth's blood-manure and fine soil is thrown about the bulbs and well washed in about the roots. When the present bloom is over, the plant will be allowed to become partially dry, and have a short rest, then again be thoroughly saturated with water, and a fresh lot of flowers will be produced soon after Christmas; then again in the spring and summer, the greater bloom always being in the late autumn. How much longer in an unbroken condition the huge congeries of bulbs will continue to do well in the one pot it is difficult to say, but at present it looks like doing so for several years longer. *A. D.*

AMATEUR'S COLUMN.

PÆONIES.—"Now is the time to plant Pæonies," so say the Messrs. Kelway of Langport, and with them I agree; and further, it has often been a matter of surprise to me that more of these gorgeous decorative plants are not grown. I had collections of the arboreal and herbaceous kinds for very many years, and those I planted of the former, about a quarter of a century ago, are now large shrubs; for although I have left the old garden, I often hear of their beauty. I think there were about forty varieties, but this is as nothing to the number that Messrs. Kelway now catalogue. When I look down the list, I have a longing come over me to see them in bloom. What a sight it must be! Even the foliage without the blossom is elegant and coloury, and in autumn the tints are lovely. I remember one bloom of the Gloire de Rotterdam that I measured, and found it 15 inches in diameter, taking it from base of petal to base of petal. The colour was a gorgeous pink. On a lawn not exposed to the early sun these shrubs are seen to advantage, and seldom suffer from frost.

I have about 250 of the herbaceous kinds, many of which are delightfully scented, and a number are species. The best plan to grow them is in clumps of three, but care should be taken either to have those of equal growth, or the front one of the three to be of dwarf kind. The colours can be varied to suit the taste or the requirements of the position. After blooming, in all cases the fading flowers should be taken off, and the foliage left to fall in due course. The single forms are very showy, and are much admired by some; but, although I like them, I think they are very far surpassed by many of the later new doubles. *Harrison Weir, Iddesleigh, Sevenoaks.*

Fig. 86.—Cypripedium canhamiæ. (see text)
(Malformed flower, with diagram showing the relative position of the parts.)

CYPRIPEDIUM CANHAMIÆ.

The drawing (fig. 86) is an interesting illustration of what a Cypripedium can do in the way of a change, and is suggestive of the phases of development through which ancestral Cypripediums may have passed. The flower in question was sent us by Mr. R. I. Measures, of Camberwell. As will be seen, the inflorescence is two-flowered, and one of the bracts is developed in a leafy condition. The expanded flower shows a curious condition of things—the upper sepal is wanting, the two lower ones are united, and deflexed in the ordinary position. The uppermost petal occupies the position of the absent sepal, and in form and appearance is like one of the ordinary side petals. In addition, two other petals are present at the lower part of the flower in the form of lips. The column in the centre of the flower has a single two-lobed anther, not at the side, but at the upper part of the column, in the position occupied by the solitary stamen of most Orchids. The ovary is one-celled, with three parietal placentas. The interpretation we are disposed to adopt of this highly anomalous flower is the following:—The upper sepal is absent, one lateral petal, one true lip, and two lateral stamens are also absent. On the other hand, there are two supplementary lips in unusual places, and there is a central fertile stamen. The two supplementary lips seem to us to be the representatives of two stamens, and if so, they complete the outer staminal whorl represented by the formula $\begin{matrix} & A1 & \\ A2 & & A3 \end{matrix}$. The three inner stamens $\begin{matrix} a2 & & a3 \\ & a1 & \end{matrix}$ are entirely wanting. Usually, as orchidists will remember, in Cypripedium, the outer whorl, A 1, A 2, A 3, is wanting, or, at any rate, bears no anthers, and the inner whorl is represented by *a* 2 and *a* 3, bearing anthers, *a* 1 being absent.

There is another interpretation possible, and that is, that the two supplementary lips belong to the petaline whorl, in which case we should have one median and two side petals, the two latter developed as lips, and the staminal whorls would be represented by A 1 only. The relative position of the parts, as seen in the fresh condition, induces us to prefer the former explanation.

HOME CORRESPONDENCE.

PEARS CRACKING AND BLOTCHED.—Amongst many other sorts of the finest Pears which I have growing on a very long wall here, 8 feet 6 inches high, there are twenty of Glout Morçeau. Now on this variety, in years not very sunny, the Pears have blackish blotches, and crack, and remain limp, when they should be solid and firm in October. Last year, being very sunny, the fruits were fine and large. The wall faces south, with one and a half hours east in it, that is, the sun leaves it at 4.30 P.M. Now, what can I do to prevent these blotches and cracking of the fruits? *Samuel Sharrock.* [Afford two or three dressings in the early summer with the Bordeaux Mixture. Ed.]

WASHINGTON APPLE.—In reply to Mr. Evans (p. 627), I may say that this variety ripens on the tree with me here, and has a finer colour than when grown under glass. The quality is excellent, and it remains good for some time after ripening. The same may be said of American Mother, a second early dessert Apple, nearly equal to Cox's Orange Pippin in flavour. In connection with these American varieties may be recommended Melon Apple, which keeps well with me until March, and is of fine quality, but like the others it requires a warm soil and situation. A good plan is to pot them in 13-inch pots out-of-doors in the soil on bricks, and with a slight mulch of stable litter on the top of the pots. *W. R., Streatham Hill.*

ADIANTUM CAPILLUS VENERIS CORNUBIENSE.—In a market-garden, on the western bank of the valley through which the Chyandour Brook runs down into the sea at Penzance, the northern end of the garden is separated from the adjoining property by a stone wall 8 or 9 feet high, which was built in 1874. In 1886, this wall was lengthened 4 feet, and a lean-to cucumber-house was built against it. This newer part of the back wall, and the low front wall, have growing on the inside numerous strong plants of the Cornish Maidenhair Fern; while on the older part of the wall not a plant of it is to be seen And further, no plant of this variety has ever been introduced into the house. The clay and stones for building the new walls were taken from the garden in which this house stands, and principally from 2 to 3 feet below the surface. In nurseries at Newton Abbot and Teignmouth, I met with a deeply laciniated form of this Fern, which, I am told, originated with Mr. Harwood, at Kingskerswell, near Torquay. *W. T., Hea Moor.*

NEW ZEALAND.—Having traversed the same ground myself, I was much interested in "A Traveller's Notes" in the last number of your paper, and especially interested in learning the exact mode of growth of the Metrosideros, or Ironwood, as I had previously only heard the colonial version of its life-history. Writing of it recalls a glorious January day, spent in the Otira Gorge, on the west coast of the Middle Island of New Zealand. This gorge is justly celebrated for the surpassing grandeur and beauty of its scenery; its precipitous sides are clad with impenetrable bush, which, when viewed from a short distance, appears habitually of a uniform green, but on this occasion this monotony of colouring was varied, and illuminated by the gleaming scarlet of the Rata (then in full bloom), whose flowers flamed riotously among the tree tops, like a vast far-spreading bush fire. It was unusually luxuriant that season, and it was alluded to with pride by the majority of settlers I met, but they invariably spoke of it as "Rata," not "Raba," and which I should have considered a misprint, if the word had not been repeated, which leaves me in doubt as to the true colonial name of the Metrosideros. *Greymouth.* [Rata is the correct spelling. Ed.]

WHITE MARTAGON LILY.—It may interest the Rev. C. Wolley Dod to know that this fine Lily does well in the south-east of Kirkcudbrightshire, and does not appear to degenerate in soil which can be kept fairly moist. Our climate is, however, a mild one, and more nearly approaches that of Ireland than is the case with Cheshire. The double Martagon also seems to do well in this locality, although in Dumbartonshire the flowers occasionally fail to open. The White Martagon frequently produces fasciated stems here, but I cannot say that I have observed the number of flowers on a stem. *S. Arnott, Carsethorn, by Dumfries, N.B.*

NARCISSUS LEEDSII.—Mr. Brockbank's brief memoir of Edward Leeds is so charming and appre-

ciative, that I scarcely like to follow with a word of modification as to one statement. But, on the principle of *suum cuique tribuendum*, I would point out that it is not correct to call Leeds, absolutely, "the raiser of the Leeds' varieties of Narcissus," or to assert that "the Leedsiis are all his own;" indeed, Mr. Brockbank himself specifies twenty-one of these flowers as due to Edward Leeds; whereas Mr. Barr, in his "Complete List" of 1884, enumerates fifty Leedsiis in all, the difference of twenty-nine having been raised by Backhouse; who is to be credited with the production of the finest of this most refined and beautiful section of Narcissi, to wit, Beatrice, Gem, Minnie Hume, Mrs. Langtry, Madge Matthew, and Duchess of Westminster, this last being the best of all, and a glorious Daffodil. Generally speaking, the Leedsiis of bolder and more erect habit of bloom are due to Backhouse; those in which the perianth and the whole flower are more drooping, to Leeds. From my own, now fairly large, experiments in raising Narcissi from seed, I do not doubt that this distinction is to be attributed to different lines of parentage. I find that the direct cross of the White Trumpet Daffodils × N. poeticus, yields these stouter, more upright Leedsiis, while the secondary crosses of N. montanus × poeticus and N. montanus × the White Trumpets gives the more drooping varieties. I call these secondary crosses, because N. montanus itself is undoubtedly a hybrid between a white Ajax and poeticus—is, in fact, a Leedsii. Among my own many seedlings between N. cernuus, N. albicans, &c., and poeticus, flowers have appeared which are quite identical with N. montanus. No cross produces more beautiful and interesting Narcissi than this. It is most remarkable that in a considerable batch of such seedlings there are sure to be flowers not only white in both perianth and corona, but also some which are of a full yellow in both, although neither parent is yellow in either of these divisions of the flower. The red rim of the corona of the poeticus either disappears in the hybrids, or is represented by a very attractive salmon or apricot tint, such as may be seen in Leedsii Acis, but is much more fully developed in some of my seedlings. Very exquisite Leedsii kinds result from the little Pyrenean N. moschatus × poeticus, some of them like the purest frosted silver, others with cups of rich salmon, but unfortunately they are of frail constitution, and invariably die out. By the way, many of the Leedsiis in cultivation are a notable instance of the additional vigour gained by cross-fertilisation. The white Ajax kinds, such as N. cernuus and albicans, quickly dwindle away in all but exceptional English soils and climate. Cross them with N. poeticus, and you obtain the race of N. Leedsii, most of which are exceptionally robust. I wish that Mr. Brockbank, in his most interesting and successful research into the history of some of our gardening worthies, could find out what became of the hybrid Narcissi which were undoubtedly raised by Dean Herbert, and would also tell us whether any distinctly continental wild species of Narcissus were possessed by Leeds, and employed by him in his crosses. Herbert had a large foreign correspondence, and certainly obtained many bulbs of Narcissus from abroad, some of which he may possibly have passed on to his friends. It is a curious and suggestive fact that among many self-fertilised seedlings from N. Horsfieldi, I have flowered some which are scarcely to be distinguished from the wild N. variiformis. Is it possible that Horsfield possessed this plant? *G. H. Engleheart, Appleshaw, Andover.*

FRUIT AND FICTION.—In total ignorance as to my methods and dealings, Mr. Bunyard declares that I have no "acumen" or capacity for business, because he cannot otherwise explain my failure as a fruit-grower. Let me be as stupid as I may, do not the ownership of the land, the possession of trees in full production, and the experience of forty years place me upon an equality with the cottager or farmer who has rent to pay, trees yet to plant, and faculties—however superior—never yet exerted upon fruit? A friend of mine, of trained business habits, large capital, and vast energy, has lost thousands of pounds in vain attempt to make fruit-growing on a large scale pay, and has abandoned it in despair. So has another gentleman well known to me, and highly valued in this neighbourhood, the owner of a long-established business, large acreage, thousands of fruit trees, and every advantage, except that of fair prices. Upon that last point the whole question turns; and yet it is the one upon which not an answer is vouchsafed to me. I say that Grapes cannot be grown with profit at 1*s.* per pound, nor Pears at 2*s.* per bushel, and yet those have been the prices for a great part of the recent season. Choice fruit has at times fetched more, but all our fruit is not choice fruit; no grower's fruit can all be choice, and if it were, it would cost him more to raise. What we have to consider is, the average price of the entire crop as sold, without any especial advantage—a price obtainable by everyone. Very well; has that been a paying price? I say not, and I defy anyone to contest the point. Moreover, I say that year by year (as the myriads of fruit trees lately planted through this "boom" come into bearing, and importation still increases) prices must become lower and lower, till many a pocket is empty and many a heart broken through this wretched delusion. *R. D. Blackmore.* P.S. Précoce de Trévoux—not Trévouxe—as grown here, is a large and handsome Pear, of the same size and colour as Clapp's Favourite, and in every respect identical, which those who sent it to me cannot deny. Triomphe de Vienne is a nice-looking Pear, and a good cropper, but of poor quality, and ripening with Williams' Bon Chrétien, has no chance as a market Pear with that better and far more popular fruit. *R. D. B.*

—— I am sorry Mr. Blackmore is so hard on my seedling, The Beacon Pear. This year, the fruit was gathered on August 1, and sold for 6*s.* per bushel in the markets; and as the tree forms a natural cordon, and can be planted 6 feet apart for some years without overcrowding, and the fruit can be gathered by women and children, I have found it a profitable variety. The fruit of Magnate has been described as "delicious" this year by a writer in the *Journal of Horticulture*, although he found it but third-rate in other years. *T. Francis Rivers.*

A GREEN SPORT FROM VIVIAND MOREL CHRYSANTHEMUM.—It is somewhat remarkable that two growers of Chrysanthemums residing many miles apart should recently have succeeded in obtaining almost simultaneously a green sport from Viviand Morel. Last week I saw a plant of this sport growing in the conservatories of A. B. Loder, Esq. (gr., G. Underwood), at High Firs, Harpenden. The plant was in an exceedingly healthy condition, having been well grown, and had previously produced four large blooms, all of which were of a beautiful light pea-green colour, and very attractive. When I saw the plant there were many small blooms, and several buds still showing, and all of these had green petals, but slightly darker than the larger blooms. In the immatured condition they appeared specially suitable for button-hole purposes. It may be worthy of mention that a similar circumstance occurred some years ago with the variety Carew Underwood, which was a sport from Baronne de Prailly. *J. J. Wallis, Harpenden.*

AMERICAN NOTES.

(From Our Own Correspondent.)

HONOURING ENGLAND'S ROSARIAN.

SINCE my last letter, there has not been much of interest to English readers till this last week, when a reception and dinner were tendered to Dean Hole. A more hearty and whole-souled compliment could not have been offered. The Dean was in his happiest mood, and charmed his hearers with an ideal "after-dinner" speech. Mr. J. N. May, of Summit, N.J., carried out all the arrangements at short notice, and did well. The *menu* card was most elaborate, being decorated with a Rose (hand-painted), and in the background appeared the tower of Rochester Cathedral, together with a view of the Deanery. Mr. Barry (Ellwanger & Barry), of Rochester, presided, and there were present representatives of all branches of horticulture from widely separated points.

THE ROSE IN AMERICA.

Roses rank differently here to what they do in England; the extremes of heat and cold make it difficult to grow them as your rosarians do, but under glass their cultivation is most successful. They are grown on benches, and I learn that an attempt is to be made to grow blooms for market in this way by a Belgian firm; they have engaged a capable grower from here to teach them how it is done. In a letter I have from the Dean he says, "The treatment under glass is admirable."

A NEW ROSE.

One of the features at the dinner was the "christening" (if such a term may be allowed) of a new Rose, under the name of Dean Hole. This is a sport from Madame Testout, and has a most lovely pale and soft pink flush on white, globular form, and certainly an addition to pale-coloured Roses, especially valuable for bouquet and decorative-work.

CHRYSANTHEMUMS.

There has been a surfeit of Chrysanthemums here (and I suppose with you too). Shows have been held on all sides, the best eastern being at Boston, Philadelphia, Pittsfield, and Newport; further west, at Chicago and Indianapolis. Strange to say, the New Yorkers were unable to organise a display of any importance; yet last year they said they "led the world!"

The blooms shown are of very high merit as regards size, substance, and colour, but they lack finish,—the art of dressing is not understood. Then, again, there is a deficiency of build, which is owing to the rapid growth made, the climate encourages growth too much in the latter part of the season for the growers to get the high centre so much admired by you. Large blooms are obtained from cuttings as late as June. This is no doubt the explanation of the fact that so few varieties do equally well in both countries.

Seedlings, of course, are legion, but as far as novelty goes, they are not specially startling, but there are some very pretty things. Those, however, which approach more closely to the English standard are not generally well received here, with, perhaps, the one exception of Philadelphia, a well incurved flower, of palest sulphur. Mayflower is a promising variety of soft white, and has a strange reflexing of the outer rays. It is otherwise an incurved Japanese. Mrs. Sarah Rose is one of the prettiest of incurved Japanese pinks; Eugène Dailledouze is one of the most successful blooms at the show, its rich yellow colour and large size recommend it (it is on the border line between incurved and Japanese). This variety is run closely by Major Bonaffon, an incurved with good high centre, of lighter colour and earlier.

The blooms are not exhibited on boards, but are shown with a length of from 12 to 18 inches of stem in vases, sometimes singly, sometimes a dozen or even fifty and more in one vase. This may make a fine pictorial display, but renders comparison a difficult matter in close competition. Perhaps the largest bloom shown was H. L. Sunderbruch, at Indianapolis, its diameter being 3½ inches in depth 10½ inches in diameter, and 17 inches over all.

CARNATIONS.

Another turn of fashion when the Chrysanthemum has gone, and everyone is looking towards the reign of the Carnation. Perhaps a word on new seedlings will be in season later. *L. B.*

KNIGHT'S CYPRESS.

CUPRESSUS Knightiana, although comparatively rare and little known, is the most elegant of all the hardy or half-hardy species of Cypress (fig. 87). It was first mentioned, but by name only, in Knight and Perry's *Synopsis Conif.*, 20. Subsequent evidence goes to show that the species or variety is a native of the mountains of Mexico. The botanist will probably consider it as a mere variety or form of Cupressus Benthami, and on botanical grounds we quite concur; but as a cultivated plant the tree is so distinct, and as an ornamental tree so much superior to C. Benthami, that it is necessary to call it by a distinct name. The great beauty of the tree resides in the remarkably regular way in which the herbaceous branches divide, the ultimate branchlets, except those at the extreme tip and base of the shoot being nearly uniform in length. The foliage is of a rich deep green colour, the individual leaves small, regularly appressed, deltoid-ovate acute. The male catkins (B and C) are globular, or oblong spheroid at the ends of the shoots, and of a bright yellow colour. The cones are globose, rich brown, the scales ending

in a conical point. Those shown at E, F, and G, are from trees grown in this country, but others from the south of France, and for which we are indebted to M. Ch. Naudin, are fully half as large again, and in them the whole surface of the scale rises in one conical mass from the very edge to the point, whereas in the British-grown and less perfectly developed cones the conical "umbo" starts from the middle of the scale, and not from its circumference.

If any distinction is to be drawn between this plant and C. Benthami, this character of the cone-scales is the one to which most importance attaches, the ripe cone-scales of the true C. Benthami being

FIG. 87.—KNIGHT'S CYPRESS. (SEE P. 668.)

flattened, with the umbo projecting from the centre only. It is excessively difficult to find characters to distinguish one species of Cypress from another, so great is the amount of variation in habit, foliage, size, and form of cone. The outline of the herbaceous shoot affords useful, but not absolutely distinctive, characters. In the present case, it is linear-oblong, and very regularly-pinnately branched.

C. Knightiana, though considered the hardiest of the Cypresses, is a tree that can hardly be safely recommended for general planting; but in the warmer counties and in sheltered situations it escapes serious damage from frost, or is even quite uninjured. We have received specimens from Hampshire, as well as from Devonshire, Cornwall, and Ireland, and specimens were shown at the Conifer Conference at Chiswick, as well as at the more recently-held Tree Conference held in the same gardens.

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 27.—Considering that the meeting at the Drill Hall, James Street, Westminster, on Tuesday last, was the second during the present month, the number of interesting exhibits was satisfactory, though the Hall was not by any means full.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, C. T. Druery, H. Herbst, R. Dean, H. B. May, G. Stevens, C. J. Salter, J. Jennings, C. F. Bause, R. Owen, G. Gordon, W. Bain, C. Jeffries, H. Selfe Leonard, J. T. Bennett-Poë, C. E. Shea, J. Walker, E. Mawley, C. Noble, E. Bennett, and H. J. Jones.

Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, staged an excellent exhibit of cut Chrysanthemums, in a more artistic manner than is usually seen in this Hall. Similar in arrangement to the collection exhibited from the same nursery at the Aquarium, the blooms were put up in large handsome vases and epergnes, with proper regard to the harmony of the colours. Dried bracken-fronds were used pretty freely, and with good effect; also highly-coloured sprays of Berberis, &c. In the front of the large vases there were staged specimen blooms of a number of novelties, among which we noticed Duchess of York, the largest yellow novelty of the year, which has already been described in these columns. An Award of Merit was given in this case, and also to Madame Carnot. Niveum, Good Gracious, and several promising seedlings were remarked (Silver-Gilt Flora Medal).

Captain Torrens, Baston Manor, Hayes Common (gr., Mr. Pascoe), exhibited some decorative varieties of Chrysanthemums; and Mr. R. Gilbert, Burghley Gardens, Stamford, three very fine blooms of W. H. Lincoln, described as a sport from that variety, and named William Cecil, but it does not appear to be sufficiently distinct.

From Mr. Robert Owen, Castle Hill Nursery, Maidenhead, were exhibited some very fine English seedling Chrysanthemums, and a few continental-raised varieties. Black Prince, a large flat bloom in form, with short petals, and in colour very rich velvety-crimson, was recommended an Award of Merit; and a like honour was given to Owen's Crimson, a flower that promises to make a good exhibition incurved, and to Mons. Meg. Other good flowers were Waverley, a white Japanese (English seedling), Mrs. Seebohm, a white Japanese variety (English seedling), W. Tunnington (English seedling), a crimson incurved with buff reverse; Ruche Lyonnaise (French), an Anemone, of rosy-purple; and M. Charles Molin.

Mr. W. Wells, of Earlswood Nurseries, Redhill, Surrey, exhibited a good display of cut Chrysanthemums and many of the blooms had been cut from plants in 6-inch pots. Mdlle. Thérèse Rey was shown in very good form, Robert Owen, Lord Brooke, and others were equally deserving of notice. An award of merit was given to Madame Carnot, an immense white bloom with good petals, centre of the bloom slighly tinged with sulphur. Tuxedo is a good late decorative variety, reddish-buff in colour. A number of single varieties and blooms of the green sport from Viviand Morel were also shown (Silver Banksian Medal).

Mr. W. Salmon, Elder Road, West Norwood, showed bouquets, baskets, wreaths, and other arrangements of Chrysanthemums (Silver Banksian Medal).

Mr. J. Smith, St. Leonard's Road, Windsor, exhibited some naturally-grown blooms of Chrysanthemum Royal Windsor, a light buff-coloured Japanese, apparently a good one for decorative purposes.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), exhibited a basket of plants of Primula capitata, Loxwood variety, lifted from the open ground. The flowers are a rich purple-mauve. This plant was awarded a First-Class Certificate.

Mr. Thos. S. Ware, Hale Farm Nurseries, near Tottenham, exhibited a pan full of Gaultheria procumbens, and two pans full of the pretty white Narcissus monophyllus (Corbularia Clusii).

Sir Trevor Lawrence, Burford, Dorking (gr., Mr. Bain), exhibited some plants of Reinwardtia tetragyna, very well flowered (Award of Merit). And some plants in flower of Ruellia macrantha. The flowers of this plant are rather more than 2 inches across, and are of a rosy-wine colour, very prettily veined with dark purple. The plant is very free, and good in habit (Award of Merit).

Messrs. F. Sander & Co., St. Albans, exhibited a group of Begonia Rajah, figured in our columns, Aug. 25, 1894, p. 213, and on this occasion the colours in the foliage were more developed; it is a very pretty variety. Also a new type of Begonias, raised from a cross between B. socotrina, with the pollen of varieties of Begonia Rex. The seed was sown in February. The attempt to combine a decorative-leaved Begonia with good flowers like the winter-blooming section, produce promises to be successful. One of the varieties was selected for an Award of Merit, viz., Sanders' Winter Queen.

Mr. Anthony Waterer, Knap Hill, Nursery, near Woking, Surrey, sent about two dozen well-berried plants of varieties of Pernettyas (Bronze Banksian Medal).

A large group of Cyclamens was staged by Messrs. Hugh Low & Co., from their Bush Hill Nursery at Enfield. The plants were all young, and possessed a good number of buds, in addition to a fair display of bloom (Silver Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Sec.), H. M. Pollett, R. Brooman White, Baron Schroder, S. Courtauld, J. Douglas, E. Hill, C. Pilcher, H. Ballantine, H. J. Chapman, and T. Statter.

Baron Schroder, The Dell, Egham (gr., Mr. H. Ballantine), showed Phaio-Calanthe × Sedeniana (P. grandifolius × C. Veitchii), a beautiful hybrid, raised by Messrs. Jas. Veitch & Son some years

ago, but which seems never to have received an award until the present occasion, when it received a First-class Certificate; its tall spikes of pretty cream-white and pink flowers are very attractive. Baron Schroder also showed the clear yellow Cypripedium insigne Sanderiana, a companion of the remarkable C. i. Sanderæ, and which received an Award of Merit.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed a remarkably fine new hybrid in Lælio-Cattleya × Decia (L. Perrinnii ♀, C. Dowiana aurea ♂). The flower resembled more closely the seed parent than the Cattleya aurea, which, except for giving an ample flower, did not appear to have exercised much influence. In the form of the flower, and especially in the abruptly turned-down front of the lip, L. Perrinii was much in evidence, though in point of size it was equal to Cattleya labiata. The sepals and petals were light rosy-lilac, the basal portions white. The showy lip had the base and interior of the tube pale purple colour, with a beautiful network of white lines; the front portion a rich mauve-purple (First-class Certificate). Messrs. Veitch also sent Cypripedium × Milo (insigne Chantinii ♀, œnanthum superbum ♂), in appearance a great improvement on C. × nitens and Habenaria carnea nivosa.

Messrs. F. Sander & Co., St. Albans, contributed a neat group of rare Orchids, among which the various forms of their fine introduction, Dendrobium Phalænopsis Schroderianum were a telling feature, as they are whenever they appear. With them were a grand white form of Odontoglossum crispum, several very fine Lælia præstans, from out of their last importation; the singular Catasetum Christyanum, Cœlogyne Gardneriana, Cypripedium Sargentianum, with rich red-marked yellowish flowers; the singular Epidendrum Laucheanum; some pretty hybrid Calanthes; the very curious Pleurothallis strupifolia, with thick leaves and pretty racemes of purple and white flowers (Botanical Certificate); Cypripedium × Doncasterianum (hirsutissimum ♀, callosum ♂), a fine hybrid, with bright rose-tinted flowers, the petals spotted with chocolate, the largest and best of its class; and C. × J. Bartels (Boxallii × callosum), a very pleasing variety.

M. Jules Hye-Leysen, Coupure, Ghent, showed his new Cypripedium × triumphans (Sallierii × œnanthum superbum. In general appearance it is nearest to C. × Pollettianum. The upper sepal is green, spotted chocolate at the base; then rich rose-purple, with a broad white margin. The petals and lip are yellow, with a reddish-brown, polished surface (Award of Merit). Mr. Hye also sent C. × Madame Marguerite Hye, a very pretty and floriferous hybrid, between C. × Sallierii Hyeanum and C. Spicerianum; and the prettily-spotted Odontoglossum macrospilum.

M. A. A. Peeters, St. Gilles, Brussels, showed a fine plant of Cattleya labiata, Peeter's variety, with many flowers of good size and fine colour, the peculiarity being that the whole flower is very handsomely variegated with purple on clear lilac-rose ground, a handsome bizarre, and constant evidently, for the flowers come from a vigorous plant, while those usually shown with flaked flowers are often more or less diseased (Award of Merit).

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. W. Murray), sent a fine batch of hybrid Calanthes, of which several had previously received awards. They were C. × Sybil, a blush white; C. rubro-oculata, C. × Bryan, white with rich purple eye; C. × Clive, like Veitchii, but with yellow eye; C. × Kenneth, white, with rose centre; C. × Wm. Murray, a grand form with white petals, and rose lip with purple centre; and C. × Harold, a fine thing of the C. Veitchii class, but with broader and brighter rose-carmine flowers (Award of Merit).

Major Joicey, Sunningdale Park, Sunningdale (gr., Mr. Fred. J. Thorne), showed the singular and pretty Serrastylis modesta, Rolfe, n. gen. et spec.; a most remarkable plant of rare interest, as it is the first of an entirely new genus. In growth the plant is much like Oncidium sarcodes, and it bore a drooping raceme of some forty or fifty flowers. The flowers, which were about 2 inches across, had lanceolate reddish sepals and petals, edged with yellow and white lip, marked with purple, the front lobe being linear. A great peculiarity consists in the column having large whitish wings, irregularly notched at the edge, and marked with purple, and in the base of the lip being furnished with similar appendages. It was a discovery of Mr. F. C. Lehmann, and has only flowered once before—with Sir Trevor Lawrence (Botanical Certificate).

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester, showed Cypripedium × Lucienianum, a handsome hybrid, which was figured in the *Lindenia*, and chronicled as a bellatulum cross (Award of Merit).

C. J. Lucas, Esq, Warnham Court, Horsham (gr., Mr. Duncan), sent Odontoglossum Insleayii splendens and O. I. s. aureum, the latter having unblotched, yellowish sepals and petals (Award of Merit).

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed Cypripedium × Zeus (callosum × ciliolare), a very pretty hybrid of fine shape, and with attractive rose-tinted flowers, quite intermediate between the forms used in its production; and C. insigne Richardii, of the Maulei class, but with nearly orbicular upper sepal, the upper half of which was white, with pure purple blotches. The broad petals were profusely spotted with chestnut-brown.

Fred. Hardy, Esq., Tyntesfield, Ashton-on-Mersey, sent flowers of Cattleya Mastersoniæ (Loddigesii ♀, labiata ♂), and Lælio-Cattleya × Tydæa, both of which had been previously certificated; Odontoglossum mulus, Hardy's variety; and varieties of Lælia anceps.

W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), showed a noble plant of the true Cattleya Victoria Regina; an equally good specimen of which was sent by Hamar Bass, Esq., Burton-on-Trent. Mr. Thompson also showed Odontoglossum præstans.

Earl Cowper, Panshanger, Herts (gr., Mr. Fitt), sent Calanthe × Exquisite (luteo-oculata × Turneri), a very pretty white hybrid.

Mr. P. McArthur, The London Nurseries, Maida Vale, W., staged an effective group of Orchids, in the centre of which was the clear-yellow Catasetum Bungerothii aureum, surrounded by good forms of Cattleya labiata and Cypripedium insigne, among which was a curious coppery-yellow form; C. Chamberlainianum macranthum, a very handsome variety; C. × Harrisianum, C. tonsum, and other Cypripediums; Cœlogyne speciosa, Lælia præstans, &c. (Silver Banksian Medal).

Messrs. Hugh Low & Co., Clapton, staged a bright and effective group of Orchids, embracing a great number of forms of Cattleya labiata, Lælio-Cattleya × Schilleriana, Vanda cœrulea, Angræcum sesquipedale, &c. One very interesting plant appeared which resembled Oncidium hæmatochilum, but had foliage as large as O. Lanceanum, between which and O. Carthaginense, it was suggested, to be a hybrid. The pretty cream-coloured lip marked with red at the base, was very attractive (Silver Banksian Medal for the group).

Mr. J. F. Wilkinson, The Gardens, Highlands, Minching Hampton, showed a group of fine plants of Cypripedium insigne (Vote of Thanks).

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, had a neat arrangement, in which were the beautiful violet and white Pescatorea Lehmannii, a remarkably pretty Odontoglossum blandum, Cypripedium × Harrisianum superbum, C. × Pitcherianum Williams' var., C. reticulatum, Cœlogyne Gardneriana, Phaio-Calanthe × Sedeni rosea, &c. (Vote of Thanks).

Hy. Tate, Esq., Liverpool, showed Cypripedium insigne montanum.

H. Grindling, Esq., Harrow Weald (gr., Mr. Rapley), showed Calanthe vestita luteo-oculata.

A. H. Smee, Esq., The Grange, Wallington (gr., Mr. G. W. Cummins), sent Cypripedium × Smeeanum (Argus × villosum), and C. × Dauthierii superba.

S. G. Lutwyche, Esq., Eden Park, Beckenham (gr., Mr. Paterson), staged Cypripedium insigne Lutwychianum, C. tonsum, and Lycaste Skinneri amœna.

Mr. P. Weathers, Silverhall Nursery, Isleworth, showed Cattleya labiata Weathersiana, a nearly white form, with a large and beautifully-shaped flower; and J. Foster Alcock, Esq., Northchurch, Berkhamsted, sent a fine variety of Oncidium Forbesii.

Fruit Committee.

Present: P. Crowley, Esq, in the chair; and Messrs. T. F. Rivers, Dr. R. Hogg, W. Wilks, J. H. Veitch, H. J. Pearson, G. W. Cummins, G. T. Miles, A. Dean, J. Willard, J. Hudson, F. Q. Lane, J. Smith, H. Balderson, G. H. Sage, and T. J. Saltmarsh.

There were but few exhibits before this committee, and no awards were made to novelties.

A large exhibit of Apples was made by Messrs. Charles Lee & Co., Hammersmith Road Nursery, London, consisting of selected varieties of especial quality or appearance. Some of the varieties remarked were Bismarck, Golden Reinette, Golden Noble, Court Pendu Plat, Cellini Pippin, Lady Henniker, King of the Pippins, Worcester Pearmain, Warner's King, Stirling Castle, Manx Codling, Lord Derby, Blenheim Orange, Dumelow's Seedling, and Mère de Ménage (Silver Banksian Medal).

Messrs. H. Cannell & Sons, Swanley, Kent, exhibited a large and excellent collection of Potatos, in about 100 dishes; the tubers, which were the product of field culture, were clean, even, and good (Silver Banksian Medal).

Messrs. H. Lane & Son, Berkhamsted, exhibited half a dozen first-class bunches of highly-finished Grapes (Cultural Commendation), and several specimens of Blenheim Orange Apples, some of which were shown as Red Blenheim Orange, and they were highly coloured, but their origin did not appear.

Messrs. Jno. Laing & Son, Forest Hill, London, S.E., had fruits of two new varieties of Pear, President Drouard, and Fondante de Fondre.

Messrs. Harroway & Scott, nurserymen, Warminster, showed two varieties of Potatos, Sirius and Scott's Maincrop. The former was said to have yielded 5 tons 7 cwt. more per acre than any of the other twenty-four varieties in the experiments under the Wilts County Council at Warminster, and the latter had yielded 240 cwt. per acre in the same experiment, and treated with the Bordeaux Mixture.

Mr. Farr, gr. to A. Peare, Esq., Spring Grove, Isleworth, showed a branch of a free-fruiting Tomato, Farr's All the Year Round.

Lecture by Mr. J. Douglas.

In the afternoon a paper was read by Mr. Douglas on "The Principles of Judging." Mr. Douglas said many of the difficulties that judges are familiar with might easily be prevented by the committee, when framing the schedule, making it as explicit and definite as possible. Reference was made to several cases where dissatisfaction had followed the judges' award. For instance, such indefinite words as "sort" or "kind" should be excluded. They might be interpreted as meaning genera, species, or varieties. In regard to Lilies, which some judges would allow in a collection of herbaceous plants, and others would not, the committee might prevent any trouble by stating in the schedule whether or not Lilies might be included. When the judges have the schedule before them, it should be their business to interpret it literally, and not by any preconceived ideas they may have upon the subject. The lecturer emphatically said that the judges' time should not be wasted by trying to settle such points as could have been settled by a more definite wording of the schedule.

In the matter of fruits and vegetables, difficulties occasionally arose through doubt as to which classes certain fruits could be admitted. A typical one was the Tomato, but the lecturer held that it was better that fruits which were used as vegetables should be classed with them.

The folly of judging fruit by appearance only was dwelt upon, and was declared equal to judging flowers by their scent alone. An unknown variety, especially, should always be tasted. Especially in a case for black Grapes the lecturer had seen exhibits that had been placed first by their colour and size, afterwards relegated to the third place when the fruit had been tasted. Muscats could be judged without tasting, because well-coloured, finished berries of this variety were always of good flavour. Apples and Pears might appear very excellent, and yet be rotten at the core.

Size should not be considered equal to quality, and reference having been made to Gros Colmar Grape, the lecturer said it was perhaps the largest and most handsome of all varieties, but he asked who ate them if they could get others? In a class for Pears, such varieties as Seckle and Winter Nelis should be placed before many finer and larger in appearance, because of their better quality; and in the case of Apples, the same might be said of Cox's Orange Pippin.

In flowers, too, size, in the absence of good form, should count next to nothing, as in Etoile de Lyon, which was generally the largest flower in a collection of Chrysanthemums, should count less than some others, because it lacked refinement. A man who posed as a judge should thoroughly understand the practical culture of all exhibits he adjudicated upon, and he would then know in which bloom or exhibit the greatest cultural skill was manifest.

Mr. Douglas then said, that in a close competition everything should be judged by points, and when a maximum number had been decided upon, care

should be taken to give each item the exact number it deserved, even to awarding the points in halves.

During a short discussion, Mr. A. Dean said that Mr. Douglas had been careful to tread on persons' corns as little as possible, and consequently little had been said but what all could endorse. In regard to the tasting of fruits, though Mr. Dean said he felt he differed from the lecturer a little, and thought that the less high-flavoured Grapes could hardly be ignored, for they were far more refreshing than Muscats, and did not satiate the palate like those of higher flavour. Gros Colmar and like varieties were greatly appreciated by invalids, and the trade thought it one of the very best for the market. He thought then that Mr. Douglas had little reason to ask who ate them. Mr. Geo. Gordon, in the course of a few remarks, protested against the growing practice of dressing Roses, and in regard to the dressing of all flowers he thought we might go back a little and exhibit them more naturally, so that there should be presented before the public the skill of the cultivator rather than the art of the dresser.

The chairman (Mr. C. E. Shea), in proposing a vote of thanks to the lecturer, observed that at the meeting of the Council of the Royal Horticultural Society held that day, enquiries had been made for a code or guide to judges, and he might hint that such was in preparation by that body already, and at the close of this year it was hoped that a code or guide to judges in regard to flowers, fruits, and vegetables, would be followed by the Royal Horticultural Society, and a system started under such auspices would be likely to be followed by others. Several other gentlemen offered remarks.

CUMBERLAND CHRYSANTHEMUM.

November 16.—The fourth annual exhibition of this society was held at Whitehaven on the above date. The quality of the exhibits on the whole was excellent.

The principal exhibitors of plants were J. Gibson Deas, Esq. (gr., Mr. Bell); A. Helder, Esq. (gr., Mr. Thompson); and J. Spittall, Esq. (gr., Mr. Bell), the first-named securing several 1sts, in addition to the National Society's Certificate, for groups of twelve. The plants were, without exception, admirable specimens.

In cut-bloom classes, the chief interest centred in those for Japanese, where the competition was very keen, Mr. Potter, of Whitehall, Carlisle, being the most successful exhibitor.

In addition to carrying off two 1sts, his stand of twenty-four was awarded the National Society's Certificate for the best collection of cut blooms.

Other successful exhibitors in these classes were R. D. Marshall, Esq., of Keswick (gr., Mr. Hartwell), and Jos. Harris, Esq., Greysouthen (gr., Mr. Fixter).

Incurved blooms were only moderate in quality, being, for the most part, deficient in depth.

Mr. James Hay, of Houghton Hall, Carlisle, took 1st for a stand of twelve; and for six blooms of one colour, J. Ritson, Esq., of Maryport (gr., Mr. Tester), was awarded premier position.

Reflexed and Anemone blooms were few in number, though of good quality, and Pompons shown in tall glasses for effect, baskets, and vases of cut blooms, artistically arranged with various foliage, constituted a very attractive and pleasing feature of the show.

SHEFFIELD.

November 16, 17.—The sixteenth annual exhibition of this Society was held in the Corn Exchange, Sheffield, on the above dates, the opening ceremony being attended by a much larger gathering than usual. There was a falling off in the groups of Chrysanthemums, owing to several of the former exhibitors having left the district, otherwise the show was quite up to its usual standard; whilst in the classes for miscellaneous groups, and the local classes for amateurs and cottagers, there was a decided advance both in the number of exhibits, quality, and setting up of the blooms. The paper-collar is still in use here, although much less so than formerly. Another year may witness its departure. How anyone can imagine it adds to the beauty or set-up of a bloom we cannot understand.

Incurved blooms in the open class were not so numerous as on former occasions, probably owing to the adverse summer and damping, which has been such a source of trouble to many this season.

The class for twenty-four incurved, in not fewer than eighteen varieties, brought forth only two competitors, the premier award being easily secured by Mr. C. Crookes, gr. to the Dowager Lady Hindlip, Hadzor House, Droitwich. His blooms were deep, solid, fresh and bright in colour, and well put up. The variety Lucy Kendall won Mr. Robert Owen's Silver Medal for the premier incurved bloom of any variety distributed by him. These blooms would have won in a very strong competition. Mr. J. Jellicoe, gr. to F. H. Gossage, Esq., Liverpool, was 2nd in this class.

Twelve incurved, distinct.—Mr. C. Crookes was again to the front, with first-class blooms; and Mr. J. Vaughan, gr. to S. Brocklebank, Esq., Liverpool, a capital 2nd.

Both the twelve and six incurved bloom classes were very well contested. Six incurved: 1st, Mr. Crookes; 2nd, Mr. J. Vaughan.

The class for twenty-four Japanese, not fewer than eighteen varieties, was well contested, Mr. Wells of Earlswood, Redhill, being awarded the 1st prize; his stands were very even, and contained blooms of good size, well finished, bright in colour, and fresh. Robert Owen gained the Silver Medal for best bloom amongst those distributed by Mr. Owen; 2nd, Mr. G. W. Drake, Cathay's Nurseries, Cardiff.

The best twelve Japanese distinct were from Mr. Alderman, gr. to J. D. Ellis, Esq., Worksop; and the best six blooms distinct were shown by Mr. J. Vaughan. Mr. Jellicoe had the best six Anemones, flowered varieties, and also the best collection of six reflexed blooms. There were also classes for residents within twenty miles of the town, and these were well sustained. Six Japanese: 1st, Mr. J. Vaughan; 2nd, Mr. J. Jellicoe. Six reflexed: 1st, Mr. C. Scott; 2nd, Mr. W. Weaman. Six bunches Pompon: 1st, Mr. C. Scott.

Grapes were better represented than in previous years, Mr. C. Green putting up Gros Colmar, fine in berry, and well finished; and Mr. F. W. Littlewood 2nd. Mr. Green was also 1st with Muscats in the class for white Grapes. Both in the amateurs' and cottagers' classes the competition was keen, and as in each of these eight prizes have to be awarded, the judges had plenty of work to do. There are classes for twelve, six, and three blooms, in both the incurved and Japanese sections, and these were well contested.

Non-competitive Exhibits.—Certificates of Merit were awarded to the following:—Messrs. Charlesworth & Son of Heaton, Bradford, contributed a splendid table of Orchids, interspersed with Palms, consisting chiefly of Cattleya labiata vera, and choice Cypripediums and other plants. Messrs. Fisher, Son & Sibray, a table of foliage and flowering-plants. Mr. S. W. Seagrave, Market Hall, Sheffield, a large group of Palms, Chrysanthemums, and various flowering-plants. Mr. W. Artindale, Sharrow Vale Nurseries, Sheffield, had a very graceful little group of choice Palms, Crotons, and Ferns, interspersed with Spiræas, potfuls of Lily of the Valley, Roman Hyacinths, &c., very nicely arranged.

BIRKENHEAD AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

November 19.—Between fifty and sixty of the leading gardeners of the district, together with a fair sprinkling of the younger members of the fraternity, assembled in the lecture hall of the Y.M.C.A. on the above date to hear from Mr. R. G. Waterman, Treasurer of the Woolton Gardeners' Mutual Improvement Association, a paper on "Mutual Improvement Associations, their Aims and Objects." Mr. James Smith, of the Palm Grove Nurseries, having been elected to the chair, Mr. Waterman proceeded with his paper. He said it was necessary that gardeners should study with zest and determination if they were to hold their position against foreigners, and maintain their high position as a class of honest workers. To assist them in this object a mutual improvement society was very desirable for the interchange of opinions and comparison of results. They might also have an interchange of lecturers with other associations, and a most important adjunct would be a good horticultural library. The paper concluded with some practical advice respecting the details of the working of such societies. A discussion followed, and on the proposition of Mr. W. H. B. Yeo, seconded by Mr. W. Mercer, a provisional committee of eight gardeners was elected to consider the best lines on which an association could be run, and to draw up rules to be submitted to a general meeting to be called later on, with the object of founding a mutual improvement society. The committee consisted of the following:—Messrs. James Williams, W. H. B. Yeo, William Mercer, Peter Barber, George Lyon, Stephen Haines, Lorenzo Maddox, and Thomas Rigg. On the motion of Mr. George Lyon, seconded by Mr. Yeo, Mr. Thomas D. Smith was appointed secretary to the new association. Votes of thanks to the lecturer and chairman brought the proceedings to a close.

P.S.—The lecturer also advocated a class for young gardeners to fit them for the examinations of the Royal Horticultural Society.

TWICKENHAM HORTICULTURAL.

November 20, 21.—The annual autumn show may be recorded as a success. For a group of Chrysanthemums, quality and effect being the leading features, the premier position for a capital lot of plants was assigned to Mr. A. H. Rickwood, gr. to the Dowager Lady Freake; a good 2nd being Mr. J. Simmonds, gr. to Lady Freake.

Twenty-four blooms, twelve incurved and twelve Japanese, distinct.—1st, Mr. C. J. Waite, gr. to Colonel the Hon. W. P. Talbot. In Japanese he had fine flowers of Mons. H. Payne, Mrs. C. Wheeler, L. Carres, and Viviand Morel. Incurved: Violet Tomlin, M. A. Haggas, and Jardin des Plantes. 2nd, Mr. J. Portbury, with a nice lot of flowers.

Twelve Japanese.—1st, Mr. G. H. Sage, gr. to the Earl of Dysart, a beautiful lot, very fine being Primrose League, Beauty of Castlewood, Etoile de Lyon, and Madame Thérèse Rey; 2nd, Mr. T. Osman. Here were fine blooms of Etoile de Lyon, R. Owen, E. Molyneux, and Viviand Morel.

Twelve Anemone-flowered, well-finished examples gained Mr. C. J. Waite 1st position; 2nd, a good lot, Mr. G. Springthorpe.

Twelve bunches Pompons, six varieties, distinct as grown, a very pretty class, Mr. Springthorpe being placed 1st for fine blooms, noteworthy being La Vogue, Madame Moretels, Regulus, and Perle Margaret; 2nd, Mr. J. T. Hoar.

Twelve incurved.—1st, Mr. J. Simmonds, his best flowers being Queen of England, Emily Dale Improved, Madame Darrier, and John Lambert; the same exhibitor taking the special prize for twelve Japanese with, amongst others, fine flowers of Eda Prass, Colonel W. B. Smith, Chas. Davis, and Thunberg.

Six incurved, one variety.—1st, Mr. G. Springthorpe, with fine blooms of Empress of India; 2nd Mr. J. Simmonds, with Emily Dale Improved.

Six Japanese, one variety.—Striking flowers of Louis Bœhmer gained Mr. G. H. Sage 1st place; 2nd, Mr. C. J. Waite, both having fine blooms of Etoile de Lyon.

Bouquets and buttonholes were successfully shown by Miss Cole, Miss Wright, and Mr. A. Pentney.

For six untrained plants (amateurs only), the prizes for good examples went to Messrs. Attwood, Brill, and Lee. In the cottagers' section, the principal prize-takers were Messrs. Hoar, Collett, Gilbert, and Attwood, the cottagers' also making a good display of vegetables.

Groups of Orchids, Ferns, and foliage plants, well-arranged collections, gained the prizes to Messrs. Tracey and Cross.

Baskets of plants arranged for effect.—This was a pretty and attractive feature of the show, the prizes going to Messrs. Warden, Rickwood, and Cross.

Six Palms or foliage plants. Noble examples of Palms gained Mr. J. Simmonds 1st position; 2nd, also a very good exhibit, Mr. J. E. Burton.

The prizes for well-flowered Cyclamens, went to Messrs. Warden, Pentney, and Smith. Primulas also made an attractive exhibit, the chief prize-winners being Messrs. Garrod, Macgregor, and Warden.

Table plants were shown in splendid condition, principallly Crotons, Dracænas, beautifully coloured. 1st, Mr. J. Macgregor; 2nd, Mr. J. Portbury; 3rd, Mr. C. J. Waite.

An interesting class was that devoted to the best ornamental basket or vase of dried seed-pods and berries for winter decoration, the prize-winners for beautiful exhibits being Miss C. B. Cole, Mr. A. Pentney, and Mr. J. Reynolds.

Collection of Fruit.—This class made a good and interesting display. 1st, Mr. C. Griffin; 2nd, Mr. C. J. Waite (we think the positions should have been reversed). Two bunches white Grapes.—1st, Mr. J. Simmonds; 2nd, Mr. G. Springthorpe. Two bunches black Grapes.—1st, Mr. C. Griffin; 2nd, Mr. C. J. Waite. Four dishes Apples (two dessert, two kitchen).—1st, Mr. G. H. Sage, who had very fine fruits of Blenheim Orange, Bismarck, Lane's

Prince Albert, and Ribston Pippin; 2nd, Mr. W. Tayler, who showed well.

Tomatos were well shown by Messrs. Simmonds, Sage, and Griffin.

For a collection of vegetables, Mr. C. J. Waite gained premier place for an extremely fine lot. Specially noticeable were the examples of Ailsa Craig Onion, Sutton's Exhibition Brussels Sprouts, New Red Intermediate Carrot, Surprise Potato, and Autumn Mammoth Cauliflower; good, too, were the collections staged by Messrs. Garrod and Sage.

DOUGLAS, ISLE OF MAN.

November 21, 22.—The society which exists under the title of the Douglas and Isle of Man Chrysanthemum Society, held its fifth annual exhibition of plants, cut flowers, fruit, and vegetables, in the Pavilion, at Douglas, on the dates above-mentioned, and fine weather prevailed on both days. The exhibition was graced by the presence of his Excellency the Lieut.-Governor and Lady Ridgway, and many of the well-to-do people of the neighbourhood. The show was the largest which has as yet been held in the island, and its success was complete, the excellent quality and number of exhibits affording much pleasure to the visitors. A new seedling Chrysanthemum named Lady Ridgway, shown by Mr. Douglas, of the lawn-tennis grounds, received the society's Certificate of Merit. In the open class for Chrysanthemums in pots, some excellent specimens were shown by Mr. Clague, gr. to Dr. Clague, Castletown, Mr. Douglas, the lawn-tennis grounds, and Mr. Curphey, gr. to Rev. F. B. Walters, who shared amongst them the principal prizes.

In the cut blooms competition, Mr. Clague again took the leading position; Mr. Dixon, gr. to Mrs. Clucas, being a good 2nd. The miscellaneous class of plants grouped for effect in a space not exceeding 10 feet by 6 feet, this forming one of the chief features of the show. J. Murphy, gr. to W. F. Moore, Esq., was 1st; F. Gardener, gr. to W. J. Ashburner, Esq, 2nd. Some beautifully-arranged epergnes and baskets of flowers, &c, were exhibited, J. Murphy securing the 1st prize in that class; and Mr. Quinney for one in bouquets. The chief amateur prize-takers were Mr. Quinney, Mr. Quiggin, and Mr. Warner. Special prizes presented by the tradesmen of Douglas were awarded in almost every class. *From a Correspondent.*

GLASGOW CHRYSANTHEMUM.

November 21, 22, 23.—The newly-formed society in the western capital of Scotland, opened their first exhibition on the above dates. The President (Mr. Dewar, of the Botanic Gardens), with his staff on the executive council, laboured assiduously to render the first exhibition of the new Society worthy of such a great horticultural district as that around Glasgow undoubtedly is. So far as a grand display of flowers which filled the city halls, was to be seen, the Society must have reached its highest aspirations. Mr. Renshaw, M.P., opened the exhibition with a very felicitous speech. The leading exhibitor was Mr. Rushton, gr. Cochno House, Duntocher, who obtained 1st for thirty-six blooms (Japanese), in distinct varieties. The exhibit was admitted on all hands to be of great merit, many of the blooms being among the finest yet seen at northern shows. His blooms of J. S. Dibbins, capital yellow; Mdlle. Thérèse Rey, a superb white; and International, received special notice; William Rushton, Princess May, Viviand Morel, President Borel, Henry Jacotat, Stanstead White, Charles Davis, Etoile de Lyon, M. Bernard, Mrs. H. Payne, Mdlle. Marie Hoste, Mr. W. Clarke, Mr. H. Atkinson, Sunflower, Amos Perry, Niveus (a very fine white), were conspicuous in this beautiful collection for fine form and freshness. The 2nd prize exhibit was also of much excellence, and went to Mr. Machar, gr., Broughty Ferry, whose Stanstead White, Charles Davis, Etoile de Lyon, G. C. Schwabe, Florence Davis, Viscountess Hambledon, M. C. Capitante, and Viviand Morel were first-rate blooms; and Mr. Nicol, Rossie Gardens, Forgandenny, was a capital 3rd. Two other lots in this class were most creditable.

For twenty-four Japanese, Mr. Rushton again had an excellent exhibit, and easily took 1st prize; Mr. Lunt, Keir House, Dunblane, was 2nd; and Mr. D. Halliday, Ayr, 3rd.

For twelve Japanese and twelve incurved, Mr. Geddes, of Largs, was 1st. There were other fine noticeable stands in this class, especially those of Mr. Rose, Helensburgh, and Mr. Mathieson, Kirn.

For twelve distinct Japanese, Mr. Rushton again was placed 1st, with a fine exhibit; and Mr. Airdrie, Larbert, was a good 2nd.

Mr. Rushton was 1st for six whites, and held good positions in several other classes. Among pot plants this fortunate exhibitor had it nearly all his own way—the floor of a lesser hall was filled with them.

The side tables were loaded with crosses, wreaths, and other saleable devices, in variety, formed mostly of Chrysanthemums; and Messrs. Thyne had a great display, filling one end of the hall with Chrysanthemums, fine foliage plants, &c.

A Certificate of Merit was awarded to Mr. Airdrie, Larbert, for his new seedling, Mrs. Airdrie, a very fine white Japanese incurved. Mr. Jones, nurseryman, Lewisham, had first for three blooms not in commerce. Mr. Wells, nurseryman, Redhill, Surrey, took 1st prize in the nurseryman's class for thirty-six blooms; and Mr. Campbell, nurseryman, Blantyre, was 2nd.

Two groups of pot plants, arranged tastefully to fill up corners of the hall, were awarded 1st and 2nd prizes to Mr. Dale, Aitkenhead, 1st; and Mr. Archibald, gr., Bothwell Castle, was 2nd, respectively.

There were 400 entries in the competitive classes, and the prize-money amounted to £250; on the whole the competition was remarkably keen, Mr. Molyneux, one of the censors for cut blooms, spoke highly of the excellence of the show. There were long lines of dwarf plants in classes for table decoration, classes for Palms, Ferns, and other popular plants. Roman Hyacinths in lots of sixes, were competed for keenly, and were finer than usually seen at exhibitions. Many of the local nurserymen brought their quota in fine form; Messrs. Austin & McAslan's display in front of the platform was arranged with fine effect, Heaths, Palms, &c., being in fine form. Near to this was a choice display of cut blooms of Orchids, which was crowded by admirers. They were brought together from Bantaskin Gardens by Mr. Mitchell, Mr. Wilson's able gardener; Cypripedium Leeanum superbum, Odontoglossum grande, Cymbidium giganteum, Cattleya labiata, Cypripedium violaceum, C. Harrisianum, and others, were among the best of the exhibit, which were all in bunches.

Fruit.—There was a capital display of Grapes in front of Messrs. Austin & McAslan's plants, which enhanced the excellence of this fine show, and this part of the hall was crowded at all times. There was a trayful of black Grapes, exhibited by Mr. Murray, with bloom as perfect as when they hung on the Vines at Park Hall, and which were justly awarded the 1st prize; they were an imitation of the excellent exhibit of Messrs. Thomson at Edinburgh the week before, and no doubt the transit in this form is more perfect than by any other method of sending to market. Mr. Leslie, Pitcullen, Perth, had a cross-handled basket, and the bunches were tied to the sides; and these Grapes were also in capital condition, the exhibit receiving a 2nd prize.

For the best four bunches of Grapes the competition was strong, and Mr. Leslie secured the 1st place, his Muscats and Gros Colmars being first-rate; Mr. Murray was 2nd, with good produce; and Mr. Maconochie, Cameron House, was a capital 3rd.

Among other prizes, a 1st was awarded to Mr. Leslie, for Gros Colmar and for any other Grape (for which he tabled capital Muscat), and Alicantes. Mr. Lunt, Keir, had large bunches of Mrs. Pince, but they had been rubbed prior to their being tabled. Mr. Murray also had several other leading prizes.

Vegetables were not extensively exhibited, but a 1st prize was taken by splendidly-grown produce from Lenzie by Mr. Delgarno, whose Parsnips, Carrots, Onions, Leeks, Tomatos, and Celery, were of special merit. Other collections in this class were good. Leeks and Tomatos were a capital display.

Mr. Murray tabled his Parkhall seedling Tomato in as fine condition as anyone could desire. (This variety had taken first honours for the same exhibition at Edinburgh). Mr. Harris's Leeks, which he brought from Carluke, were among many fine exhibits, a splendid 1st.

The grand exhibit of Grapes, beautifully-coloured Vine-leaves, and Tomatos, from Messrs. Buchanan, Kippen, were among the best of the ornamental exhibits, and the varied and brilliantly-coloured Vine-leaves was a source of great attraction to visitors. The Grapes arranged in trays were of first-rate quality, and had been carried remarkably well. They received a Certificate of Merit which was justly awarded. Messrs. Smith and Simons, and Messrs. Cunningham and Wyllie had their choicest plants in a line (for exhibition) with Messrs. Buchanan's display, and filled up one side of the hall. It was stated that there were exhibitors from nearly every district of Scotland at this fine exhibition. *M. Temple, Carron.*

NEATH, GLAMORGANSHIRE, SOUTH WALES.

November 22.—This show was held in the Gwyn Hall on the above date, and, notwithstanding no show was held last year, the present one was a great advance on the previous ones; and, taking into consideration the very bad weather and the lateness of the season, the exhibits, especially in the cut-bloom section, were excellent, no finer blooms ever having been seen at Neath. Amongst the exhibitors were such well-known growers in this part of the country as the Earl of Lisburne, Aberystwith; Sir Charles Philips, Haverfordwest; Mr. J. H. Rogers, Llanelly; Mr. E. P. Martyn, Dowlais, Mon.

Competitive exhibits were also good; Messrs. Clibran and Sons, Altrincham, had a fine stand of fruit and cut blooms of the newer varieties of Chrysanthemum; Messrs. Cox Bros., Cardiff; Mr. C. Phelps, Cardiff; Mr. W. Treseder, Cardiff; Messrs. E. Parsons and Sons, Swansea; and Messrs. H. Farrant and Sons, Swansea, were all strongly represented.

The chief prize was for twenty-four cut blooms, half to be incurved and half Japanese (distinct). Mr. Damble, gr. to Sir Chas. Philips, Picton Castle, Haverfordwest, was a good 1st, his incurved being in his well-known finished style; and Mr. Rogers, of Llanelly, was 2nd.

For twelve incurved distinct, Mr. Williams was 1st with fresh and heavy blooms; 2nd, Mr. Mabbott, gr. to Mr. E. P. Martyn, Dowlais.

For twelve incurved distinct, Mr. Williams was again 1st with fresh even blooms, and Mr. Damble 2nd.

For twelve incurved blooms, limited to growers in South Wales and Monmouthshire, Mr. Damble was 1st, and Mr. Williams 2nd.

For twelve Japanese, limited the same as the previous class, Mr. Rogers was 1st; and Mr. Thomas, gr. to Mr. Rees, Swansea, 2nd; Mr. Williams, 3rd.

There were numerous other small classes which were all well filled.

For group of Chrysanthemums, open to amateurs will regular gardeners, Mrs. H. H. Price was 1st, and Mrs. Gwyn-Daffryn, 2nd.

For a collection of Chrysanthemums intermixed with foliage and Ferns, Mrs. Gwyn was 1st.

For a group limited to 7 miles of Neath, 1st, Mr. T. Powell; 2nd, Miss Bevan.

MANCHESTER ROYAL BOTANIC.

November 23, 24.—What was admitted by general consent to be the finest autumn show ever staged in Manchester, took place in the principal room of the spacious Town Hall. Chrysanthemums were the chief feature, but reinforced with such a display of beautiful Orchids, that heightened the colour effect, and contrasted grandly with the beautiful frescoed walls, and the elliptic stained-glass windows, all the more appreciable, too, because of the dull, foggy day. The attendance was much better than we have seen for years, and the golden opinions evoked are sure to tell on future exhibitions.

Plants.

For nine large-flowered Chrysanthemums in pots there was a spirited competition, the best cultivated coming from Mr. T. Hasker, Brook House, Fallowfield, the plants being large-sized and leaved to the bottom—splendid healthy greenery with correspondingly large flowers; Mr. G. H. Gaddum, Adrea House, Didsbury, was 2nd; and Mr. J. C. Cherlton, Didsbury, was 3rd; an extra being awarded to Mr. Heine, Fallowfield. For six Japanese Chrysanthemums in pots Mr. Hasker was again 1st; Mr. R. S. Boddington, Park Lea, Higher Burghton, was 2nd; and Mr. Gaddum, 3rd. The best varieties in both these classes were Etoile de Lyon, W. H. Lincoln, Lord Alcester, Empress of India, Dr. Hermon Page, Sunflower, and Mons. Bernard. For six Pompon Chrysanthemums in pots, Mr. J. Brown, Longfield, Heaton Mersey, was 1st; Mr. T. C. Cleether, 2nd; and Mr. N. A. Earle, Edgemoor House, Kersal, was 3rd. Plants were well grown, but this is a class not so much admired by the general sightseer. The most prominent sorts were Nellie Rainsford, Cardinal Wiseman, and the old Cedo Nulli.

Cut Blooms.

For thirty-six incurved blooms, not fewer than eighteen varieties, or more than two blooms of one variety, Mr. Behrens, Whitchurch, was 1st; Mrs. Banner, Roby, Liverpool, was 2nd; and Mr. Goodacre, Elvaston Castle, was 3rd. The best blooms were A. Salter, Princess of Wales, Baron Hirsch, Golden Empress of India, Lord Rosebery (very full), Violet Tomlin, Lord Alcester (extra), Mons. Bahuant, Queen of England, and C. B. Whitnal.

For twelve incurved blooms, distinct, Mr. Brocklebank, The Hollies, Woolton, was 1st; Mr. T. Stanning, Broadfield, Leyland, was 2nd; and Mr. E. Behrens 3rd.

For twenty-four Japanese cut blooms, there was a good competition, Mr. Goodacre being placed 1st, Mr. E. Behrens 2nd; and Mr. W. Wells, Redhill, 3rd. The more prominent blooms were Primrose League, Lord Brooke, E. D. Smith, M. Henri Roberts, Theresa Davis, Charles Davis, W. H. Lincoln, Madame Carnot, Sir Trevor Lawrence, W. E. Hewitt, Col. Smith, Crown of Flowers, and Charles Buck.

For thirty-six miscellaneous cut blooms, Mr. Brocklebank was 1st, Mr. Wells 2nd, and Mrs. Banner 3rd, with an extra to Mr. J. W. Makant, Bolton.

Orchids.

As to the Orchid display, the post of honour was filled on this occasion by Messrs. Heath & Son, of Cheltenham. Looking at the time of the year, this was a marvellous display of well-cultivated Orchids, while the setting was made up of Palms and varieties of Ferns, enriched with coloured Crotons that told well, and the whole attracted marked attention. Cattleya labiata was abundantly in evidence in many of its choicest coloured forms. There was a rich-coloured Lælia anceps, like a "bowing bush" amongst the crowd; and the chaste paper-white L. anceps, Bull's var., which only lacks size to take forefront rank. There were several choice Cattleya crosses, the most conspicuous among among them being ×C. Mastersiana and ×Lælio-Cattleya Tresederiana. There was a good lot also of Cypripeds, conspicuous among them being C. Sanderæ, a beautiful form of C. insigne; a very good variety indeed this was, with but a few faint spots on the centre limb. C. × Swinburnei was another gem of first water; the Indian-red solid spots on the petaliferous limb invests this with special character. Moth Orchids, and the Dendrobe Moth Orchid, were in the group. This fine collection was awarded a Gold Medal.

Mr. Jas. Cypher, Cheltenham, had a choice lot. His Dendrobium Phalænopsis Schroderianum were in splendid growth, and in excellent variety, one particularly being of large size of flower, which had a rich vinous glow, that entrances the eye of any beholder. There were also some good Vanda cœrulea on exhibit, as well as several good Ladies' Slippers; and that bright, useful Orchid, Sophronitis grandiflora. We were glad to see that Masdevallias are not forgotten altogether; here was a good example of the sepia-brown coloured M. Schlimii, in fine health and inflorescence.

Messrs. Charlesworth & Co., Bradford, had also a very good lot, comprising several excellent species, prominent among them being a brilliant-coloured Cattleya labiata, one or two good Odontoglossum crispum, the beautiful Catasetum Bungerothii, Cypripedium Charlesworthii, and the scarlet Sophronitis.

Mr. Johnson, gr. to Thos. Statter, Esq., Stand Hall, had a splendid assortment of Cypripediums, the chief among them being hybrids. C. × Statterianum is a beautiful thing, and seems to be a good grower; × Southgatense, the spotting here being rich and solid; × Aphrodite, one of the best in respect of having a finish in it of surprising brilliancy—pity its peduncle was not longer; indeed, that is the prime fault with many of our most beautiful hybrids.

Mr. Hinde, gr. to M. Wells, Esq., Broomfield, had a few good Orchids, and he also exhibited the mounted dried flowers for which he had a Silver Medal in London. Mr. Ball, Bowdon, exhibited Cypridedium Sanderæ—not quite so good a form as was exhibited in Messrs. Heath's collection; and Mr. Ashworth, Wilmslow, showed two after the same strain, but not quite so good. These greenish-white Cypripediums are much in vogue now, and command large prices. Mr. O. O. Wrigley showed about 100 cut blooms of Cypripedium insigne taken off mostly different plants, and very effective. The exhibit was showing what a variety there is even in one species of Orchid.

Miscellaneous.

Messrs. Cannell & Sons had a good display of cut Pelargoniums; Messrs. Clibran & Sons, Altrincham, had cut Chrysanthemums, well-grown Roses, set in posies with the stems and leaves attached to them, more novel than beautiful, as the rank leafage does not go very well in this kind of decoration; they had also some excellent coloured and formed Amaryllis, in which the green base is all but obliterated, thanks to the blood of Roi Leopold.

Messrs. Dickson, Brown & Tait had a nice display of Cyclamens set amidst Ferns and Palms; and so had also Messrs. Dickson and Robinson.

Mr. Joseph Brown sent some seedlings from his flower borders at Llandudno, all bright and beautiful; and so did Messrs. Cole & Son, from the same district, consisting of Roses, Wallflowers, Carnations, Gladioli, Centaureas, Lobelias, Snapdragon, Violets, Cyatheas, Coleus, Vines, and Mignonette, forming effective and beautiful poses.

Messrs. Lord, Oakleigh House, had a very effective combination of cut flowers, comprising the choicest stove and greenhouse plants; and Mr. Mason had elegant bouquets loosely arranged and light, both to look at and for a lady to carry—a move in the right direction. Mr. T. Mosley, Halliwell, and Mr. J. Greenhalgh, Bolton, had also good examples.

DUNDEE.

November 23, 24.—The third show of this Chrysanthemum Society was held in the Kinnaird Hall, and was a success. Cut blooms were the most important part of the exhibition, and the Japanese were extensively staged. In the principal class, that for thirty-six, in not fewer than twenty-four varieties, for which a silver cup was offered as 1st prize, there were three competitors; this Mr. Smith, Taymount, West Ferry, won rather easily, with a stand of finely-developed blooms, all of them being fresh-looking, and of good colour. Mr. T. Mackie, Abbey Bank, Arbroath, was 2nd.

The class for twenty-four blooms produced six competitors, and Mr. R. Cairns, Balruddery, Dundee, was the winner of the 1st prize; Mr. Ruckbie, Linfield, West Ferry, being 2nd.

Mr. J. Fearn, Bourtree Bank, was 1st for twelve blooms, Japanese; and Mr. James Grant, Crimonmogate, Lowway, in the class for six, he having grand blooms. Incurved varieties were well shown by Mr. D. Nicoll, Rossie, Forgandenny, in the class for eighteen, for which a silver cup as 1st prize was offered; Mr. Beissant, Castle Huntley, was 2nd. Mr. Nicoll secured the highest award for twelve blooms.

Prizes were offered for a stand 30 by 24 inches, filled with naturally-grown blooms on long stems, arranged for effect in conjunction with any kind of foliage; and here Mr. Grossart, Binrock, Dundee, won the 1st prize, with an arrangement that was very pleasing. Mr. W. Kennedy, Ardarroch, Dundee, had the best grown and bloomed plants of incurved and Japanese varieties.

The arrangements of Mr. W. P. Laird, the Hon. Secretary, were most creditable, and afforded the utmost satisfaction to those concerned.

ROYAL BOTANICAL GARDENS, EDINBURGH.

The following plants are now in flower in these gardens:—

Barleria strigosa.—This Acanthaceous shrub-like plant is a native of India, and as stated in the *Flora of British India*, its habitats reach an altitude of 4000 feet. A plant in one of the beds of the Palm-house in these gardens has been flowering freely for several weeks. The large blue-coloured corollas make it a very acceptable flower at the present season. The plant is about five feet in height, the inflorescences are borne upon short axillary shoots, and sometimes terminally. The green bract-like sepals are very conspicuous. Grown in a pot, it does not attain to its full size, neither does it flower freely, which may account for its rarity in our gardens; otherwise the plant is of easy culture.

Sonerila margaritacea var. Hendersoni.—The silvery, blotched foliage of this plant make it a desirable stove plant at any season; but it is when seen in full flower as it now is that its full beauty is observable. The great number of rosy-pink flowers with their pointed yellow anthers form a pretty harmony of colour with the silvery foliage. In these gardens the plant is grown in a plant-case of about one yard square, and one foot in height, in which is placed a bed of sphagnum moss, no pots or pans being used, and the only requirements are the renewing of the sphagnum, and pinching-out of the tops when the shoots are three inches high, putting these tops into the case, where they soon root, and discarding the old plants.

Sonerila orientalis, is a stronger plant with a stiffer habit of growth. The foliage of a velvety texture, is of a reddish-brown tint, and the flowers are darker in colour. It is a very useful edging plant; for a stove plant stage, a compost consisting of peat, loam, and sphagnum moss chopped up suit its requirements.

Psychotria cyanococca.—The blue-coloured fruits of this plant, which hang in pendent clusters, are just now very attractive in the stove. The flowers are white and inconspicuous, but the plant has a neat habit, and undulated light green foliage. It is a native of Ecuador, and was introduced in 1870, and is of easy culture. It is propagated from half-ripened shoots.

Bignonia venusta.—Too much cannot be said in praise of this lovely Brazilian species. A fine plant trained on the roof of the Palm-house is putting forth its lovely orange corymbs of flowers. It is a fast grower, and our plant, which is planted under the stage in loam, was, when turned out of its pot last year, quite small, but shoots now measure nine or more yards in length. At Edinburgh it never requires to be shaded, and the well-ripened wood flowers freely. A fine plant, of great age, is growing at Syon House, Brentford, and the flowering shoots exhibited by Mr. G. Wythes occasionally at the meetings of the Royal Horticultural Society are justly admired.

Pitcairnia Roezlii.—This is one of the brightest-coloured Bromeliads, and an effective plant. The many-flowered racemes rise well above the long foliage; the sepals and petals are bright scarlet in colour, the stamens and pistil just protruding beyond the petals, the stigma being tinged with violet. Raised in the spring, it can be flowered in October or November. It is a native of the Andes of Peru, and was introduced about 1882. *R. L. Harrow.*

GLASGOW BOTANIC GARDEN.

There is always much to interest lovers of plants and flowers in well-appointed botanic gardens, but to attract the general public something special is necessary, and for some time past the Chrysanthemums at the Botanic Garden of Glasgow have given much pleasure to the flower-loving people of St. Mungo. This, we noticed, was strikingly evinced on the above date, which was the second Saturday of the special exhibition. Great crowds flocked to the gardens, especially the Keble Palace, where the choicest of the plants loaded with inflorescence were arranged in the centre of the western dome in pyramidal form. The finer flowers (all were good), were artistically interspersed in order to show their peculiar colours and forms.

It was noticeable that in this choice collection many of the older varieties held their own against the newest comers (this is so at many of the leading exhibitions elsewhere), and those older varieties well-grown, have been the chief prize-winners of the season. Around the group at the Botanic Garden was arranged (with a path between) specimen Palms, Camellias, choice Conifers, Dracænas, &c., with Chrysanthemums laden with flowers interspersed among them. The houses and corridors leading out of this division were likewise filled with Chrysanthemums in standard and dwarf forms, in company with Pelargoniums, foliage, hard-wooded greenhouse plants, sweet-scented Pelargoniums (plants which have been much neglected in many gardens), were much admired, as such always are, by reason of their perfume.

Mr. Dewar (the talented curator), seems thoroughly alive to the need to meet the tastes of the citizens of Glasgow, as well as all other requirements. Among the finest flowers in the exhibition were (whites) Beauty of Exmouth, Etoile de Lyons, Avalanche, White Globe, White Venus, Viviand Morel, Stanstead White, Ethel Paul, Condor, Jeanne d'Arc, Bouquet de Dame, and Mr. Campbell. The yellows were very brilliant, and well represented. W. H. Lincoln, Peter the Great, Golden Queen of England, Sarah Owen, and some fine varieties among the Anemone and Marguerite classes gave capital relief to the larger and more formal varieties. Among other

colours very fine was Dr. Macray, Edwin Molyneux Val d'Andorre, Jewess, Madame Braco, Mrs. Sharpe, Mons. Bernard, Wm. Holmes, Wm. Lane, Amy Furze, and John Shrimpton. We notice among many large growers that selections of the best are preferred to great collections. From the Chrysanthemums we went through the other structures. The large dome of the "palace" was full of shrubs and trees in luxuriant health, and all clean; Camellias full of buds, Araucaria excelsa, A. Bidwillii var. Joseph Napoleon, Palms, Dracænas, &c.; and among the other plants were tall standards of Chrysanthemum var. Little Rose, one of the most attractive plants in the building, loaded with its star-like flowers.

From here, other structures full of healthy plants were traversed, till the Azalea-house was entered. It was filled with specimens, Rhododendron Dalhousieanum, and others of its class in fine form; and Epacris with long growths and finely set with flowers, are well worthy of the position which they occupy. Other houses were filled with choice stove, foliaged plants, Ferns, and Orchids, Lycaste Skinneri, Cypripediums (especially insigne), finely in flower; and Lælias opening.

Other houses we went through were filled with succulents. Stove and greenhouse plants were most creditable to all concerned, by reason of health, cleanliness, and order. *M. Temple, Carron.*

CULTURAL MEMORANDA.

SOME NOTES ON THE CULTURE OF TREE CARNATIONS.

HAVING studied the requirements of these plants for some time, I may be allowed to make a few remarks in regard to my methods of cultivating them, but with which I have no doubt many will already be well acquainted. The old plants are layered about the end of July or beginning of August, and the layering is done in a cold frame. After layering I keep the sashes on for a week or so, shading the plants on bright days, gradually admitting light and air, till in about ten days after layering, I leave them uncovered altogether. In about a month or six weeks the layers are well-rooted, and I pot them into 3-inch pots, using a compost consisting of loam one part, leaf-mould two parts, and one part of sharp sand. I then place them into a cool-house or frame, where they are not long in filling their pots with roots. When their roots have thoroughly filled the new soil, they are re-potted, this time into 6-inch pots, using for a compost two parts good loam, one of exhausted mushroom-bed material, and one of old fern roots, adding charcoal, sand, and some artificial aid, such as Cross's or Thomson's Vine and Plant Manure. The plants flower in these pots in June or July, throwing up one spike, or perhaps more. After flowering is passed, I cut back the flower-spikes, and re-pot into 10-inch pots in a like compost to the last, and then I have nice bushy plants for the following year. To some gardeners the shift from a 3-inch to a 6-inch pot may seem too large, but I find that the plants do best when given a large shift. Green and black-fly are great enemies of the Tree Carnation, and my method of dealing with these pests is to dust the plants with tobacco-powder, and syringe them a day or two afterwards, laying the plants on their sides when doing this. In winter I keep the temperature for them about 45° at night. *J. B. Crichton, Meadowbank, Kirkminton.*

VEGETABLES.

PEA DUCHESS.

THIS variety is highly thought of as a summer Pea. I look upon this Pea as being superior even to Duke of Albany, and it has the great merit of coming into use late. I have been gathering Peas from a sowing made at the end of the month of June; excellent produce for the season. Instead of growing as usual between 6 and 7 feet high, the plants are not above 5½ feet. *E. M., October.*

A GOOD LATE PEA.

This description may be fairly applied to Sutton's Latest of All green Marrow, from which variety the gardener at Orchard Dene, Ealing, had been gathering pods since August up to the Lord Mayor's day (November 9th), and then there was not the slightest sign of mildew. The peas are a delicate green tint and of delicious flavour. The pods commence setting at the bottom of the plant, and they are thickly produced in pairs over the dark-green haulm. The pods contain from nine to twelve seeds. *J. B.*

LAW NOTE.

(*Before the* LORD CHANCELLOR, LORD MACNAUGHTEN, *and* LORD DAVEY).

LEMMON *v.* WEBB.

THIS was an appeal from a decision of the Court of Appeal, reversing a judgment of Mr. Justice Kekewich, who decided in favour of the present appellant. In 1869 the appellant purchased a property called Malquoits, situated near Guildford, in the county of Surrey, and comprising about 21 acres, and in 1879 he purchased another estate, called Ewhurst Place, of about 106 acres, the boundaries of which marched with those of Malquoits. In 1878, the appellant sold Malquoits to the respondent. At the time of the purchase by the respondent of the latter property there were growing on the boundary of the two estates, but upon the land of Ewhurst Place, a number of large timber trees, the branches of which overhung the land and soil of Malquoits. The respondent, without giving any notice to the appellant, after he took possession of Malquoits, proceeded to lop off the branches of the trees that overhung his land, whereupon the appellant instituted the present proceedings with the object of obtaining a declaration that the respondent was not entitled to cut any branches of the appellant's trees which overhung the respondent's land when such overhanging had continued for many years, for an injunction to restrain the respondent from cutting the branches, and for damages. The action was heard before Mr. Justice Kekewich, who ordered the respondent to pay the appellant the sum of £5 damages and costs. The respondent having appealed, the Court of Appeal reversed the decision of Mr. Justice Kekewich, and gave judgment for the respondent. The appellant now sought to have the decision of the Court of Appeal reversed, contending that notice was necessary before the branches could be cut.

Mr. Warmington, Q.C., and Mr. R. F. Norton appeared for the appellant; and Mr. Marten, Q.C., and Mr. J. Bradford for the respondent.

At the conclusion of the arguments for the appellant, their Lordships dismissed the appeal, being of opinion that the respondent was not bound to give notice before abating the nuisance.

Appeal dismissed with costs. *Times, Nov.* 28.

ENQUIRIES.

"*He that questioneth much shall learn much.*"—BACON.

PERRY.—The Rev. G. H. ENGLEHEART, Appleshaw, Andover, will be much obliged if any reader will give him a practical receipt for making "Perry" out of a few bushels of Pears, without any proper mill or crushing machinery; but, if feasible, simply by the use of ordinary kitchen tubs, &c.

COVENT GARDEN.—When did Covent Garden first become a market? *Ignoramus.*

THE WINDLESHAM NURSERIES BAGSHOT.—Messrs. PROTHEROE & MORRIS, who have recently sold these well-known nurseries which were formerly carried on by the late Mr. R. MASON, conducted last week a highly successful six days auction sale of a portion of the nursery stock which extended over 30 acres. These nurseries have been noted for Rhododendrons, Acacias, and young Conifers. The sale was probably the most important and largest that has taken place for many years, the attendance being large, and competition brisk throughout the six days.

Obituary.

JAMES COCKER, JUNIOR.—We regret to announce the death, at the age of thirty-nine years, of Mr. James Cocker, Junior, of Messrs. J. Cocker & Sons, nurserymen, Aberdeen, which took place at his residence, 91, Leslie Terrace, in that town, on Wednesday, November 21. He is survived by a widow and family of five young children.

MARKETS.

COVENT GARDEN, November 29.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

The demand for the best samples has much improved since our last report, as well as for good quality tubers from dark soils. Beauty of Hebrons, first quality, 95*s.* to 105*s.*; Snowdrops, do., 95*s.* to 105*s.*; Main Crop, do., 95*s.* to 105*s.*; Imperators, do., 80*s.* to 90*s.*; Bruces, do., 80*s.* to 90*s* Magnums, do., 70*s.* to 80*s.*; do., dark soil, 65*s.* to 70*s.* ordinary sample, 55*s.* to 60*s.* *J. B. Thomas.*

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending November 24, and for the corresponding period last year:—1894: Wheat, 19*s.* 11*d.*; Barley, 22*s.* 4*d.*; Oats, 14*s.* 3*d.* 1893: Wheat, 27*s.* 1*d.*; Barley, 28*s.* 9*d.*; Oats, 18*s.* 3*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 128*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 60*s.* to 105*s.*; do., inferior, 38*s.* to 60*s.*; mixture 90*s.* to 105*s.*; and Straw, 22*s.* to 38*s.* per load.

SEEDS.

LONDON: *November* 28.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that American cables quote Red sixpence and Alsyke eighteenpence dearer. White Clover-seed exhibits increasing weakness. No attention is given to Trefoil or Rye-grasses. A further advance is asked for Scarlet Runners. Giant Haricots keep scarce and strong. Peas are still slow. There is no change in either Canary or Hempseed. Rapeseed hardens in value. The new Kœnigsberg Tares come cheap and good. Linseed is improving. Mustard unaltered.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 24, is furnished from the Meteorological Office:—

"The *weather* continued somewhat changeable, with occasional rain during the earlier part of the period, but subsequently became drier and more settled than for many weeks past. Bright aurora was observed on several occasions over the extreme north of Scotland, and a very brilliant display over all the more northern parts of that country on the 23rd.

"The *temperature* was above the mean in all districts, the excess varying from 1° in 'England, E. and Ireland, S.,' to 4° in 'England, N.E. and Scotland, W.,' and to 5° in 'Scotland, N. and England, N.W.' The highest of the maxima were recorded during the earlier days of the week over 'England,' and rather later in Ireland and Scotland, they ranged from 61° in 'Scotland, W.,' to 55° in 'Scotland, E. and Ireland, N.,' and also in 'England, E. and the Midland Counties.' The lowest of the minima occurred on the 24th, when they varied from 21° in 'Scotland, E.,' and 24° in 'Ireland. N.,' to 34° in 'England, N.W.,' and to 40° in the 'Channel Islands.'

"The *rainfall* was less than the mean in all districts, the deficit in most instances being considerable.

"The following additional information has been received concerning the rainfall in Dorsetshire for the preceding week. At Cattistock and at Hazelbury the amounts measured between the 11th and 14th were 5·06 ins. and 6·63 ins. respectively, while the amounts recorded from Oct. 20 to Nov. 16 were 13·45 ins. at Cattistock, 14·73 ins. at Godmanstone, and 16·28 ins. at Hazelbury.

"The *bright sunshine* varied a good deal in amount in different parts of the country, being above the mean in most of the southern and northern districts, and below it at most of the western stations and in 'England, N.E.' The percentage of the possible duration ranged from 39 in 'England, S.,' and from 28 in the 'Channel Islands,' to between 10 and 18 in 'Scotland,' to 7 in 'England, N.W.,' and to 6 in 'England, N.E.'"

NOTICES TO CORRESPONDENTS.

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

BONÂ FIDE COTTAGER AND AMATEUR: *S. W.* One who is not a gardener by profession; and who does the work of his garden with his own hands, or at the most only employs an unskilled labourer for the digging and other heavy jobs. A coachman and gardener is not an amateur. A cottager might possess a small heated greenhouse without ceasing to be a cottager exhibitor. It is extremely difficult to frame a rule that shall fit all cases. Cases of doubt should be decided on their merits by the committee.

CATTLEYA, DENDROBIUMS, AND ODONTOGLOSSUM (CRISPUM?), &C., IN WARDIAN CASES: *W. B.* We have no confidence in any system of Orchid culture carried on in one Wardian case. For one thing, three separate cases would be required for the genera you mention, their treatment being dissimilar; and we do not believe that the necessary amount of ventilation could be secured. Moreover, the variations of temperature would be as erratic as those of the rooms in which they stood, and would necessarily be very great, and consequently injurious to the health of the plants. "Spot" would also be a plague that would have to be contended with. Camellias and Rhododendrons might be forced into bloom in such cases, but the plants would not remain in health if kept a long time in them.

COVENT GARDEN: *Ignoramus.* The name is a corruption of Convent Garden, of which the present market occupies the site.

CELERY: *H. J. F.* The leaves are first attacked by a fungus, Cercospora apii, Fres.; then, owing to lowered vitality, the "heart" of the Celery is attacked by "eel-worms," which are present in immense numbers. The diseased plants should be burnt, and the soil disinfected. *G. Massee.*

CHRYSANTHEMUM: *M. P. B. G.* The bloom you send appears to be that of Empress of India grown without thinning, and minus its chief characteristics.

CHRYSANTHEMUM SHOW: *F. M.* 1. Yes; there is no reason why the disqualification in the one case should affect the best bloom in the show. 2. We cannot say what happened in 1892. It is already ancient history.

COX'S POMONA APPLE: *C. R.* It is both a culinary and dessert variety.

FIVE OF THE BEST PEACHES AND THREE NECTARINES FOR FORCING: *A Reader.* Alexander, Waterloo, Hale's Early, Early Grosse Mignonne, Violette Hâtive (English Galande); Grosse Mignonne. These varieties ripen from July to September, in the order of their names. If you like novelties, plant Early Rivers instead of Alexander; and Early Silver, a very large fruit, might take the place of Hale's Early. The Nectarines might consist of Advance, Dryden or the Improved Downton, and Spenser. These are new varieties; older ones are Violette Hâtive, Elruge, and Hardwick.

JAPAN ANEMONE: *X.* The outermost sepals are developed in the guise of leaves. We do not remember to have seen this change before in this plant, though it is common enough in other plants.

LYCASTE SKINNERI: *N. B.* It is, as you remark, an unusual occurrence for two flowers to grow on one spike.

NAMES OF FRUITS: *M. P. B. G.* Pear, Winter Nelis.—*Cider.* 1, Cellini; 2, Claygate Pearmain; 3, 4, 5, poor, bruised examples; we cannot identify them.—*H. H. H.* 1, Easter Beurré; 4, Beurré d'Aremberg; 5, Beurré Diel; others not recognisable.—*W. G.* Chaumontelle true.—*L. J. G.* Very similar to Queen Caroline.

NAMES OF PLANTS: *Derrywin.* 1, Garry elliptica; 2, Rhus Cotinus, Wigtree.—*W. W.* Phœnocoma prolifera Barnesii.—*J. C. S.* 1, Boletus bovinus; 2, Tremella frondosa; 3, Lælia lubrica; 4, probably Hygrophorus discoideus, but no information given; 5, Ag. (Flammula) sapineus possibly, but no locality given; 6, Dacrymyces deliquescens. *M. C.*—*G. T.* Cratægus coccinea.—*W. T. Burton.* 1, Cymbidium giganteum; 2, Vanda suavis; 3, Vanda tricolor; 4, Phalænopsis Schilleriana. The variety of Odontoglossum crispum is not a good one.—*J. F.* Should address the Editor. 18, Sedum Sieboldi; 17, Cupressus funebris; 16, Retinospora squarrosa, grown under glass and out of character. The others will be named next week. Another time do not send more than six.—*M. K. G.* 1, Salvia involucrata; 2, Dracæna metallica; 3, Cheilanthes lendigera; 4, Asplenium bulbiferum biforme; 5, Pteris argyræa; 6, Nephrodium molle; 7, Polypodium aureum.—*A. M.* 1, Cyperorchis elegans, syn. Cymbidium elegans; 2, Bambusa Fortunei variegata; 3, Carex variegatus; 4, Panicum plicatum; 5, Chamæranthemum igneum.—*C. Walker.* 1, Salvia involucrata; 2, Send when in flower.

TACSONIA VAN VOLXEMI: *C. W., Norwich.* Doubtless the roots of the plant are in an unhealthy condition. In February you should examine the state of the soil, and the roots; the border may be found to require entire renewal. If that should be the case, excavate the whole to a depth of 1½ to 2 feet, and put in clean drainage-materials to a depth of 6 or 8 inches, and fill up with good fibry loam two-thirds, peat one-third, and a little leaf-mould, and plenty of sharp sand. Use the soil in a roughish lumpy condition. Prune off the decayed roots back to healthy tissue, and, shaking off most of the old mould, and replant not deeper than 2 to 3 inches below the surface. Tacsonias and Passifloras require roomy root-runs, say 8 to 10 feet square, and a depth of 1½ feet of mould.

THE USE OF ELECTRIC LIGHT IN FORCING VEGETABLES: *W. G.* We are unable to find any notice of experiments in this direction carried out at the Columbian Exhibition. The more recent accounts of electricity used as an illuminant in forcing-houses during the winter season, will be found in *Gardeners' Chronicle* for August 20 and October 15, 1892; and September 2 and 30, 1893. The first two refer to American experiments.

YORK CHRYSANTHEMUM SHOW: *J. Lazenby.* As the certificates granted by small provincial societies have small value, compared with those of the Royal Horticultural Society or of the National Chrysanthemum Society, they are seldom given in our reports of shows.

WATER LILIES IN LONDON: *M. S.* The notice to which you refer was in our issue for September 9, 1893, p. 301.

Book of PHOTOGRAPHS } Of Exterior and Interior Views, Sections, Details, Interior Fittings, and Heating Apparatus of Conservatories, Ranges, Vineries, Greenhouses, Stoves, Pits, Frames, &c. The most comprehensive Book on Horticultural Buildings ever published.

CROMPTON & FAWKES, CHELMSFORD.

IT IS IMPOSSIBLE

To issue a full Catalogue of Chrysanthemums until the flowering season is over. If this is done, many of the best are left out, and many worthless varieties recommended. I have, therefore, issued a Preliminary List, which can be had free on application.

My full Catalogue is in preparation, and will again stand alone as the most perfect and useful Guide up to date. This is not only a Guide which Varieties to select, but will also give treatment, such as size of pot, which bud to take out, and will be invaluable to the Gardener as well as the Amateur. It will also contain beautiful Illustrations of New Varieties, as well as several new features, and

Will be posted to Customers free immediately it is ready.

This is produced at great cost, and not being one of those who can give } **SOMETHING FOR NOTHING,** { I will forward it to non-Customers post-free, for seven stamps.

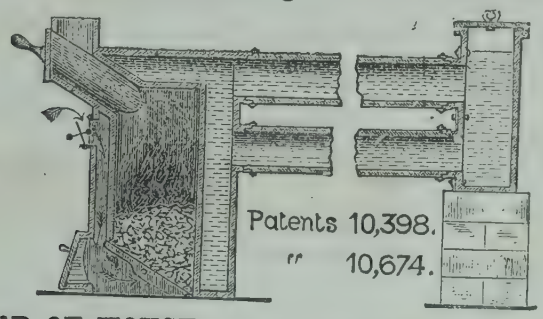
IT IS IMPOSSIBLE

To issue a full Catalogue of Chrysanthemums until the flowering season is over. If this is done, many of the best are left out, and many worthless varieties recommended. I have, therefore, issued a Preliminary List, which can be had free on application.

My full Catalogue is in preparation, and will again stand alone as the most perfect and useful Guide up to date. This is not only a Guide which Varieties to select, but will also give treatment, such as size of pot, which bud to take out, and will be invaluable to the Gardener as well as the Amateur. It will also contain beautiful Illustrations of New Varieties, as well as several new features, and

Will be posted to Customers free immediately it is ready.



This is produced at great cost, and not being one of those who can give { SOMETHING FOR NOTHING, { I will forward it to non-Customers, post-free, for seven stamps.

H. J. JONES, RYECROFT NURSERY, LEWISHAM.

SILVER MEDAL HORSE-SHOE BOILER

(KINNELL'S PATENT).

Section of Boiler showing Action of Hot Blast.

FIX IN END OF HOUSE. NO BRICKWORK REQUIRED.

CHRYSANTHEMUMS.

Our Varieties and Stock are unapproached.

This is well known by the oldest and most successful growers. As an instance, Mr. Mease and many others are again victorious in the great class with those we supplied last season. This unprecedented prize-winning has continued, with hardly a break, for many years. Vigorous and healthy cutting stock is our specialty, not prizes, &c. We have prepared the finest houses (Come and See), of cut-down un-forced plants months ago, which are now full of the loveliest soft root-cuttings, grown near the glass, ever seen, and will strike at once (while others linger for months), and will certainly ensure success wherever they go.

Send for our CATALOGUE, describing 1000 New and Old Varieties—the best kept Collection in England.

SATURDAY, DECEMBER 8, 1894.

CHRISTMAS REQUIREMENTS.

AS London, Brighton, and most of our fashionable towns have their seasons, when a harvest more or less abundant is reaped by the shop-keepers; so, in the gardening world, the market-grower has his "little day," and it behoves him to be ready to meet it with the best that he can produce. After the busy rush of summer supplies is past, there comes a lull in the markets, lasting usually till nearly Christmas time, at which festive season trade seems to take a fresh lease of life, which extends into the first few months of the new year. But it is Christmastide that brings about this revival, and the lull in the autumn must not mean a cessation of labour to the market-gardener, but must be to him a period of serious preparation for the demand for his produce, which he knows he can count upon towards the close of the year.

What has the public learnt to want? for, after all, it is habit that creates demand from the market-grower at Christmas. What vegetables, flowers, and fruit does it ask for? It is the object of this little paper to suggest to those new to the work some of the produce that is always in requisition at Christmas and the new year.

Seakale.—The demand for this luxury really begins about the time of the Lord Mayor's banquet, and a small quantity is always saleable during November and December, though we do not recommend any serious production till Christmas time. Most large growers, we believe, force their Seakale out-of-doors by means of fermenting horse-manure, and covering the beds with litter. In adopting this plan, about one month is usually required to bring the crop to maturity, so that the beds, in order to cut Kale at Christmas, must be started not later than the last week in November. Another method, adopted as a rule where matters are carried on in a smaller way, is to plant the roots closely together in a Mushroom-house or the pit of a Cucumber-house, covering the crop most carefully and scrupulously, so as to exclude all light, with about 1 foot of litter, a temperature of about 55° being maintained by means of hot-water pipes. Seakale can be thus produced in from twenty-one to twenty-four days; the shoots, when ready to cut, should be about 8 inches long, of compact growth, and of a creamy-whiteness to suit the public taste.

Rhubarb.—January calls for Rhubarb unfailingly, and the importation of foreign Apples, though to some extent affecting the price, has not as yet driven it out of the field. The same method may be adopted, in forcing Rhubarb, as has been described above for Seakale; or it will do well in an out-house, covered with leaves or

long manure. Early Victoria is, to our mind, the best kind for forcing. Allow about six weeks for the crop to mature.

French Beans.—This is perhaps the quickest crop to yield of any grown from seed. Beans may be picked, with good cultivation and a reasonable season, in two months from sowing. The most speedy method of raising Beans for winter-cropping is to sow and plant out on a hot-bed in a minimum temperature of 65°. Another, rather slower plan, is to raise the seed in a hot-bed, and to transplant into pots or boxes as soon as the plants have two leaves. Let the soil used be of a good rich composition; keep well watered, and, at fruiting time, supply the plants with liquid-manure liberally. Beans always sell well at and after Christmas, half-a-crown a pound, and even more, being not infrequently realised.

Mushrooms.—This esculent is always a favourite, and the demand at Christmas is naturally large. Get the bed prepared, and of the right temperature for spawning, between 80° and 90°, and allow seven or eight weeks for the crop to reach maturity. Six weeks is generally considered an average period to allow, but so much depends upon the spawn itself, the exact temperature of the bed, its dryness, and other unforeseen events, that two months is not too long to ensure the crop being ready by any particular date.

Strawberries.—There are, and always will be, a few pounds of Strawberries grown for Christmas, but the demand is very limited, and the supply already more than equal to it, so that we cannot honestly recommend the production of this costly luxury at this season. To produce ripe fruit by Christmas entails nearly a year's preparation, ceaseless care and method, and no inconsiderable expense. In our opinion Strawberries in March and April pay infinitely better.

Brussels Sprouts and Artichokes are, as outdoor crops, the next in demand.

Celery has had its day, but Sprouts are called for at every table, and Artichokes always have their value.

Flowers.—Turning to the florists' department, we note first the pot-plants. Primulas are general favourites, and plants of some of the strains propagated by Mr. Cannell, of Swanley, are deservedly popular. In order to get Primulas healthy as well as fine, grow them as coolly as possible. This can easily be managed by a little forethought and a rough calculation as to the time for sowing. Cyclamens are much sought after, and certainly a good corm, with its massive variegated leaves and thickly-clustered spears of bloom, is a cheering sight at a cheerless time of year. Cinerarias—the colours are multitudinous—have a certain fascination for a section of the public, and it is worth while having a few plants ready for the winter festival. To grow them successfully, keeping them free from their arch enemy, green-fly, the plants must be kept in as cool a temperature as is possible, compatible with a steady growth; observing this, they are easy of cultivation. Of bulbs in pots, Roman Hyacinths, Polyanthus Narcissus, and Tulips, are sure to sell—though, unless the bulbs can be bought direct from the growers in Holland, we do not believe there is much profit in their culture.

Cut Flowers.—Christmas and Easter give the Richardias (Arum Lily of the markets) a chance, and the grower who can produce good blooms at this time will not have much difficulty in disposing of them. Roses, of course, and Azaleas are always wanted, Christmas Roses have a ready sale, whilst Roman Hyacinths, Tulips, Freesias, &c., are in great demand. Mignonette sells well at and after Christmas. That never-failing favourite, the Violet (Single, Czars, Marie Louise, and Neapolitan), is especially worth growing for Christmas, and the English flowers, in spite of the Italian and French importations, always hold their own for superiority of scent and quality. We have endeavoured here to throw a little light upon the public taste at Christmas time, and if this short paper meets the eye of any to whom it may contain something that is news, we shall feel that our efforts have not been entirely wasted, and be thankful. *A Market Gardener.*

NEW OR NOTEWORTHY PLANTS.

ADIANTUM CAPILLUS-VENERIS, *L.*

In the *Jamaica Bulletin of the Botanical Department*, No. 34, August, 1892, p. 7, I stated in the footnote to Adiantum emarginatum, Bory, that West Indian specimens of A. capillus-veneris, gathered in Cuba, St. Vincent, and Trinidad, I had verified, possessing the characteristic unjointed pedicels of the leaflets, and that the species was reported as having been gathered in Jamaica in Pedro Cave, St. Ann's Parish, but that I had seen no true specimens, and I therefore did not include it in the flora. That this renowned species, the most interesting of all in the genus, is certainly a denizen of Jamaica, to which country it has been assigned for 200 years on a false specimen of Sloane's, is now and for all time settled. I have in my hands a sheet of four beautiful fronds, absolutely true and characteristic, gathered by Mr. Hart when resident at the Cinchona plantation eight or ten years ago. *G. S. Jenman, Demerara, August* 21, 1894.

Asplenium (Diplazium) tenebrosum, *Jenm., n. sp.*

Rootstock erect or decumbent, finger-thick, but apparently much thicker from the bases of former stipites adhering; the strong, wiry roots extruding between, densely clothed at the apex with linear dark-brown scales; stipites contiguous, a span or more long, very dark, puberulous, channelled, densely clothed like the rootstock; fronds erect, $1\frac{3}{4}$ to $2\frac{1}{2}$ feet long, $\frac{3}{4}$ to 1 foot wide pinnate, the acuminate apex pinnatifid, chartaceous, glabrous, dark, dull, brownish-green; rachis dark, puberulous, channelled; pinnæ spreading nearly horizontally, a dozen, more or less, to a side below the lobed upper part, alternate, oblong-lanceolate, the sessile base truncate, roundly but obliquely-lobed to a quarter or one-third the depth, the acuminate apex serrate, 6 to 8 inches long, $1\frac{1}{4}$ to $1\frac{1}{2}$ inch wide, faced apart, the lower entire ones distant and reduced; lobes $\frac{1}{4}$ inch wide; veins open, few, running in fascicles to the margins; sori 2 to 3 lines long, confined to the base of each pair of the inferior veinlets, often double; involucres narrow, very dark brown. Jamaica. In damp forests of the middle or upper mountain regions. Communicated by Mr. Hart. Differs from all the larger simply pinnate species in nearly all its particulars, especially in the lobing of the margins, character of the venation and sori, and the relatively slender ligneous rootstock devoid of fibre. *G. S. Jenman.*

Nerine × Stricklandii (*Fothergilli* × *pudica*).

Another beautiful garden hybrid, now to be added to those already existing, and ranking with the best of them, has been raised by Sir C. W. Strickland, Bart., Hildenly, Malton, an enthusiast in bulbous plants. Its showy flowers, which are of a very pleasing and uncommon tint, will commend it to general admiration. The plant has broadish leaves; the peduncle is nearly 18 inches high, and bore an umbel of seven flowers on pedicels 2 inches long. The perianth segments are not reflexed, and measure $1\frac{1}{2}$ inch in length, and $\frac{1}{2}$ inch at the widest part, slightly undulate, of a soft scarlet hue with a tinge of reddish-salmon in it. Each segment has a red line bordered with white running up the middle, the red colour growing faint towards the tips. Stamens and pistil blush-white, the latter purple at the tip. In form it comes the nearest to N. × O'Brienii (rosea × pudica). *James O'Brien.*

In the catalogue sent out by M. V. Lemoine et fils, of Nancy, we find accounts of the following novelties:—

Begonia Haageana erecta,

from B. Haageana × B. Scharffiana, unlike either parent, has small dwarf foliage and stiff flower-stems. The stems are short and upright; leaves hairy, bronze-green above, bronze-red below. Flowers numerous, white, tinged with rose underneath; a perpetually blooming plant.

Begonia semperflorens elegantissima alba

is a white variety of a coloured hybrid; the foliage is sturdy, the leaves of average size, firm, bright green, the inflorescences bear many flowers, each with four pure white petals, and very fine. The plant is a perpetual bloomer, and was first shown at the Nancy Exposition last June.

Crassula hybrida albiflora

is a hybrid from C. jasminea × Rochea odorata, and a small plant of erect dwarf habit, not exceeding 10 inches (25 c.) high; leaves fleshy, triangular, decussate, and each stem crowned with a wide corymbose inflorescence composed of many white flowers. A good, floriferous plant, and easily cultivated.

Crotalaria longerostrata.

A leguminous plant, from Mexico; stems semi-woody, bearing ternate dark green leaves, and producing, even when the plants are quite young, long racemes of papilionaceous flowers, more than $\frac{1}{2}$ inch (2 cents.) across, deep golden-yellow, with a brown palmate spot at the base of the standard. This plant continues in bloom all the winter in a temperate-house, and is easy both of cultivation and propagation.

DENDROBIUMS.*

After alluding to some of the most important species and varieties, Mr. Cypher proceeded to explain his system of management:—

Cultivation.—As to the successful cultivation of Dendrobiums, there are several important points that must be strictly adhered to, such as the use of small pots, pans, or baskets, in which to grow the plants. Many growers fail through having too much material about the roots of their plants. They must also have plenty of heat and moisture during the growing season, and be kept perfectly clean and free from all insect pests, such as red-spider and thrips, both of which are very destructive, and soon disfigure the young growths and weaken the plants.

During hot weather the plants should be thoroughly syringed twice daily, taking care to get at the under side of the foliage, where the insects usually attack them. Another important matter is care in dipping the plants, especially during winter and early spring, when the young growths are starting; if great care be not exercised then, and plants are carelessly dipped, many of the young growths will be lost, and the plants thus weakened. They should never be plunged below the base of the plant, and the tender young breaks must by no means touch the water. The best compost I have found to consist of good fibrous peat and fresh sphagnum, in equal parts, with a liberal addition of broken crocks and charcoal, and the soil should in most cases be renewed annually; the roots will not enter sour material.

Thorough good drainage must always be given, and new clean pots or pans, always remembering to use them as small as possible, according to the size of plants. I generally use pans in preference to baskets; the pans are easily broken when plants require shifting, and it is almost impossible to get the plants out of baskets without injuring many of the tender roots; and when one basket is placed inside a larger one, the soil in the small basket becomes worn out, and it is very difficult to replace with new material.

I may also mention that galvanised wire should never be used for suspending any of the choice varieties, the growths being frequently injured by contact with the wires, and should the roof-wires on

* Read at a meeting of the Birmingham and Midland Counties Gardeners' Mutual Improvement Association, Cheltenham, November 19, 1894, by Mr. J. Cypher.

which the plants are suspended be galvanised, they should receive two coats of white paint before any plants come in contact with them. I have several times noticed bulbs of Dendrobes almost ruined by contact with the wires during hot sunshine.

Another important point is a good and continuous supply of rain-water; the plants will not thrive if frequently watered with hard-water, and in all Orchid-houses provision should be made for storing all the rain-water possible, and if in good large open tanks, so much the better.

The water used for dipping should be of about the same temperature as the house in which plants are grown, and this can be secured by having a small tank over the hotwater-pipes. I do not care to have hot pipes constantly running through the tanks, but prefer having a small tank above the hotwater-pipes, to be kept filled up as desired. The Dendrobe-house should also be provided with trough-pipes, and these should be kept filled during the growing season, and should occasionally have a little manure-water and soot placed in them, but taking care that they never become dry, or the foliage may be injured. The floor of the house should also be sprinkled with manure-water twice a week during the summer months, the best time being when the house is closed at night.

Another important matter is to secure plenty of light, Dendrobes enjoy all the light possible and a little sunshine (morning and evening), but must be shaded from the hot sun during the day. Many people say that Dendrobes are so well grown at Cheltenham because we have so much sunshine, but I saw a few Dendrobes, not many weeks ago, at Stand Hall, near Manchester, and I can truly say I never saw any better-grown plants, and Manchester is not blessed with any great amount of sunshine.

There are also some splendidly-grown plants in the collection of Mr. Lee of Manchester, and also at Highbury and The Uplands, both in Birmingham. No doubt they must receive less shade near any large town, and cultivators must use their own discretion, always striving to give the plants all the light possible and a little sunshine, never by any chance use a permanent shade or allow the blinds to remain down during dull periods.

The plants should receive more shade for a week or two after repotting, and very great care in watering, until the roots take hold of the new soil, when they should receive a liberal supply until the growths are matured, when the supply must be gradually withheld and the plants hardened as much as possible to mature the growths, and in autumn the plants should receive only sufficient moisture to prevent shrivelling.

I think many cultivators dry their plants too much, because we are told they receive no water for several months in their native habitats, but I generally notice plants of imported Dendrobes are plump and the bulbs seldom shrivelled, and no doubt many plants are weakened and some almost killed by too much drought in winter. I strongly advise giving plants water immediately they show signs of shrivelling.

I also advise wintering the choice hybrids in a fairly warm house, never falling below 55°. Such varieties as D. Bensoniæ, aureum, lituiflorum, and all the Australian and New Guinea Dendrobes should never be placed in a cool house, but be kept warm and dry during the resting period. The plants retaining their foliage always make better and much stronger growths than those allowed to lose their leaves (I allude to the Australian Dendrobes).

Dendrobium Dearei should never be kept dry nor placed in a cool house. It appears to grow and bloom all the year round, and should on that account be kept moist.

D. Jamesianum and infundibulum are not usually seen in good condition. They should be grown cool and moist during summer, and in autumn placed at the cool end of the Cattleya-house and kept moist to mature their growths, which are not in some plants fully matured till the spring, and at once produce their flower-buds.

D. formosum is a grand autumn-blooming variety, which requires plenty of heat and moisture during the growing season, and well repays the grower by producing its splendid blooms during autumn, when choice white Orchids are scarce.

D. Bensoniæ is considered a very difficult plant to cultivate for many years, but I have grown it for eight years, and had finer bulbs at that period than when plants were imported; and I believe many or nearly all are lost by having too much water during winter and early spring, and even when the new growths are several inches long, they should receive very little water. Red-spider should also be kept in check; it seems to have a particular fancy for this variety, and soon injures the tender young growths if not checked immediately it makes its appearance. This should be done by sponging the under side of the leaves with weak Fir-tree oil and water.

D. Falconeri is another plant that seems subject to the attacks of red spider, and should be carefully watched. I find it grows best when kept rather cool and shaded during summer, and well saturated with water. More light to cause the plant to ripen should be afforded in autumn, and the plant kept dry and cool during winter, to induce them to bloom freely. It is, no doubt, one of the handsomest Dendrobes when in bloom, and well repays any care bestowed on its cultivation. The variety delicata or albens is almost white, and a very beautiful and scarce variety.

No doubt the nobile section are easiest to cultivate, and are all beautiful when in bloom, especially such varieties as D. nobile nobilius, D. n. Cooksoni, D. n. pendulum, D. n. Hardyanum, D. n. Cypheri, &c.

It is not necessary to have a house specially devoted to Dendrobes; anyone having a warm plant-stove may cultivate many varieties to perfection. I have often noticed better specimens in ordinary plant-stoves than in a mixed house of warm Orchids, or in houses specially devoted to Dendrobiums, and they produce a beautiful effect, hanging in bloom from the roof of any plant-stove.

PEACH CULTURE IN BELGIUM.

Some interesting facts relating to the culture of Peaches in Belgium are to be found in the recently-published report of the United States Consul at Liège. It appears that the kingdom of Belgium after supplying a population of 500 to the square mile, exports 105,000,000 lb. of fruit. The value of foreign shipments last year amounted to about £600,000.

A very large proportion of the fruit shipped consisted of Peaches. Mr. Smith, the United States Consul, gives an account of the methods of grafting and budding in vogue in Belgium. A long series of experiments, to ascertain the best stock on which to bud, were tried again and again upon all varieties of Plum, Apricot, Sweet and Bitter Almonds, every tree in fact of a kindred nature; till the conclusion was reached that the best stem for grafting was the Red Plum. This hardy plant, whose roots spread wide and strike deep, imparts much of its own vitality to its foster scions. Grafting or budding is done out-of-doors so as not to weaken the young tree by accustoming it to unnatural conditions. The next question to be considered is that of soil. In sandy and dry earth it was found that neither the plant nor the Peach flourished; the one being spindly, and the other small, while in rich and moist alluvial soil the tree prospered at the expense of the fruit. A calcareous soil, neither wet nor dry, is preferred by the Peach, the young trees requiring a great deal of lime.

As it is impossible to tell, without chemical analysis, the exact amount of this element contained in any given quantity of earth, its application must be more or less experimental. The rule in Belgium is to first thoroughly fertilise the soil with manure, and then, after planting the tree, to add a peck of lime to every cubic yard of earth, placing it near the surface. As it is necessary to loosen the earth for at least 6 feet square, and 3 feet deep, this quantity—a bushel to a tree—may seem large, but the authorities in Belgium are all agreed that more, rather than less, would be better. The application should be repeated every three years.

Turning from the standard tree, which too often failed to be profitable, Belgian agriculturists experimented with espaliers or wooden railings, but these were found to be so open and exposed, that the young trees fared very little better than in the orchard. They next tried the wall, not as in some countries, where mural enclosures are built at great expense for the special protection of delicate fruit, but the sunny sides of their houses, and this met with such astonishing success, that there are few houses to-day in Belgium upon whose southern exposed side trees are not trained. No château is too grand, and no cottage too humble, to furnish them protection and support. Mr. Smith says that last summer he saw ripening upon the gable-end of a town-house, a surface of about 30 feet square, over 2,300 Peaches. There were four trees, two of them with dwarf stems, not more than 12 inches high, and branches 6 feet long, radiating like the ribs of a fan; and two "riders," or bushes grafted upon tall stocks, whose boughs began to spread where the others terminated. At the time of flowering, it is always necessary to shield the buds from the action of frost, and this is done by various methods, the best of which experience has shown to be the placing among the upper boughs of the trees, branches cut from other green trees. This plan has been attended by good results, though it should be employed with caution, as too much shade is apt to stifle the buds, by excluding the rays of the sun.

Another method, until recently very much in vogue, and always effective, is the employment of mosquito-netting or other cheap material, with meshes large enough to admit the free passage of light and air. The old custom of using closely-woven cloth, like table or bed-linen, at night, and removing it in the morning, is said to be more dangerous than the frost itself, as the trees at this season cannot be deprived of air without serious injury.

In addition, this artificial heat at night, succeeded by the warmth of the sun, hastens their flowering, when the object is to delay it as long as possible. Shading at noon is sometimes as essential as covering at night. The poor succeed very well in protecting their fruit by placing a number of horizontal poles about 18 inches apart, and from 4 to 6 inches from the trees, and covering them with light wisps of straw. In good situations, penthouses will sometimes suffice to protect the fruit; in any case, they are extremely useful in checking the flow of sap. Since 1876, the following addition to this method has made assurance doubly sure: A fringe made of unthreshed Rye-straw, by tying the cut ends of the stalk together with twine or cord six or eight in a loop, with spaces of about 3 inches between the wisps, is attached to a pole and suspended under the eaves of the penthouse and in front of the trees. The texture being open, it does not prevent the light and air from reaching the buds. These shields are usually placed in position about March 1, and are not removed, except in cloudy weather, until all danger from frost has passed. *Herbert C. Fyfe.*

WEATHER OF THE PHENOLOGICAL YEAR, 1893—94.

The following abstract is taken from a short account of the weather of the natural year, commencing with the autumnal equinox in 1893, and ending with the similar event in 1894, read before the Bradford Naturalists' Society:—

On October 30 and 31, 1893, occurred the first frosts of winter, and on November 6 there was the first appearance of snow that season. On Thursday, November 16, the barometer fell rapidly, and by night a tempest had arisen, which culminated on the 18th and 19th. It was fearfully violent, and caused disasters over a wide area, but on the west coast of France and the east coast of England its destructive power was most felt. The wind came from a northerly quarter, accompanied by biting hail, snow and sleet. The accounts of suffering and shipwrecks published by the newspapers for some days after the storm were very harrowing and painful to read.

The first week of 1894 commenced mild, but by Saturday the cold was more intense than I have recorded before. My thermometer registered 5° above zero, but some observers in the neighbourhood asserted that the temperature had been below zero. All the day on Saturday the severity of the cold was extreme. On Sunday it scarcely abated, but after that it gradually relaxed till Wednesday, when the temperature had so far moderated that a great sense of relief was felt by all.

From the second week in January to the end of the third week in February, the weather was generally of a boisterous character, and though little actual damage was done, at times the wind was frightful. All this time the temperature was above the average, and the Hazels very largely came into bloom; but unfortunately the fourth week of February, if not quite the coldest, was the most winterly week of the season, and, as a consequence, the Hazel flowers

were extensively destroyed, appearing afterwards as if they had passed through a flame of fire. The following week temperature rose again, and sustained a mean above the average till into the last week of April. For nine weeks (the last one ending March 17) the downfall and that mainly rain, was nearly three times the average amount. Notwithstanding, there were many bright days in early March, which suited the flowering Aid-rs [?] and Crocuses. Such a profusion of blossom on these species was extraordinary, and a splendid sight. Rain ceased March 14, and for about a month scarcely any fell; the weather in other respects was superb. Temperature was above the average; there was a liberal amount of sunshine, and not much wind—what there was, was easterly. With these conditions, vegetation became abnormally forward—perhaps a fortnight to three weeks earlier than in 1893, and in 1893 vegetation was a month to five weeks earlier than in 1892.

All through April to the last week there was warm growing weather, and before the end of the month forest trees had begun to enlarge their girths, whilst their tops became green with partially-developed leaves. These latter remarks do not apply to Oak and Ash trees; but the Ash trees at this time were in full flower, and they bloomed more freely than they have done since 1888, though last year (1893) many trees flowered very well, and, indeed, seeded better than they have done this year. The grass grew wonderfully; newspaper reports from all parts were full of promise, and a plentiful hay-harvest seemed to be certain.

The fourth week of May was very cold; during the nights of Sunday and Monday, the 20th and 21st, the temperature fell below freezing many degrees. This cold wave was experienced all over the kingdom, and wrought ruin and destruction in blossoming orchards everywhere. The foliage of many Oaks and Beeches on the sun side was damaged, just as if it had been scorched with fire. A similar frost produced like results on Sunday, May 17, 1891. And it is remarkable the same trees suffered on both occasions.

The week of the frost ending May 26, had a mean temperature of 8° below the average, and the following week it was as low, though the thermometer did not register frost at 4 feet from the ground, and with scarcely any sun; but the next week, or the second in June there was less sun and a flood of rain, when none was needed. The third and fourth weeks of June, were scarcely any better for vegetation, in both there was a lack of sunshine, and temperature remained below the average. It is impossible for me to adequately state the baneful effects of the weather to vegetation since the beginning of May (about eight weeks), just at the most critical time. During the time vegetation had been nearly at a standstill. At the end of April things were five to six weeks earlier than sometimes, but in the fourth week of June they were decidedly backward, forest trees had been about nine weeks in leafing (a longer period than I have known before), and not since the spring of 1888 had there been more flower-buds on Sycamore, Horse Chestnut, Beech, Birch, Alder, Ash, Mountain Ash, Hazels, and Thorns, but never I should think with so fair a promise has there been so poor a fruition, and that the result of those uncongenial weeks. The last week of June and the first of July were splendid with sunshine, there was a dry atmosphere and a high temperature, suiting exactly the hay-makers and favouring the blooming of the Wild Roses. The following five weeks had a temperature above the average, with rather too little sun and more rain than needful—this state of things favoured growth in vegetation generally. Nor was it so wet as to hinder the farmers from gathering in their hay, for by the end of the second week in August the fields were cleared, the crop being a fairly good one and much better than that of last year or year before. Henceforward, to the second week of September, the weather was hardly as favourable as it would have been, had it been equal to average. It was too cold, and there was not sufficient sunshine. The weather of the week ending September 15 was splendid, and to the end of the Phenological Year it was not unsuitable for harvest work.

Briefly, the remarkable meteorological events in the year under review are the storms of November, 1893, the frost of January 6th, and the early spring, the frost of May and the low temperature and meagre amount of sunshine during May, June, July, and August. The sunshine of this time was 412 hours, whilst last year in the same period there were 542 hours.

The cereal crop in quantity is estimated to be over the average, but in quality of grain, it is not equal to that of last year. Peas and Beans have produced scarcely an average crop, whilst Potatos and Turnips, upon the whole, can hardly be reckoned as any better. The fruit crop was greatly damaged by the frosts in May. Harvesting commenced about a fortnight later than last year; it was a little more costly, but by no means could it be called expensive.

The foliage of the trees has not suffered this year, excepting that of those trees which the May frost injured. No wind, hail, caterpillars, insects, honeydew, or anything else has damaged it, and what I regard as a consequence is this, there has been very little second growth, or elongation of twigs and new leaves in late summer. This year the newspapers have said nothing about wasps or acorns; last year they did. This year they have mentioned the Hazel-nuts, but last year there were none worth mentioning.

Of the thirty-five forest trees whose girths I regularly measure, twenty-two trees have increased less than they did in 1893, and nine trees have increased more, whilst four trees have grown alike in both years. Altogether this year the thirty-five trees have increased in girth 328 fractions of an inch ($\frac{1}{16}$), as against 396 last year, that is about as $3\frac{1}{4}$ is to 4. *John Clayton, Bradford, November*, 1894.

NURSERY NOTES.

MESSRS. J. PEED AND SONS' NURSERIES.

Norwood.—At this branch are grown stove and greenhouse plants, Vines, &c. A fine collection of Gloxinias was noted recently in flower, and merit a few remarks. For some years this beautiful class of plants has received special attention at the hands of Messrs. Peed, and, as a result, their strain has become much improved. A few of the newer varieties may be mentioned: William Roupell, white edge, heliotrope ring round centre of flower, with lavender throat, One of the best is Thomas Carlyle, a very free-flowering, dark purple-spotted variety, shading violet to edge; Mrs. John Peed, the most distinct of all, pure white from base of throat up to quarter of an inch of tip, then charmingly encircled with lilac; W. E. Gladstone, good-formed flower, lobes thickly spotted, pinkish-rose, and throat delicately-sprinkled pale rose; Minnie Peed, exquisitely and thickly spotted with purplish-maroon, light spotted edges, good habit, and free. A very striking variety is Queen Victoria, entirely spotted purple, with heavy blotches of same colour; Prince of Wales, a good white, slightly spotted dark brown—very distinct; Princess of Wales, beautifully spotted in French grey; the most charming of all the type is John Peed, immense flowers, crimson-spotted throat, white edge; Jeanne d'Arc, very compact, rather small flower, but of fine form and substance—a good variety.

Of Begonias (single and double), first-rate strains are cultivated. A very fine bank of Caladiums—a great specialty here—presented grand plants in perfect condition. Amongst good new varieties, we noted:—Wm. Marshall, a splendid variety, large rosy-red leaf, golden-green margin, leaf-stalks red; this variety is hardy, and will grow in a frame. Racine, large heart-shaped leaf, standing well up; rose ground, mottled with green, bright carmine-red veins. John Peed, very dark red, transparent, with light-green margin. Linnæus, a good dwarf variety, with light greyish ground, marked with fresh rose veins, and large white spots. Le Caravage is a distinct variety, with a longish leaf, white ground, with greenish border, and beautiful red veins. Madame Rose Laing, very large, a noble variety, leaves long, and all white, also the veins, which are bordered with crimson. Rayon d'Or, very large golden-yellow leaf, very effective, vigorous grower. Very beautiful is Altair, leaf very large, with a deep crimson centre, rose and dark-green spotted border. Anthuriums are represented by some fine specimens in the best varieties; and Crotons—a good collection, plants very finely coloured—deserve notice. A big batch of Cœlogyne cristata is grown into large vigorous clumps. Odontoglossum crispum and the old O. grande—a good stock—were noted with fine plump pseudo-bulbs. A fine batch of Araucaria excelsa in 48 and 32-sized pots also arrested attention.

Grape Vines.—These are grown in all the leading varieties, extra strong fruiting canes being observed. The Vines in pots are placed on hot-water pipes, the advantages accruing from this mode of treatment being, that when a young Vine has been shaken out of the pot and soil, and is placed into its fruiting-pot with a mass of new soil about its roots, the warmth from the pipe warms the soil, and stimulates root-action quickly, and sets moving the otherwise stagnant life of the Vine, and the vigorously-grown pot-vine can be more effectually ripened off, and matured fruit-buds secured for the next year's crop of fruit, and that is emphatically the case with the Muscats, which are sometimes prone to grow on, and the wood to keep green, and therefore immature. Some vineries in full bearing of the following varieties were recently a picture of productiveness:—Madresfield Court, Black Alicante, Gros Maroc, and Muscat of Alexandria.

A newish red-fruited Tomato, named Dunedin Favourite, is grown here; it is a fine cropper, and of good flavour.

A good stock in frames was noted of that charming rock-work plant, Nertera depressa, so pretty when in fruit.

Streatham.

This is considered a poor Apple year,; an inspection, however, of the fine stock here in fruit dispelled that illusion—so far, at any rate, as regards this nursery, and, to write the sober truth about the fruitfulness of the trees might be deemed an exaggeration. Young standard Apples were quite exceptional in their fruiting capabilities; clean, straight stems and good heads. Bush and pyramid Apples on Paradise, and Pears on Quince, were also bearing great crops. The deep crumbly soil evidently meets the requirements of the trees; the situation is somewhat exposed, and the subsoil well drained, the wood is ripened early, and the trees bear early removal better than those which are grown in a sheltered and moist land. Twenty or more acres have just been added to the nursery, showing the demand for this particular stock. To refer to a few amongst the many varieties noted. Apples: on horizontal cordons, small trees of Tower of Glamis (quite distinct from Warner's King, with which it is sometimes confounded), were bearing remarkable crops. This good market variety has been found to be too spreading for a pyramid, but may be grown in any other form. An Apple which is just now in great perfection is one called Gold Medal (Froughton's)—an early and excellent Apple of great fertility. Perhaps the most handsome British Apple in cultivation is Peasgood's Nonsuch. It may be used either for kitchen or dessert. Bush-trees and other forms here were loaded with fruit; it may be grown in any form. That fine new variety, Bismarck, is getting somewhat scarce in the trade, it was fruiting remarkably well here. Fruits were very large and handsome, in the style of Warner's King, but more highly coloured, and striped crimson; the variety has a trick of bearing close home on the old wood. It was very interesting to learn that the Germans (naturally) are eagerly inquiring of Messrs. Peed for Bismarck—well, there is plenty of wood here for grafts. A kitchen Apple, very suitable for cottage gardens, is Pott's Seedling; fruits very large, and abundantly prolific. Cellini, fine for bush or pyramid, and a good bearer, but in gravelly soils it is liable to canker. Baumann's Red Winter Reinette bears freely on the Paradise. Referring to handsome Apples that do well, we may mention Lady Sudeley and Irish Peach, a beautiful and valuable early Apple tree, very hardy and prolific, and equally adapted for a standard, pyramid, or espalier. Other good varieties are Worcester Pearmain, Gascoigne's Scarlet, Gravenstein, Duchess of Oldenburgh, Lord Suffield, and New Hawthornden, all varieties that are getting well known and very generally planted as market fruits.

Pears were bearing large crops, many of the hardier varieties flourishing as standards. There are a good

many Pears which do well on the Quince stock as pyramids, &c., but some of the finer, and especially the later-ripening varieties, require and deserve a good wall. Beurré d'Amanlis, juicy, richly-perfumed fruit, is a vigorous grower, and abundant bearer. It succeeds as a standard, and makes a good pyramid or wall tree, either on Pear or Quince stock. Pitmaston Duchess is vigorous and prolific on the Quince, and may be grown in any form. A new variety of great excellence is Triomphe de Vienne, of rich flavour, a very free bearer, the fruit having to be tied up. Souvenir du Congrès is a handsome early variety, juicy, and melting—trees loaded with fruit; it is not a long-liver on the Quince, doing better on the free stock. Bearing great crops were trees of Knight's Monarch; as this sort sometimes casts its fruit prematurely, it should not be heavily thinned. On Pear or Quince, Clapp's Favourite (an American introduction) is a free-grower and great cropper. The very early Doyenné d'Été (ripening in July), of rich and agreeable flavour, is a moderate grower, and a hardy and abundant bearer; it forms a good standard on the Pear stock. A valuable Pear for market purposes is Fertility; it is a great cropper, very hardy, of brilliant colour (that essential characteristic in a market sort), and of high flavour. On Quince, the well-known rich and highly aromatic-flavoured Williams' Bon Chrétien is a very large and handsome fruit-tree, healthy, a good bearer, vigorous, and upright grower. The buttery and melting Marie Louise—one of the best of autumn sorts, will not succeed on the Quince unless double-worked. The well-known and richly-flavoured Louise Bonne of Jersey, one of the most delicious Pears, was bearing very heavy crops. The tree is a healthy, somewhat erect grower, succeeds well on the Quince, and may be grown in any form, but should not be planted as a standard in very cold localities. Plums Victoria, &c., were bearing very heavily.

Roses.—The Mitcham loam is adapted to the successful cultivation of the Rose, judging by the healthy condition of the stock, and all the finest exhibition, and the so-called garden Roses, were found in great numbers.

Mr. John Peed, sen., has a very high opinion of Royal Sovereign Strawberry, of which the firm holds a good stock. He says it will live as long as those standard varieties, Keen's Seedling and British Queen. A large quantity of John Ruskin for forcing in pots is grown.

A sign of the times is seen in the good collection of hardy herbaceous plants grown, anything good in this way being added to it from time to time. Cactus and Pompon Dahlias are grown very largely, and form one of the sights of the nursery in their season.

THE OSAGE ORANGE.

The Osage Orange (Maclura aurantiaca) is common enough in some of the south-eastern States of America, where it is much used for hedges. In this country, though it is quite hardy, we seldom see it, and still more rarely meet with it in fruit, our summers not usually being hot enough for that purpose. The specimen we now figure, a legacy from the hot summer of 1893, was obligingly sent to us by Mr. Mitten, who obtained it from the garden of the Rev. B. Belcher, of Bodiam Vicarage, Hawkhurst. The

Fig. 88.—Maclura aurantiaca: osage orange. (for details, see p. 694.)

shrub or low tree is near in family kinship to Mulberries, Bread Fruits, Broussonettias, and the Fig. It is dicœcious, spiny, producing globular heads of male flowers on one plant, female heads of similar shape on another. In each case the isolated flower has a perianth of four pieces. These in the female flower ultimately become fleshy, and coalesce into a warted globular fruit. Superficially it is something like an Orange, but the resemblance is as deceptive as that of the Bitter Apple of Sodom. The fruit shown is smaller than American specimens, the ovaries in the absence of male flowers not having been fertilised. The books tell us the fruit has a yellow fetid juice, with which the Indians paint their faces when they go to war. The Sussex specimens are not suited for this purpose, for the juice

is hardly yellow—perhaps it might have become so had maturation been more perfect; and so far from being fetid, the fruits sent have a delicate citrine perfume, something between that of the rind of a Lemon and that of an Orange. The name Orange is, after all, not so very inappropriate.

There is a good figure of the foliage and fruit in the Appendix to the folio edition of *Lambert's Pinus*, t. 12, but, as this is a work not readily accessible to the majority of our readers, we commissioned Mr. W. G. Smith to make a drawing of an interesting plant, which is of much importance in the States, and in some of our colonies. Lambert tells us it was introduced into this country by Lord Bagot, and that it was cultivated in the open air at Boyton in Wilts.

Not only is it useful for hedges, but in favourable localities it attains a height of 60 feet, and becomes serviceable as a timber tree, the wood being very elastic and tough. Baron Sir Ferdinand von Mueller recommends the foliage for feeding silkworms, and tells us (*Select Plants for Industrial Culture, &c.*, p. 230) that the silk thus obtained is in no way inferior to ordinary silk.

The references in fig. 88 are as follows:—A, the head of female flowers, real size; B, the same seen in section; C, the perianth of four pieces, long and slender below, expanding into a peltate disc at the upper part (magn. 2 diams.); D, section showing the position of the ovary with its long style; E, section through an ovary, showing an imperfectly developed ovule and a long style; magn. 4 diameters

Continental Novelties.

A NEW MELON.

A Melon which can be dried when ripe and used as a cooked vegetable, has been imported into Germany by Mr. R. Gaertner, pomologist in Halle, on the Saale. The Melon prospers here (Meran), in the open ground, bearing numerous large fruits. One plant covered 26 square mètres; the largest fruit weighed 15 kilos. It is a species of Water-Melon. The fruit dark green, marbled with light green, that becomes pale yellow when more ripe. The pulp yellowish-white, and the seeds are dark. The fruit when young is hairy, and ripens at the end of September or beginning of October, forming a very nice change to the vegetables in season at that time of the year. A great advantage the variety has over most others, is that the fruit keeps for a long time.
W. Reitling, Seed grower, Meran, Austria.

CHARCOAL BURNING.

The season having arrived when the making of charcoal is usually undertaken, some instructions in the art, simple as it may be taken to be, will not be unacceptable to some of the readers of these pages. Charcoal being one of the constituents of most vine-borders, and of the compost used in cultivating many kinds of plants in pots, the gardener will naturally like to know how it is made, so that when opportunity serves he may be able to do so.

Chrysanthemums are all the better for plenty of charcoal if the soil is heavy, as, whilst lightening the soil mechanically by its presence, it retains moisture that the plant greatly needs. In most country establishments lop and top crooked limbs from trees that are felled or blown down, and trees whose value in carpentry is nothing, such as Poplars and Willows, can all be made into charcoal. It does not matter in what month charcoal-burning is done, provided growth is dormant; and the work of burning often provides men with employment at a season of frost when they would otherwise be out of work. Beech is considered to be one of the best kinds of wood, and Spruce Fir about the worst, the latter is very liable to burn to ashes rather than make charcoal. Practised charcoal burners on commencing dig a hole commensurate with the size of the stack to be built, but this is not necessary; we make ours in the reserve ground, where are stored the manure-heaps, vegetable refuse, and worn-out potting-soil, and by so doing we reduce the labour considerably, as we make use of the materials named in covering the heap whilst burning. For convenience in burning, the wood should be cut into lengths of about 2½ to 3 feet, and should average 4 inches in thickness. If larger pieces than these are used, there is often much waste through the complete burning of the outsides before the central part is turned into charcoal. Where the wood is of a mixed character, it is important to have the pieces of smaller size than if they were all of one kind of wood, as some woods need more charring than others. Proceed to form the base of the heap, which may be 6 feet in diameter, although far larger heaps can just as well be made. I mention this size to convey to those inexperienced in the matter some idea of what amount should be got together when beginning the job. Where the heaps are larger, the stack may be made of that width at the base, but longer than broad; or the circular area may be increased—it is a matter of little account. Whether it is a round heap or a long one, in the centre a small bundle of straw is laid as a beginning, which is covered with small sticks—old Pea-sticks, or the like. This is done for the ignition of the larger pieces of wood, which are stacked on their end round about the straw so as to form a pyramid, building from the centre outwards, and placing the wood so that the flames can pass evenly through the whole heap. The wood may be stacked in one or two layers to a height of 6 feet. It is necessary to leave a hole under the heap by which fire can be communicated to the bundle of straw, and this hole should extend right through the heap. When the stack is formed, cover it over with half-decayed wettish stable-manure or leaves.

In the case of a heap 6 feet high, the manure may be placed round it to a height of 4 feet, and a thickness of 1 foot. The reason for laying it on before the wood is lighted is that owing to the heat of the fire when once well alight, the burners cannot get near enough to place the smothering materials around it quickly enough. The straw is ignited at both sides at the same time through the holes at the base previously mentioned, and in from three to four hours the wood will be sufficiently aglow to require the whole heap to be gradually covered all over with the manure. Where much green wood is used, a longer time should be allowed for thorough ignition before covering the heap, and this kind of wood should not be placed together but distributed amongst that which is drier. In some cases less time than that named will be required, and no exact rule will apply, a good deal depending on the condition and kind of wood used, whether there is much or little wind, the position of the heap, and its dimensions. The outside surface of the manure must be airtight, or the air passing through it will cause the wood to burn into ashes. To render the manure covering still more impervious to the air, some fine soil or sods should be laid over it and be battened down with a spade. Some burners use nothing but soil to cover the heaps, but I prefer manure, as it is not so liable to fall through into the fire, the manure catching on the outside, and not falling inwards. The holes at the bottom should be blocked up last when the heap has got alight on all parts, and it is a useful precaution if a man be appointed to watch the heap for the first night or two, for should any part fall in, the air would cause the total consumption of the stack. If the wood consists entirely of freshly-cut stuff, holes should be pushed through the bank of manure with a long stick, to encourage its charring by the admission of air, allowing it to burn freely for a time, until it is thought the whole is well alight again, as green wood does not burn so evenly and freely as dry wood when finally covered. The holes made in the sides should be covered again as before. When the wood has been cut several months, four days will be long enough to keep the heap smothered, but green wood must have one day longer. When uncovering the heap, commence at the top, and take the partially-charred manure and soil away without allowing them to mix with the charcoal. If there are signs of fire breaking out afresh, water should be used to extinguish it. This is a very essential point, as any delay then would lead to the loss of probably the entire heap. Some charcoal-burners make sure against an accident of this kind by first deluging the heap with water. When cool enough to handle, sort the charcoal into two or three sizes, and secure the finer particles, sifting them from that which is larger, and storing the whole in a dry place under cover. Charcoal is soon spoiled by exposure to the weather. *E. M.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

Miltonia vexillaria.—This plant grows rapidly at the present season, the roots being very active. Enough water should be afforded to keep the sphagnum moss in a growing state. During the past week it has been found necessary to examine each plant, picking out the pieces of sphagnum moss which were not thriving, and carefully pricking into the surface pieces of living sphagnum. These pieces will soon grow, and keep an equable degree of moisture about the roots. This species should, during the winter, be kept at the cooler part of the intermediate-house, where plenty of fresh air can be afforded, the bottom ventilators beneath these plants, except in very severe weather not being entirely closed, always supposing that there is sufficient artificial heat to keep up the warmth to the proper degree. A worthy companion to the above-named Miltonia as regards beauty and form of flower, is the pretty rose-scented M. Roezlii, which is a more delicate species, requiring several degrees more heat at all times to grow it satisfactorily, and a steady temperature like that maintained at the warmer end of the Cattleya-house, where the thermometer does not fall below 58°. When cultivated in the higher warmth of the East Indian-house, the leaves of this plant are liable to be attacked by thrips, which if not soon detected, cause disfigurement of the plants. Under cooler treatment they are not only comparatively free from these insects, but grow more strongly, and flower well. Many plants of this species are now in mid-growth, and should be abundantly supplied with water at the root, especially such as are well established in pots of small size. Where large numbers of M. Roezlii are grown, some will be in flower at the present time, but even these must not be allowed to become too dry. It is now advisable to look over the plants of Dendrobium Wardianum, D. crassinode, D. moniliforme, D. nobile and its varieties; also the garden hybrids, D. Aspasia×, D. Ainsworthii×, D. Wardiano-japonicum×, D. splendidissimum×, D. Dominianum×, and others, including the D. melanodiscus, D. chlorostele, and D. xanthocentrum×, the majority of these plants having prominent flower-buds, and they may be brought from places where they have been resting into a house where the night temperature is about 55°, here to remain till the bloom-buds are fully developed, when removal to the East Indian-house, choosing the lightest position available, will be a suitable change. Water at the root must be very carefully applied, at comparatively long intervals of time, any undue excitement at this period frequently causing the growths that are now visible at the base of the pseudobulbs to break away, and preventing the flower-buds from coming to perfection. When the plants are placed in the East Indian-house, a slight syringing overhead with soft tepid water on sunny days, if judiciously afforded, will tend to the freer expansion of the flowers. There are some few species of Dendrobium which are sometimes late in finishing their growths, and these plants should be kept in a stove-warmth, and liberally watered till growth is fully made up. Among the small-flowered Oncidiums, O. cheirophorum is a general favourite, and the plants are now opening their pretty yellow-coloured flowers. The plants should be hung up to the roof of the intermediate-house, and when the flowers begin to open, less water will be required. They will last in good order for several weeks if not injured by damp. A charming plant when in bloom is Angræcum pellucidum, now showing its flower-spikes, which should be constantly directed in the way they should go, or they will descend into the compost, and probably be lost. It is important at this season that more heat be afforded in the houses; and that Cypripediums

Schizlias, Epidendrums, Bolleas, and others, which are growing freely, do not suffer for lack of water at the root, and to make sure, they should be examined almost every day, and if found to be dry in the least degree, a thorough soaking must be afforded them; especially is this applicable to Cypripediums, which are plants that do not like dryness at the root at any season. Plants on blocks or rafts should on no account be neglected as regards watering.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

VINES.—Plants started during November will require a gradual increase of the warmth, and it may range from 55° to 60° by night, 65° to 70° by day, with air afforded freely at the top of the vinery on sunny days, the house being closed early in the afternoon with plenty of moisture about. The Vines should be daily syringed till they come into leaf. Canes which were loosened from their trellis and lowered to induce an even break, should be fastened up as soon as the buds have become equally prominent at the top and bottom. At this time a selection should be made of those buds which come in the best positions on the canes, and are showing the best bunches. There should be no steaming beds of hot manure inside the house after the Vines are well started, the resulting ammonia being apt to cause injury to the leaves at this early stage.

EARLY POT-VINES started about the beginning of last month, which may be growing freely, should have an increase of warmth night and day, with air afforded on fine days, a moist growing atmosphere being maintained, but not by syringing, which should be discontinued as soon as the Vines are well into leaf. Select the bearing shoots as soon as possible, stop them at the third leaf above the bunch, and gradually bring them to the right position on the trellis. The soil should be afforded free supplies of tepid water when water is needed. If the soil be allowed to become unduly dry after starting, the bunches will be checked, and perhaps stunted in development.

SUCCESSION VINERIES may now be prepared for starting by pruning, and cleaning the canes, washing the wood-work, glass, walls, and floors, and removing the upper crust of the borders to the depth of a few inches, and replacing it with new loam, some bone-meal, or special Vine-manure being added. Vines which were infested with red-spider, mealy-bug, or other insects, should have the canes thoroughly brushed with soap-suds, and then be painted with the composition previously recommended for early Vines. The inside borders should receive a thorough soaking with tepid water.

YOUNG VINES IN POTS intended for fruiting-canes in 1896 should be cut back; if intended for early forcing, they should be potted into their fruiting pots at once, ready for starting into growth early in the year; 12 or 14-inch pots are the most suitable sizes. The pots should be quite clean, or new, and well drained with crocks, oyster-shells, and half-inch bones; for a potting-soil, make use of turfy-loam, rather adhesive than light, which has been stacked for one year, mixing with it a rather large quantity of bone-meal and half-inch bones. This soil, when used, should be neither too dry or too wet, as it will require to be made very firm with a potting-stick, and a wet soil would be spoiled under that method. The pots must not be filled within 2 inches of the top.

VINE-CUTTINGS required for striking in the spring should be taken off, labelled, and laid in damp soil till required.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

HORSERADISH.—This should be lifted whilst the soil is unfrozen, and stored in moist soil for use. If this method be not practised, still it is advisable to lift a sufficient number to supply the needs of the family during the winter months, as it will keep quite fresh and good for a long time if stored in moist soil or sand in a place protected from frost. A sufficient number of small roots with crowns can generally be found from which to make a fresh planting.

CAULIFLOWER PLANTS.—These will need as much air as possible, or drawing will occur. During very severe weather the hand-lights or frames should be kept close, except when the sun shines for a few hours in the middle of the day. It is prudent to throw a little light dry litter or Fern protection over the glass on very frosty nights; occasionally the dead leaves should be removed, and the soil stirred, and if mouldiness be present, a dusting of dry wood-ashes will be beneficial. Cauliflowers which are stored in pots may be sunk in sifted coal-ashes up to the rims, so as to protect the roots from frost, and prevent the loss of moisture from the soil.

BROCCOLI.—The season has come when Broccoli with heads already formed may be lifted with what soil hangs to the roots, and placed thickly together in a cool shed, or similar place, that affords a certain amount of protection against frost, and is light. Those which are but just forming heads may be planted in deep frames or any cool glass structure from which frost can be excluded. As these latter will need root-nutriment, to enable them to form good heads, a good quantity of soil should be placed around and pressed against the balls to fulfil the object in view, and if it is moist little or no water will be needed.

POTATOS IN DUNG FRAMES.—The first planting may be made in beds made up of sweetened stable manure about 3 feet thick. The soil with which the beds are covered should be of a light rich sandy nature, and not less than 6 inches in depth, being brought up to within 1 foot of the glass. When planting, place the sets, previously sprouted, in shallow drills, adding more soil to the bed as the shoots protrude, so as to obtain as much from the bed as possible. The breakfast Radishes, red and parti-coloured, may be dibbled in lines between the rows of Potatos when moulding up is finished. Dung linings will be required by both pits and frames, to maintain a temperature of not less than 60°, and coverings must be employed at night.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

THE TREATMENT OF THE CALADIUM.—The tubers which were ripened early in the autumn may now be started into growth. Although it may seem early for doing so, it is in many respects an advantage, for in the case of weak-constitutioned varieties it affords a longer season of growth, and a greater amount of time with sun-heat in which to ripen the tubers. The best time for Caladiums to finish up is during August and September. Where the stock is large enough to allow of dividing it, there may be three different succession batches made, starting one at the present time, another at about the end of the month, and the last towards the end of the month of January. Caladium argyrites and C. minus erubescens should be the first dealt with, these varieties taking a little longer time to establish themselves. Bearing in mind that the tubers may be increased by division, a stock of plants can soon be obtained, as each little crown, if severed with a sharp pen-knife, will in due course form a plant. When a tuber has been cut up, or a piece taken off, it should have the bare surface rubbed with charcoal-powder, so that the escape of sap may be prevented. If the stock plants are young ones, and it is intended to increase the number, the crowns being small, three sizes of pots should be used, the smallest crowns going into small thumbs, and the larger crowns in pots slightly larger. Finely-sifted peat two parts, one part of silver-sand, and one part leaf-soil, or cocoa-nut fibre refuse, may be used as a potting soil at this stage. After potting, and watering with tepid water, plunge them in a propagating-case or hot-bed frame, in a bottom-heat of 90° to 95°, afterwards applying water very sparingly until the first leaf shows colour on a plant, when the amount may be gradually increased.

TEMPERATURE.—With the fall in the external temperature, a corresponding fall must take place in the house, or the results may prove disastrous, plant-life in general being in a more or less inactive state at this period. It is observable after a severe winter that when the growth of plants has been retarded by lowered temperatures, the plants are usually in much better condition in the summer following than is the case after a mild winter. This, however, will not apply to plants which are forced at this season, most of these being matured in a warmer climate than ours, and being treated by us as of annual duration, they may be pushed on into flower without much regard being had to future growth. The mixed plant-stove should now be kept at 60° to 65° at night, with a maximum of 70° by day. The Crotons should have a similar heat, while Ixoras and Eucharis grandiflora may be treated to 5° less. The greenhouse should be kept from 40° to 45° at night, in accordance with the outside temperature, admitting air by day whenever prudent to do so. The conservatory, containing, as it may do, plants requiring a little warmth, may be kept at 50° to 55° by night, with 5° more by day. The warm Fern-house should have like conditions as regards warmth, and in the cool fernery very little heat will be required. Ericas and Epacris should be merely protected from frost.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

HERBACEOUS PÆONIES.—These are fast coming into favour, and justly so, being so easy of cultivation, and the flowers very effective, either on the plant or when cut. If they are removed from the plant as soon as they expand, or even before, they last a long time in water, and the foliage is very ornamental. The plants are decidedly ornamental, even after the flowering season is past, and act as capital foils to other kinds of plants. In regard to soil, Pæonies are not fastidious, doing well in almost any kind of garden soil, providing it is fairly good, and not shallow. If planted in large masses the land should be well-manured and trenched; but when occupying stations only in the herbaceous perennial border, holes in accordance with the size of the masses of tubers should be thrown out and filled with partially-decayed turf and rich manure, in which mixture they will thrive for several years with occasional dressings. Pæonies are improved by being transplanted once in six years or thereabouts. Little or no protection is required by them through the winter in the south, but in cold districts of the country and exposed positions it may be needful to afford them some slight protection such as is afforded by a heap of leaf-mould, cocoa-nut refuse fibre, or spent Mushroom-bed manure placed over the crowns. Many new varieties can now be obtained at the nurseries, and some of these are undoubted improvements on the old varieties. A succession of flowers may be had for about two months by having a good selection of varieties; these bloom in May and June, when other flowers are not abundant in the borders. The singles are, perhaps, the best for filling vases, having less heavy heads of bloom, and therefore carrying themselves more erect. Some of these, as well as the doubles, are fragrant. For colour we have from white in almost every shade down to velvety-crimson. Among the doubles, Abotis, flesh colour; Auguste Miellez, blush-white; Agnes Mary Kelway, delicate rose (a new variety); Constance, fragrant, creamy-white centre, outside of petals purple; Comte de Paris, delicate pink; Charles Verdier, deep purple, inside pale rose; Emile Lemoine, white, streaked with carmine; General Cavaignac, a large flower, scented, the colour purplish-rose; Globosa, rose-pink; Gloire de Douai, deep crimson; Hortense, rose-pink; imbricata plena, lilac; Labolas, pink, centre tipped yellow; Lady Carrington, one of recent introduction, a lovely flower, white, flushed with pale rose; Lady Dartmouth, white; Leonie, flesh; Lucrise, peach and white; Macilla, pink and yellow, scented; nivalis, yellow and white; Pottsii superba, purple-crimson; and purpurea superba, purple. Excellent single-flowered varieties are Trophy, purple; Pantheon, salmon; Orobis, primrose; Endymion, sulphur; Laconi, salmon; Fundanus, red; Bacchus, crimson; Quintilius, white; Rabelais, pink; and many more.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

LIFTING AND RE-PLANTING WALL TREES.—All young trees which are planted on walls should be re-planted the second winter after receiving them from the nursery. This plan, besides inducing early fruit bearing, prevents the formation of strong tap-roots. The neglect of this measure, besides making the subsequent transplanting of the trees a difficult operation, also encourages a strong and sappy growth, which is bad to ripen in the majority of years. If the garden has long been under cultivation, the lifting and re-planting of the trees keeps the roots in the prepared soil of the fruit border for a long period, and conduces to the future well-being of the trees. No opportunity should now be missed to get such work carried out whilst the weather is open, as the season, being far advanced, frost may set in at any time, and put a stop to the work for some long time. In re-planting the trees, one or two wheel-barrow loads of old Melon-bed mould or other turfy loam mixed with charred garden refuse and placed about the roots will encourage healthy growth in the trees.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	DEC. 11	Royal Horticultural Society: All Committees, at the Drill Hall, James Street, Westminster. Horticultural Club.
WEDNESDAY,	DEC. 12	East Anglian Horticultural Club, Norwich.
THURSDAY,	DEC. 13	National Rose Society, at Hotel Windsor, Victoria Street.

SHOW.

MONDAY,	DEC. 10	Smithfield Club Show, after 2 P.M.
TUESDAY, to FRIDAY,	DEC. 11 to DEC. 14	Smithfield Club Show, from 9 A.M. to 9 P.M.

SALES.

MONDAY,	DEC. 10	Final Clearance Sale of Nursery Stock at the Windlesham Nurseries, Bagshot, by order of the Executors of Mr. R. Mason, deceased, by Protheroe & Morris (two days). Dutch Bulbs at Protheroe & Morris' Rooms. Special Sale of Hardy Perennials, Carnations, Lilies, Iris, &c., at Protheroe & Morris' Rooms. Sale of Leasehold Nursery at Sutton-at-Hone, by Dartford, Kent, at the Mart, London, by Protheroe & Morris.
TUESDAY,	DEC. 11	Dutch Bulbs at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 12	Sale of Fruit Trees, Euonymus, &c., at Chas. Lee & Sons' Nurseries, Ealing Dean, by Protheroe & Morris (two days). Sale of Established Orchids at the Town Hall, Streatham, S.W., by Protheroe & Morris.
THURSDAY,	DEC. 13	Dutch Bulbs at Protheroe & Morris' Rooms. 279 Cases of Japanese Lilies, Roses, Spiræas, &c., at Protheroe & Morris' Room.
FRIDAY,	DEC. 14	Established and Imported Orchids at Protheroe & Morris.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°.8.

The Lindley Library.

IN view of the steps now being taken to increase the utility of the Lindley Library, and as a beginning, to issue a printed catalogue of its contents, we lay before our readers some suggestions of Mr. W. ROBERTS, in the hope that they may fructify and help on the movement. Many of our readers will remember that on the occasion of the Potato Exhibition at the Aquarium some years ago, the collection of books got together formed a most interesting and valuable part of the programme. Some also will recall a great International Exhibition at Amsterdam, where the exhibit of Mr. KRELAGE'S magnificent collection of horticultural books excited the greatest interest.

"It may be asked, can the movement to develop the Lindley Library receive an impetus which shall at once draw public attention to it, and ensure its ultimate success? It seems to me that the answer is not a difficult one. A conference on, and an exhibition of, books dealing with horticulture and nearly allied subjects would, I am convinced, be extremely popular, and equally interesting. It is scarcely necessary to point out at the start that such an exhibition would have to be first-class and comprehensive to be at all successful. I should like to emphasise this, as I feel confident that if such an exhibition and such a conference were done in a half-hearted manner, it would not have the desired and far-reaching results which I venture to anticipate from the more comprehensive scheme. The idea suggests two alternatives.

The more ambitious plan of the proposed scheme might be based upon the various and successful exhibitions of the Arts and Crafts Society, and the New Gallery in Regent Street might be rented for a brief period as the centre of operations. It is the most central and the most convenient place of its kind in London. It may be urged that the interest of a horticultural and floricultural exhibition would be much more circumscribed than that of the Arts and Crafts. I do not admit of any such objection; on the contrary, it could be made of a much more general interest, without sacrificing its importance to the specialist. Here, for example, are a few of the branches or divisions into which one section alone of the exhibits might be classified:—

Pictures in oils of floral subjects: (*a*) ancient; (*b*) modern.
Water-colour drawings.
Sketches in black and white.
Early *Herbals* with illustrations.

The five foregoing sections would of themselves constitute a very interesting exhibition, for we have all ages and all countries to draw upon. The old masters of floral design constitute a very wide and a very interesting field, and a few examples of the best French and Dutch schools, Jan Van Huysum, Synders, Rubens, Jan David de Heem, Jan Wieninx, among the latter, and Jean Baptiste, Belin de Fontenay, Chardin, Desportes, Monnoyer, among the former. The second, third, and fourth sections might be extremely interesting and representative, including, as it ought, examples of book and other floral illustrations, not only by British, or even European artists generally, but also of work by Chinese, Japanese, Persian, and other draughtsmen. This section should also include books illustrating the rise, progress, and present condition of illustrated books, from Curtis's to Hooker's *Botanical Magazine*, Maund's *Botanic Garden*, and the *Floricultural Cabinet* of the past, with Sowerby's *English Botany*, and a legion of other books with coloured illustrations of the present day. The early English and other herbals would include many illustrated works of the highest curiosity and interest. Of Gerarde's *Herbal* for example, how many have heard, and how few have actually seen? This book is, to those interested in the gardening literature of this country, quite as important a volume as the First Folio Shakespeare is to the student of English history—it is a volume of perennial interest, the essential corner-stone of any horticultural library.

The exhibition of ancient and modern gardening and horticultural books might be made extremely interesting, illustrating, as it would, the evolution of practical gardening and scientific horticulture from the crude and legendary theories of the ancient "natural history" writers to its present high state of perfection. Such a wide and varied section does not very readily lend itself to classification, and a division according to the successive centuries would be arbitrary, and consequently both anomalous and confusing. The *incunabula*, or books printed before the commencement of the sixteenth century, might very well stand alone. A rough classification of the remainder may be suggested as follows:—

Early (16th century) books dealing with the subject generally.
Early books dealing with trees.
The first books dealing with garden botany, 1, English; 2, French; 3, German; 4, Dutch.
Early books dealing with landscape gardening.
Early books dealing with vegetable gardening.
Early books dealing with flower gardening.
The first or early gardening periodicals.
Early books dealing with Kew and other Botanic Gardens.
Early books written by botanical explorers (English and foreign).
Gardening dictionaries.
Transactions of the early societies, with treatises on plants, &c.
Portraits of past celebrities (Gerarde, Tradescant, Miller, Knight, Herbert, Lindley, &c.).
Early seed and plant catalogues.

Those who know anything of the bibliography of gardening, need not be told that the book exhibition alone might not only be extremely extensive, but that it would be of remarkable interest. The old gardening books are not perhaps as easy to read, or as quickly digested as a modern novel, but each one is nevertheless a more or less important contribution to the history of gardening, which is still waiting a competent chronicler. In this age, the tendency to ignore the past is much too keen and too general, and it is not often enough remembered that the successes of to-day are the result of the failures or partial successes of yesterday. It is well to—

"Look unto the rock whence ye are hewn,
And to the hole of the pit whence ye are digged."

A third feature of the purposed exhibition would partake of the nature of a *hortus siccus*. To my mind, nothing can be more interesting or more instructive than the development of a large number of garden flowers and vegetables, and such an exhibition would permit of this being carried out in a very successful degree. Specimens, for example, of the common Potato, of the typical species of Begonias, Asters, Chrysanthemums, and a thousand and one flowers and vegetables which are now only generally known by their garden varieties, would prove, as has been said, highly instructive. They might not reconcile one altogether to the soapy Potato tubers, stale Cabbages, or stringy Turnips, which our greengrocer assures us are the best in the market, but they would suggest many object-lessons.

The Conference, which inevitably suggests itself in connection with such an exhibition would, of course, consist of papers on various phases of what may be termed the intellectual history of gardening; and a properly drawn-up report would form as invaluable a book of reference as that, for example, on the Conifers. There is no lack of material for such papers—rather, indeed, an overplus.

It may be asked, where are all the pictures, books, and so forth, to come from? A glance through the list of Fellows of the Royal Horticultural Society leads one to the conclusion that a very large number of items could be borrowed from the members—more than sufficient with which to make a good start, and other sources could be drawn upon afterwards.

The comprehensiveness of the foregoing scheme, doubtless, at once prevents its official adoption by the Royal Horticultural Society, but a strong committee could be formed out of the Society. Unfortunately, the Royal Horticultural Society is afflicted with the *res angusta domi*, when it comes to anything or exhibition of a relaxing nature. Other societies take their dissipations in the shape of fashionable evening conversaziones and semi-private exhibitions, but the severely practical Royal Horticultural Society only relaxes to the extent of one brass band annually. I doubt whether there is any other first rate society in London which does so much useful work as the Royal Horticultural Society does, but that usefulness might be extended in many directions.

Failing the foregoing scheme, which, as a society, the Royal Horticultural Society may not be disposed to take up, I venture to submit a much less elaborate proposal, which they might with great profit act upon. And that is to hold, instead of one of the fortnightly shows, an Exhibition of Gardening Books—at the Drill Hall, if no better place can be secured. This might be made fairly comprehensive and certainly very attractive, at a very small outlay; and if the exhibition were properly advertised and paragraphed, it would undoubtedly be a success. The publishers who make a specialty of gardening books would, I have no doubt, give such a scheme practical help, and the catalogue of the loan exhibition might be so arranged as to include the whole of the books in the Lindley Library, thus serving a double purpose. I believe that the library itself would receive many gifts of rare or noteworthy books by such publicity. Nobody outside knows what the Lindley Library contains, and they do not care about the bother of enquiring. If they knew positively, the Library would receive many additions. A combined and strong effort would place at the disposal of the Society a very substantial sum for the production of a first rate catalogue. *W. Roberts.*

Musa Ensete, Rose Hill, Falmouth.

Musa ensete at Rose Hill, Falmouth (See Supplementary Illustration).—This fine plant of Musa ensete, the Abyssinian Banana, is growing in Mr. Howard Fox's garden at Rosehill, Falmouth. The original seed of this plant was kindly sent to Mr. Fox by Mr. Nock of the Hakgalla Gardens, Ceylon; it was sown in the latter end of February, 1892, and had bottom-heat. The young plant was put out early in June of that year, and was from 4 to 5 feet high when frost cut it down in the winter. A fresh shoot came up in June, 1893, and the entire plant was taken up, put into a box the following November, and kept under glass for the winter, during which time it continued to develop fresh leaves. It was taken out of the glasshouse in May to harden, was planted where it is shown in the picture on June 4 last, and is now about 10 feet high, and 2 feet in diameter where it leaves the ground. Some of the leaves are nearly 6 feet long, and 3 feet broad. They are delicately fringed with red, and the midribs are very conspicuous from their beautifully graduated shades of carmine. They are channelled, so as to carry the condensed dew or rain into the deep channel on the upper side of the midrib, which is thus conveyed to the reservoir at the base of each leaf, where it clasps the stem. Another plant in the same garden has developed from a seed planted last February, was put out on June 4, and is now 5 feet high, with leaves 4 feet by 2 feet.

Royal Horticultural Society.—The last meeting this year of the above Society will take place next Tuesday, the 11th, in the Drill Hall, James Street, Victoria Street, Westminster, when the Fruit, Floral and Orchid Committees will meet as usual at 12 o'clock.

The Rev. W. Wilks.—We are requested to publish the following letter:—"I have received so many marks of sympathy and kindness from so many of the Fellows of the Royal Horticultural Society during my long and trying illness, that I am loth to ask them (if you will allow me to do so through your columns) to grant me still one more indulgence, necessitated by my past illness. I am not without hope that the ordinary work of the Society (thanks in great measure to the diligence of the Assistant-Secretary), has not suffered much from my compulsory absence at times, but unfortunately the one department which I keep more especially in my own hands, the *Journal* of the Society, has fallen somewhat in arrear, whilst, at the same time the amount of 'matter' for it is unusually heavy—so much so, that I find it quite impossible to publish the whole of it at Christmas. I have, therefore, obtained the consent of the Council to publish the Report of the Hardy Tree Conference, and the Crystal Palace Fruit Conference Reports at Christmas, and to defer the ordinary volume of the *Journal* till March, 1895. I venture, therefore, to ask this further kindness of my horticultural friends, viz., that they will endorse the consent of the Council and will grant me the further ten or twelve weeks for the editing of the remaining portion of Volume XVII. of the *Journal*. The Report of the two Conferences is in the printer's hands, and will be issued as Volume XVIII. at Christmas, or early in the New Year, without fail. W. Wilks, *Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W., Nov. 22, 1894.*

National Rose Society.—The secretaries desire us to make known to our readers that the annual general meeting will be held at the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Thursday, December 13 (instead of on Thursday, December 6 as previously announced), at 3 o'clock. The annual dinner is also unavoidably postponed to Thursday, December 13, at 6 o'clock.

Horticultural Club.—The usual monthly dinner and *conversazione* will take place on Tuesday, December 11, at 6 P.M. The subject for discussion will be "Roses and their Odour," to be opened by Mr. D. T. Fish.

"The Book of the Rose."—The Rev. A. Foster Melliar has issued, through Messrs. Macmillan & Co., a new treatise on the history, cultivation, and varieties of the Rose. As the work of a sound and experienced practitioner, this will be received with acclamation. We shall take an early opportunity of alluding in greater detail to this new tribute to the queen of flowers.

Copper Sulphate and Potatos.—We have received the following letter from Messrs. David Brown & Son, Limited, Donaghmore, Tyrone, dated October 24, on this subject:—As will be seen, the dressing with copper has been a wonderful success this season. The crop continued green and growing until cut down by frost ten days ago, while the untreated plot was destroyed by the blight early in August. As a result, this part is covered with weeds, while the dressed part is as clean as Turnip ground. We need scarcely say that the quality of the Potato is greatly improved by being so fully matured. The "Antrims," from the dressed part, are beautifully dry and floury. We also annex the results of this treatment in previous years, which shows that the dressing with copper-sulphate may now be said to be an established success. In seasons like 1891 and 1892 when September was wet and cold, the gain is, of course, below that of 1893 and 1894, when that month was warm and dry. Even in unfavourable seasons an expenditure of 10*s.* per acre for materials and labour produces 2 tons more of Potatos, and greatly improves the quality of the entire crop.

1891, gain per statue acre	...	...	38 cwt.
1892 ,, ,,	...	...	41 ,,
1893 ,, ,,	...	...	70 ,,
1894 ,, ,,	...	...	95 ,,

Produce per Statute Acre, 1894.

The Potatos got one good dressing during the last week of July (before the blight attacked them) with the "Eclair" Sprayer.

Ayrshire Gardeners' Mutual Improvement Association.—The fortnightly meeting of this association was held in the Carrick Street Hall, Ayr, on Thursday evening, November 29. Mr. McCallum, Vice-President, occupied the chair. Mr. Jas. Murray, F.R.H.S., Glasgow, read an excellent paper, entitled "The Chemistry and Diseases of the Tomato," for which he was accorded a vote of thanks.

Some Destructive Potato Diseases.—These form the subject of a short *Bulletin*, issued by the United States Department of Agriculture, and compiled by Mr. B. T. Galloway, the chief of the division of Vegetable Pathology. Mr. Galloway describes three diseases only:—1, the Potato Blight, due to the attacks of Phytopthora infestans; 2, Macrosporium, which affects the leaves, and is often confounded with the preceding, though it does not affect the tuber; 3, Potato scab. For the first two, spraying with Bordeaux Mixture when the plants are 6 to 8 inches high, is recommended, the process to be repeated every fourteen days, till five or six applications have been made, the object being to keep the plant at all times covered with the fungicide. For scab the tubers are immersed in a solution of corrosive sublimate 1 oz. to a gall. of hot water, and diluted eventually to 14 gall. of water, for an hour or two then spread out to dry, cut and planted in the usual manner. The extremely poisonous character of these solutions, especially of the corrosive sublimate, must always be borne in mind. "The three diseases cause a loss of several millions of dollars annually. The treatment is preventative, not curative. The importance of beginning early cannot be too strongly urged. It may be considered unadvisable to go to the trouble and expense of using the spray when perhaps the disease may not occur at all. To this it is answered that there is scarcely a section of the country where one or other of the diseases mentioned does not occur every year. Furthermore, it is a fact well established by experiments, that even if no diseases whatever appear, spraying with the Bordeaux Mixture will increase the yield to such an extent as to make the work profitable."

"Proceedings and Journal of the Agricultural and Horticultural Society of India."—From the latest issue of this publication—April to June, 1894—we abridge the following items:—Some seeds of Polygonum sachalinense were successfully germinated in the Society's gardens at Calcutta, "though European seedsmen and agriculturists deny that this variety of Polygonum produces seed that will germinate." The "double Cocoa-nut" (Lodoicea seychellarum) has at last completed the process of germination. On August 10, a slight upheaval of the soil was noticed; a month later a shoot appeared, and this is now 6 inches long, and expected to grow considerably before the first leaf is developed. On the whole, the report is of a successful year's work, and chronicles progress.

The Destruction of the Grubs of the Cockchafer by means of a Fungus.—According to a note by Professor von Paul Sorauer, in the German *Handelsblatt für Gartenbau* for the last month, experiments have been made by him in inoculating grubs of the cockchafer at different stages of development with the fungus mould—Botrytis tenella. This fungus material was raised in bread culture, and was provided by Dr. Eckstein (Eberswalde), in sufficient abundance for the experiment. The experiment was carried out in a close case nearly filled with earth, and divided into four divisions, in which the grubs which were taken from the soil of a nursery were laid at various depths. These grubs were of various sizes and ages, and in the case of those which were inoculated, they were rolled in a broth made with water and spores. When the task of laying-in was finished, the soil was planted with Lettuces. Two of the divisions were maintained in a moist condition, one with inoculated, the other with uninoculated grubs; and the two other divisions were kept in a dry state, the grubs being inoculated and uninoculated as before. The result of the experiment seemed to prove that in a dry soil the inoculation with Botrytis spores was without effect, whereas in the wet soil inoculation favours their destruction. Still, the circumstance that half of the total number of dead bodies which had been dipped in the spore-broth were found without a trace of Botrytis mycelium upon them, seemed to prove that the constantly wet condition in which the soil in two of the divisions was kept was fatal to the grubs by causing other diseases. The deeper-going roots of the stronger of the Lettuce plants were gnawed by the grubs, but apparently not before the smaller grubs had been devoured by their stronger companions.

Anemone japonica Whirlwind.—We are requested to publish the following: "On p. 661 of your issue of the 1st inst., we see you publish a notice of an Anemone japonica Whirlwind. Permit us to call your attention to the fact that this was introduced by us to the English trade last year, on behalf of the raisers, Messrs. James Vick's Sons, Rochester, New York, U.S.A., and we are very pleased to find that it has given such great satisfaction. *Cooper, Taber & Co., Ltd.*"

Government Agri-Horticultural Gardens, Lahore.—We have received a copy of the Annual Report, ending March 31, 1894. The maintenance of the botanical part of the garden (which is entirely under control of the Professor of Botany) amounted to Rs. 536-3-6; 2894 plants of various kinds were issued in exchange for plants with other gardens and private individuals, and as free issues to the gardens of charitable institutions. 1174 packets of seeds of various kinds were also issued free of charge, chiefly to the Royal Botanical

Gardens, Calcutta, and the Botanical Garden, Lahore. For some years past a good deal of quiet work in the direction of agricultural experiment and the selection of seed has been going on in the Agri-Horticultural Gardens. The results have already been of considerable value, and seed of superior varieties of cereals has been distributed to many districts. At present perhaps Palestine Wheat and Egyptian Cotton promise most. Chocolate Barley is a good variety, but its colour appears to raise prejudice. Canadian and Danish Barleys have done well. Canadian Wheat has been a failure. These agricultural experiments are conducted under great difficulties. The soil is bad, and the area very cramped. Mr. Hein, the superintendent, receives the thanks of the Government for his successful management.

The Surveyors' Institution.—The next ordinary general meeting will be held on Monday, December 10, when a paper will be read by Mr. William Sturge (Past-President), entitled "The Burdens on Real Property and Land," and a discussion will take place on th at paper, and on the paper read at the last meeting by Mr. A. Dudley Clarke (Fellow), entitled "The Incidence of Taxation on Land." The chair to be taken at 8 o'clock.

The Nervous System of Plants.—Professor Green has been discoursing on this subject before the Pharmaceutical Society, and had little difficulty in foreshadowing the more highly organised nerves of animals in the lowly structure of plants, that is, in the protoplasm. Even some power of vision may be accorded to plants, which are sensitive to the impressions produced by light, and bend towards the direction whence the light comes. Sensitiveness to touch is exemplified by the sensitive plant.

The Green Daffodil.—Mr. G. Renthe, writing in the *Gardeners' Magazine*, says that this species, N. viridiflorus, is now in flower at the Hale Farm Nurseries, Tottenham (Messrs. T. Ware & Son). The plant is said to be destitute of leaves, the scape fulfilling the function of leaves. It is figured in the *Bot. Mag.*, t. 1687, and was reintroduced by Mr. G. Maw from the neighbourhood of Gibraltar (see *Gardeners' Chronicle*, 1885). Mr. Burbidge, *The Narcissus* (1875), pp. 57 and 85, describes the plant as having one or two slender terete leaves produced at the same time as the flower, and these are figured in his plate, t. 441.

A Branch of the Gardeners' Royal Benevolent Institution.—It is the intention of the Wolverhampton Gardeners' Association and Chrysanthemum Society to establish a branch of the Royal Benevolent Institution, to be called the Wolverhampton and Staffordshire Auxiliary, and a meeting has been arranged by the committee for December 14, 1894, at 7.30 p.m., at which the Mayor of Wolverhampton, C. T. Mander, Esq., will preside, supported by other influential gentlemen; H. J. Veitch, Esq., and G. J. Ingram, Esq., addressing the meeting on the objects of its promoters. They are very desirous that the leading gardeners of the district should make an effort to attend the meeting, and afford their support to Mr. Veitch and Mr. Ingram. The committee expresses the wish that prominent gardeners should become members of the committee or stewards of the auxiliary, and that those who may not be able to attend the meeting would intimate their willingness to accept a stewardship. The circular convening the meeting is signed by G. A. Bishop, Chairman; and J. H. Wheeler, Secretary, Glen Bank, Tettenhall. Tickets for the repast, given at 6 p.m., price 1*s*. A similar branch has been established at Birmingham.

Birmingham Gardeners' Mutual Improvement Association.—At the usual meeting of this society, held on Nov. 19, presided over by Mr. W. B. Latham, a paper on the "Culture of the Dendrobium," was read by Mr. John Cypher, of the firm of Messrs. Cypher & Son, Cheltenham, before a fair attendance of the members, including several well-known experts. This lecture, in great part, will be found on p. 690. Mr. Cypher exhibited several finely-grown young plants of Dendrobiums in small pans, also an assortment of finely-developed racemes, rich in colour and substance, and conspicuous amongst which was D. Phalænopsis Schroderianum. The collection was supplemented by a few cut specimens, supplied by Mr. H. A. Burberry, from Mr. Joseph Chamberlain's collection at Highbury—some of which also possessed rare merit. In the interesting discussion which followed the delivery of the paper, several important questions were put and kindly answered by Mr. Cypher, notably as to the question of pruning the pseudobulbs—a proceeding he advised to be cautiously adopted—though very signal successes had been obtained by experts in the exercise of the process. Similar advice was also rendered regarding the application of liquid manure directly at the roots. A safer course being its application atmospherically. Eminently satisfactory results, however, had been obtained from the former method, notably the grand specimens of Phalænopsis, described and figured in the *Gardeners' Chronicle*, April 28, 1888, in the possession of Mr. Fred Scholes, of Brooklyn, New York, and whose late grower (Mr. F. A. Gardiner) freely applied liquid cow-manure to the roots when in an active state of growth, as they ramified in the sphagnum-filled baskets. Amongst other exhibits a few finely-developed cut blooms from late cut-back Chrysanthemums, were shown by Mr. Higby, of Edgbaston, and Mr. C. Bick, gr. to Mr. Walter Chamberlain, Harbour Hall, branches of several shrubs in flower, illustrative of the mildness of the season. At the close of the proceedings, a hearty vote of thanks, proposed by Mr. Walter Jones, and seconded by Mr. Burberry, to Mr. Cypher for his instructive lecture.

Oodeypore.—We have received the annual report of the gardens of His Highness the Maharana of Oodeypore, for the year 1893—94. These gardens are under the able superintendence of Mr. T. H. Storey. Great injury was done by a hail storm in May; indeed, the season is described as the most abnormal on record. The top-shoots of the Mangos were broken off and the fruit lost. When the flowering season came round, the new buds proved to be growth-buds, to replace the shoots that were destroyed. The rainfall subsequent to this storm amounted to 45·6 inches, 20 inches above the average. A table showing the measurement of a large number of trees in the garden is given, which should form a valuable basis for comparison in future years. A menagerie, a deer-park, recreation-grounds, a museum, rock-garden, library, are all included in this fine establishment.

Wood Notes.—There is no better-known man in the United States than Mr. Julius Stirling Morton, the originator of the grand national holiday known as "Arbor Day." This holiday originated in the far-sightedness of Mr. Morton, who noticed, as we are informed, the great waste going on in the forests of the Far West, for which no provision for the future was made by replanting. To this has also to be added the enormous loss attributable to forest fires—the last of which will never be forgotten. Mr. Morton passed a bill which became law, establishing a holiday throughout the Union on April 22, on which day all who can go forth, and under proper instruction, plant young trees to make good the losses caused by commercial and social requirements, and thus comply with the injunction attributed to the old Highland laird, to keep "stickin' in a tree here and a tree there," because, certes, "they'll grow whilst ye're sleepin'." Mr. Morton is Secretary of the Agricultural Department at Washington, and therefore a great power in the Western Republic. "Affiliated" to the major office are those of meteorology, experimental stations (which have been the means of enriching the botanical and pomological growths of the United States, by the introduction of new edible, and ornamental and useful plants), entomology, ornithology, vegetable pathology, microscopy, irrigation, and road-engineering. Mr. Morton has been employing his holiday here in making some inquiry into the condition of land tenure, farm leases, cost of production of cereals, &c. It was owing to Mr. Morton's courtesy that we were ahead of our own *Board of Agriculture Journal*, in publishing a brief synopsis of American fruit crops in these columns in the last week of August.

London Pansy and Violet Society.—The general meeting of this Society was held at the Guildhall Tavern, E.C., on the 3rd inst., under the presidency of Mr. Wm. Robinson, F.L.S. There was a good attendance of members, and much enthusiasm prevailed. It was determined to hold a show in London next May or June, and a schedule of prizes was considered and adopted, each modern type of the Viola being represented. In view of the decision of the Viola Conference, held at Birmingham in August last, classes for the miniature and rayless types are included. The President (Mr. Wm. Robinson) offered liberal prizes for the best baskets of plants of rayless Violas in bloom, arranged for effect. Mr. Wm. Robinson was re-appointed President for the coming year, Mr. Ranger Johnson as Hon. Treasurer, and Mr. A. J. Rowberry was appointed Co.-Hon. Secretary with Mr. Geo. McLeod of Chingford. Messrs. E. R. Smith and Mr. G. W. Cook were elected to fill vacancies on the committee. The Hon. Treasurer placed his balance-sheet on the table, showing that all prizes won at the last show had been paid, leaving a satisfactory balance in hand.

Illustrations of British Fungi.—We are informed that Dr. M. C. Cooke is endeavouring to dispose of the remaining copies of his great work *Illustrations of British Fungi*, chiefly in consequence of an affection of the eyes of a threatening character. It will be remembered that this book was produced privately by the author at his own expense, and is acknowledged at home and abroad to be one of the most complete and remarkable works ever attempted on this subject. It was issued to subscribers in seventy-six parts, at the subscription rate of 5*s*. 6*d*. each, and when complete in eight large volumes, containing 1200 coloured plates, at something like £30 Feeling that such a large and, consequently, costly book was beyond the limits of a large number of students, the author now seeks communication with *bonâ fide* "fungus hunters" with limited means, with a view to such modification of the terms as will make it possible for them to become its possessors To this end he is prepared to make a substantial sacrifice, and as only about fifty copies are involved, we should recommend all who are interested to put themselves in communication with the author at once, at 146, Junction Road, London, N. The work is a substantial addition to English Botany, and should be on the shelves of every public library, and in the possession of every local field club and natural history society, to whom the same liberal concessions would be made as are intimated above. As a final inducement, it is urged that when this "remainder" is sold the complete work will become scarce, and advance in price, hence its purchase at any reduced rate would be a safe and profitable investment. It is only recently that the produce of sales fully covered the cost of production; hence the only remuneration for ten years of continous labour and anxiety, has to be derived by the author from the sale of the few remaining copies.

Bermuda.—The small colony of Bermuda, 600 miles from the coast of the United States, in the North Atlantic, furnishes, says the *Kew Bulletin*, a large proportion of the early Potatos and spring Onions consumed in New York. It grows the variety of Lilium longiflorum known as Harrisi, and exports the bulbs to the amount of over £21,000.

LÆLIO-CATTLEYA × DECIA
(LÆLIA PERRINII ♀, CATTLEYA DOWIANA AUREA ♂).

To increase the number of beautiful plants to be had in flower in the dull autumn and winter season, is one of the most important of the hybridist's good offices, and already have we to thank them for many such. The handsome Lælio-Cattleya × Decia, for which Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, obtained a well-merited First-class Certificate at the meeting of the Royal Horticultural Society's Orchid Committee on November 27, is one of the latest, as it is one of the best, of these desirable novelties.

The *début* of a new hybrid Orchid is its most trying time in these days. Years ago, when but few were at work in the field of Orchid hybridisation, the plant used to be grown to something like what might be called a fair specimen before exhibiting; but now its character at the start has to stand on its merits, as seen in its first and generally its poorest flowers.

The plant of Lælio-Cattleya shown was no exception to the new rule, for it was a small one, although it bore an almost disproportionately large and beautiful flower. It will be seen by reference to the illustration (fig. 89) that the ample labellum of the new hybrid shows plainly in its abruptly turned-down front of the lip the influence of Lælia Perrinii, and in many of its other characteristics it follows that species, while C. Dowiana aurea chiefly tends to give larger proportions to the flower. The sepals and petals are light rosy-lilac, with silvery-white base and midrib; the interior of the tube of the lip is pale purple, with white veining; the front portion rich mauve-purple.

Fig. 89.—LÆLIO-CATTLEYA × DECIA: ROSY-LILAC, LIP PURPLE.

HIGHBURY, BIRMINGHAM.

Than the collection of Orchids got together by the Right Hon. Joseph Chamberlain at his Birmingham residence, none in the Midlands is finer, whether we take its extent, the novelties and rarities contained in it, or the perfect cultivation shown by the health and vigour of the plants. A recent visit revealed in the house at the far end of the corridor a number of plants of Dendrobium Phalænopsis Schroderiana in bloom with great variety in the colouring and markings, some of the light-coloured blooms being uncommonly beautiful in this respect, one in particular, D. Phalænopsis Schroderiana highburyensis, which received an Award of Merit at a meeting of the Royal Horticultural Society. A plant of Dendrobium album possessed some fine racemes of flower; and some plants in bloom of D. formosum giganteum, a number of Calanthe vestita in variety, and Phalænopsis grandiflora and amabilis in robust health and profuse bloom, made this house very gay. Close by was a span-roofed house filled with Odontoglossum crispum in grand health, and some thousands of plants of Odontoglossums are in a long house with a northern aspect. Another house is nearly filled with Lælia anceps varieties, the plants showing a perfect forest of bloom-spikes In another house a quantity of specimens of Lælia autumnalis and L. albida are showing flowers very freely.

The Orchid show-house was very bright with flowers, including a very fine specimen of Barkeria spectabilis, Cattleya marginata, fine specimens of C. Bowringiana, Masdevallias Chelsoni and ignea, the rare Cattleya Mastersoniana, the result of a cross between C. Loddigesii and C. labiata, an exceedingly pretty flower that partakes of the characteristics of both parents. Cattleya Fausta delicata, a cross between C. Loddigesi and C. exoniensis; several selected varieties of C. labiata, C. speciosa, a massive

panful of Pleione lagenaria in full bloom; Oncidium tigrinum and O. venustum, Odontoglossum Cervantesii variety, O. grande, and O. Insleayii splendens, very fine; Trichosma suavis, Ornithidium Sophronitis, like a miniature pale-coloured Sophronitis grandiflora; the pretty Galeandra Devoniana, Vanda cœrulea, in flower; and a number of seedling Orchids raised by Mr. Burberry, which are in very promising condition.

It is not Orchids alone which make Highbury famous as a plant treasury, a general collection of plants being cultivated, and much cut bloom is required of the gardeners. Several of the glasshouses were gay with Chrysanthemums, which had they been exhibited at the Town Hall show, would have stood a good chance of securing honours for Mr. W. Earp. Some novelties were remarked in fine form. Seedling Anthuriums were nicely furnished with spathes, and even a batch of them in small pots were showing them; a span-roof house filled with Cyclamens deserve attention for the evident admirable cultivation, and richness and variety of the colours, and the same may be said for a house full of young zonal Pelargoniums, and another filled with Primulas in fine condition. A house filled with Roses in pots was remarked, the plants breaking freely. In the glass corridor which leads from the conservatory and fernery, and which in reality is a conservatory, and from which other houses branch off, a plant of Lasiandra macrantha, trained over the roof, is laden with its rich, large, bluish-violet flowers; and in one of the houses were a quantity of plants in full bloom of that somewhat useful old-fashioned decorative plant, Reinwardtia (Linum) trigynum. Plants that blossom in the winter season are much cultivated at Highbury, and numbers of Euphorbia, Poinsettia, winter-blooming Carnation, Salvia, and Bouvardia are met with. Browallia elata major, with its rich blue blossoms, can lay claim to being a very useful winter decorative plant.

Altogether Highbury is, in the matter of good cultivation, up to the mark, and this includes fruit. Mr. Earp, who shortly relinquishes his charge of these gardens to become a nurseryman at Hereford, has done his work well. The Orchid department will, as before, continue under the management of Mr. Burberry. *S. H. B.*

HOME CORRESPONDENCE.

DISHING FRUIT.—Everyone will acknowledge the fact that the appearance of fruit when dished greatly depends upon the way it is done, and those who are frequenters of horticultural shows cannot have failed to observe that it not unfrequently occurs that inferior fruit is placed before that which is better, for the simple reason that it is well-dished, and the other fruit is not. The way fruit is set up at shows does not, however, concern all gardeners, for there are many growers of fine fruit who do not compete at exhibitions. Still, the condition in which the fruit they grow is placed upon their employer's table should be a matter of interest to every gardener. It is over the dinner-table that the gardener is commented upon, and the quality of his productions discussed. The vegetables may be excellent, and the floral decorations rich, and executed in good taste, but these matters do not in a general way compensate for the presence of inferior fruit. Now, the appearance of the finest fruits may be spoiled by the carelessness or the inexperience of the person who dishes it. The bloom of a bunch of Grapes which has taken months of care to produce may be spoiled by being rubbed by the sleeve of a woman's dress or a man's coat. Peaches which have been gathered with a wadding-padded hand are easily blemished by pressure of the fingers, and a Melon disfigured by having the stalk rubbed off it. Nevertheless, the majority of gardeners have no control over the dishing of the fruit upon which much of their reputation as gardeners depends. They hand the fruit over to the housekeeper or confectioner, as the case may be, and having done this, their control is at an end. There may be gardeners who are perhaps satisfied with this arrangement, having enough to do without dishing fruit; be this as it may, the practice is wrong, and it behoves us gardeners to do what we are able to get it altered. This should not be a difficult matter, as any reasonable employer or housekeeper on hearing it explained would agree with the justice of such an alteration. Of course, this applies only to country seats; it cannot, for obvious reasons, be carried out in London houses or elsewhere at a distance from the garden. This, however, is not of so much importance, because fruit that has been packed is not expected to be so perfect in appearance as that which is taken direct from the garden to the house. I do not write this note because I have to submit to a grievance of the kind myself—on the contrary, I have the satisfaction of dishing the fruit that is grown in our garden—but because I should like all my fellow-craftsmen to do likewise. While upon this subject, I may remark that fruit when placed in a dining-room should be correctly named. A name neatly written upon a clean slip of paper is no disfigurement, and it tends to create an interest in the garden and the products taken out of it. Before I adopted this practice, I was frequently asked by my employer or his guests the names of the fruits which had been served at table. *Nemo.*

APPLE MANX CODLIN.—While there exists such a demand for new and higher coloured varieties of Apples, planters are apt to forget old favourites; and where full crops of useful culinary fruit are looked for, without anything remarkable in point of size, the good old Manx Codlin, and others like it, should be planted largely, say from six to twelve trees in the garden or orchard. In years poor in Apples, like the present one, there is no variety which is so useful, it being a regular and good cropper in most parts of the country. Its good cooking qualities are undoubted, and the tree is a compact grower, and it may truly be termed the Apple for the small grower, or for those whose space is limited. It may not generally be known that this variety succeeds upon its own roots, and that cuttings strike freely, the trees bearing well when thoroughly established, and the weather is favourable to a good set. *S.*

GRAFTED APPLE TREES.—In the garden belonging to Sir Samuel Montagu, M.P., at South Stoneham House, near Southampton, I recently observed the best example of grafted old Apple trees that I had till then met with. Thirty-two years ago a large number of standard Apples were planted, and some of them were not of the best quality. Four years ago, or twenty-eight years after Mr. Hall, the gardener at Stoneham House, commenced to improve them by grafting upon them improved, and, in some cases, modern varieties, and with splendid results. The branches from these grafts measure 8 feet in length in many instances, and capital crops of very fine fruit were borne on them this year. Warner's King, Red Astrachan, Ecklinville Seedling, Gloria Mundi, Emperor Alexander, and Wellington are varieties which have done remarkably well. Several trees were grafted with Ribston Pippin, and the clean and vigorous shoots made by the grafts of this favourite Apple have not failed to produce magnificent fruit; indeed, I have never seen finer fruits than these trees carried this year. The new Apple Bismarck, but two years from the graft, was bearing a grand lot of fruit. These trees have clean stems 7 feet high, and the branches that were grafted were cut pretty close in to the fork from whence they sprang, cleft-grafting being resorted to. *E. M.*

WASHINGTON APPLE.—This variety, alluded to in a note by Mr. Evans (see p. 627), I saw in bearing as a bush in Mr. Leigh's garden, Barham Court, Maidstone, and the fruits were quite equal in appearance to those which I have seen elsewhere grown under glass. This was under garden culture, and that of the very best kind; but whether the variety is deserving of extensive cultivation is another matter, and I would not recommend it in a cold district. Probably it would do well south of London as an orchard fruit. It is not a variety that will keep any considerable period of time. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

RUBUS PHŒNICOLASIUS (JAPANESE WINEBERRY).—This species appears likely to be a very useful addition to our hardy fruits, and is well worthy of a trial. It ripened a good crop of fruits here this season, commencing during the first week in September and continuing for about three weeks. The fruits, which are very similar to those of a small Raspberry, are borne in terminal panicles more after the style of the common Blackberry; they are bright red in colour, and of an agreeable brisk flavour, containing none of that mawkish taste, which in my opinion, spoils all Blackberries. The plant has grown more vigorously this season than last; but whether it will always fruit as freely remains to be proved. The peculiar bright red appearance of the stems in early spring, caused by the abundance of its slender spines, gives it a very ornamental appearance when leafless. For the shrubbery border it deserves cultivating for that reason alone, its foliage being distinct and pretty. The present is a good time to plant it. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

BOUVARDIA LEIANTHA.—Several plants of this old, but still one of the best of the Bouvardias, are at the present season in bloom in the cooler greenhouse at the Birmingham Botanical Gardens, and with its scarlet blossoms, long, slightly pendent and graceful branches, it is such an excellent variety for standing in vases, and is useful in other ways. The treatment required by the variety is identical with that afforded others. *S. H. D.*

SPORTING OF VIVIAND MOREL CHRYSANTHEMUM.—The other day I received a flower of V. Morel (green sport) from Mr. Underwood, and I note in the *Gardeners' Chronicle* to-day, p. 668, what Mr. Willis says about this variety sporting in two different places; but my stock sported last year, and this year it has sported in France as well as at Harpenden. It certainly is curious how the same variety sports about the same time in different places; and perhaps some disbelieving people will now believe that what I have shown them was in reality a green Chrysanthemum. I have been taxed with having dipped the blooms into green dye or something else, and trying to sell plants by deceit. Would Mr. Underwood kindly give the size of the flowers he grew, for I must confess that I propagated my stock rather hard, and had not an opportunity of seeing to what size it would attain, as the blooms were rather longer in opening than the ordinary Viviand Morel, I felt anxious to let them be seen at all the shows I possibly could, and I sometimes cut them before they were half expanded. I had some blooms in May last, which were about 4 inches across and 4 inches deep, but these were from very small plants; most of my plants have been left untouched, and have carried from twenty to fifty small flowers, and these are small plants rooted as late as midsummer. I have also a sport from the green one (Ethel Amsden) this year. This plant was disbudded to two flowers, one of which was pink in the lower half, but pure green in the upper half of the flower. The other flower was pure white, with a green patch on one side of the flower. These flowers were like the ordinary V. Morel as regards size and form, the latter being the one which I showed at Edinburgh and Glasgow by the side of Ethel Amsden (the green one), where it caused quite a sensation. I wonder what next we shall get from V. Morel, perhaps a blue one! *W. Wells.* [The occurrence of sports simultaneously in widely-separated localities may be due to the plants having all originated from the same stock to begin with. One green Chrysanthemum has been figured lately in a Japanese horticultural journal. ED.]

MILLA BIFLORA FLOWERING OUT OF SEASON.—I have grown Milla biflora in this garden for years, and it generally blossoms in the dog-days, and it makes me cool to look at it. But this year it has put off its performance till now, and I have had during the latter part of November, and at present in this opening December, a good many in blossom. Simultaneously with this, and some weeks I sholud say before their usual time, the Snowdrops have also begun to bloom; and in one bed Milla biflora and Galanthus cassaba (from Asia Minor) are together in evidence. This is curious, because I have so often said Milla biflora is the most beautiful white flower we have, unless it be a Snowdrop, or, *vice versâ*, nothing can touch a Snowdrop if Milla biflora be out of the way; but I never dreamt that they could ever seem to vie with each other, and that they would display their loveliness at precisely the same time. But what can have happened to retard the one flower and precipitate the other? There has been nothing at all unusual in my treatment of Milla biflora this year, and the reasons for this exceptional tardiness on its part are quite hidden from me. Apropos, however, of white flowers, which are always very much prized, I may perhaps mention another, which is the only white thing I know of as being fit

for such company—I refer to Watsonia iridifolia O'Brieni. It is most chaste and beautiful, and there cannot be two opinions about its unusual loveliness; but only twice have I seen it in blossom, once in the Royal Gardens at Kew, and once in my own garden. This latter must have been owing to a fluke of some sort—another instance, I suppose, of caprice on the part of a flower; for though I have bought it several times, I have done nothing with it at all since then, and it has been a most heart-breaking subject to deal with from every point of view. But the vision I had once or twice seen haunted me, and remained fixed in my memory, and I felt quite unable to give up the hope of seeing this Watsonia do well in my hands. Nevertheless, my own efforts were completely exhausted, and I felt driven to write letters to any quarter from which I thought enlightenment could come. At last there has been the much-desired reward, and you will see in the letter which I send to you from M. Van Tubergen, jun., that he has had just the same difficulty that I have had here; but he has found his way out of it in a kind of miraculous way. I have not thought of asking him if his letter may be published, but he has said nothing against it, and I cannot doubt at all that he would gladly allow it for the good of the cause. I therefore enclose this valuable communication to you just as it came; and really it seems to open a way for managing many Cape bulbs besides Watsonia iridifolia O'Brieni which had never been dreamt of. I only make bold to say that Milla biflora, a Snowdrop, and Watsonia iridifolia O'Brieni are such a trio of exceptional loveliness, that I think it would puzzle any one to make a quartette by naming a fourth white bulbous plant that is fit to accompany them. Spring, summer, and autumn are beautifully represented by Galanthus cassaba, Milla biflora (provided only that these be true to their proper season), and Watsonia iridifolia O'Brieni. *H. Ewbank.*

WATSONIA O'BRIENI.—I am glad I can point out to you a method of cultivation which will bring the Watsonia O'Brieni to reason. After an almost complete failure with this choice plant, the idea struck me that during the resting season, the Cape bulbs are subjected to an immense solar heat in their native country, whereas we usually keep the resting Cape bulbs in a shed kept at about 45° to 50° Fahr., during the winter, which is about 60° less than they are treated to at home! I consequently in December, 1893, divided my lot of bulbs of the Watsonia O'Brieni into two parts, the bulbs looking very sadly, and kept one part in the usual place, while the other part I put into a box which I placed under the side stage of a hothouse about 2 inches above the hot-water pipes. I simply laid two strips of wood of about 2 inches thick on the pipes and placed the box on them. The bulbs soon became perfectly dry, and on cold days when there was a good fire kept on, they even became hot, so hot that one of my men thought I was going to roast the bulbs! In spring these bulbs were reduced to the state of bricks, but on planting them in March, I was most agreeably surprised to find that they had formed roots in less than three weeks, whereas the cool-kept bulbs did not commence growing until July. The roasted bulbs bloomed splendidly early in September, and are now fat, fully matured tubers, whereas the other lot is still in full vegetation, no new bulbs being as yet formed, and no flowers having been produced. The same tale might be told of various Antholyzas, Watsonias, Ismenes, &c. *C. G. van Tubergen, Jr.*

WATER-TIGHT STOKEHOLES.—There is, perhaps, nothing of greater importance—nothing more essential to the welfare of crops generally in all horticultural establishments—than a stokehole which is perfectly and absolutely water-tight. Dwellers in low-lying districts know all too well in scores of instances something of the many anxious nights, with their attendant cares and worries, when things are the reverse. Cases of this kind are frequent in seasons that are ordinarily wet, and when the rainfall has spread itself over a considerable period of time. Such being the case, it is little wonder, with the recent exceptional floods, that few, if any, have escaped. Never before, perhaps, were stokeholes been subjected to so severe a test, and even those which are sound were flooded from the surface by the water pouring over into them. Serious and inconvenient enough even this may prove when the surface all around is at saturation point, and will not permit of the rainfall passing away as usual. Situate here, in the valley of the Thames, the adjacent property to Hampton and Hampton Court was flooded for several days past. Some of the gardens on the river-bank were several feet below water, notably that of Mr. O'Hagan's, at River House. With some 5 feet of water in the main road at this particular point on Sunday, Nov. 18, what shall we say for the plant-houses and gardens? The hosts of market-growers and florists, albeit a little removed from the river itself, had a very anxious time of it. In some instances where the stokeholes were faulty, the water put in an appearance nearly three weeks earlier, but with many more it was kept under for a much longer time. Scarcely an instance was there in the whole district exempt from flooded stokeholes or greenhouses. In some instances the paths in the latter were impassable. In my own case, one boiler fixed in a ship's tank was completely submerged with the overflow from the surface pouring into it. For this, happily there is an immediate remedy. Not so, however, where the water flows upwards from the bottom like a spring, or finds its way through faulty work in the sides. Throughout the whole of this district great care and not a little experience is necessary to render a stokehole perfectly and absolutely water-tight. The every-day bricklayer is not to be depended upon unless he has obtained his knowledge through his own or other's failures—and failures in these matters are most expensive. In not a few instances the market-growers superintend the making of these stokeholes personally, and in some of the larger holes several tons of the best cement are employed in the work. As it may be of service to some of your readers, I will briefly give a few details of the way stokeholes are rendered water-tight. In the first place, the hole to be excavated must be carefully worked out in every detail. In deep stokeholes allowance is made for 18 inches of cement concrete at the bottom. This is mixed in the proportions of either two and one, or three and one, the first being decidedly the safer. In putting in the bottom every precaution must be taken that the ballast is clean and free from marl. Where the ballast excavated is clean and good, and in plenty, concrete is used to form the side-walls of much the same strength as above-named. In the majority, however, bricks are used, and where this is so, the width of the hole must be sufficient to permit of 2-inch walls on each side, with an additional space between the wall and the soil to use the trowel for cementing the wall as it is built up. In building up the side-walls, cement and clean river sand only must be used at the strength of three and one, and with every 18 inches of work, give a coat of neat cement ¾ inch in thickness on the outside of the wall. This is a most important item, and should be well done. Formerly this coat of cement was put on the inside of the stokehole wall, but experience has shown this was wrong, and it is now put on the reverse side, and so stops the water percolating through the wall at all. Thus placed, the great weight of water in the land all around is harmless. When the walls are completed and dry, the space may be filled in with tempered clay, if procurable. This will greatly assist security, or the inside of the wall may be faced with cement also if clay is not obtainable. It is best to start the walls on a layer of neat cement, and on no account to use perfectly dry bricks, as these absorb the moisture too quickly from the cement. Carry the walls two courses of bricks above the surrounding level, and cement them to the top; this will keep out ordinary surface-water. The floor of the stokehole immediately in front of the boiler should be pitched with blue Staffordshire bricks to receive the falling clinkers, and keep the heat from direct contact with the cement. The floor of the ashpit should also be similarly treated. Such work, of course, can only be successfully accomplished when the land-water is low, which is usual in summer or very early autumn. It will be seen that the making of stokeholes in this district is a serious matter, but if thoroughly done as described above, the work will last a life-time. *E. H. Jenkins, Hampton Hill.*

FRUIT AND FACT.—It hardly seems possible nor desirable to add to the trenchant force of the facts marshalled by Mr. George Bunyard, on page 636 of the *Gardeners' Chronicle*. To ask for or admit further evidence seems to us, who have the privilege of his acquaintance, seems like painting the Rose or adding sweet perfume to the Lily. On the same page, however, Mr. B. Wells also presents some valuable facts, and there have been many others, and may be more, so that we may say that the time is near at hand when Mr. Blackmore will gracefully retire from an untenable position, and confess himself in the main mistaken. Those of us who have followed him in his severe account of the merits or rather demerits of so many good fruits in the last edition of Dr. Hogg's book, are not greatly surprised at the position he has now assumed. Possibly, were all our Apples, Pears, Peaches, Plums, &c., angels, he would pick flaws in their faces or feathers. But we would love the angels, and shall find health, wealth, and happiness in fruit growing all the same, only regretting that Mr. Blackmore cannot do likewise, as of yore. For hundreds beside myself I can affirm, that such solid facts as that of Mr. Bunyard of Maidstone, Mr. Francis T. Rivers of Sawbridgeworth, and others, who have hitherto chiefly tried, through raising and selling fruit trees to the public, taking to the growth and sale of fruit themselves, thus voluntarily and of free choice entering the same boat as their customers, will suffice to give fruit culture such a fillip as no other object-lesson could afford. Only last summer I had the opportunity of seeing the large breadths of Apples, Plums, &c., planted out for fruiting purposes at the nurseries at Sawbridgeworth. I have also recently travelled some hundreds of miles to see, hear, and know up-to-date facts as to fruit growing prospects among us. Generally they are all that the most enthusiastic horticulturists could expect or desire. The new industry is spreading far and wide, as fast and as far as is prudent, possibly. In all directions one meets with proofs that lectures, object-lessons, examples, exhibitions, brochures, handbooks, have not been in vain. Our orchards and fruit farms still continue to be planted, and considerable efforts are being put forth to clean and resuscitate old fruit trees and bushes. Efforts are also being put forth to obtain lower swifter rates of transit, and cheaper easier methods (if that be possible) for partial cooking, and the exclusion of air from cans and bottles, since all that is essential for the conversion of perishable fruits and vegetables into commercially imperishable commodities. As things are, fruit has not been cheap in the rural districts this year. Good Pears that have been allowed to rot under the trees elsewhere have sold well in Bury St. Edmunds throughout the season, and I have not been able to purchase any Apples this year under 6*d*. a quarter, or the high price of 8*s*. per bushel, though I confess I saw as good or better, still rather a rough-and-ready sample, of English Apples, sold in Covent Garden Market, 4*s*. a bushel. *D. T. F., F.R.H.S.*

LILIES AT OAKWOOD.—My annual note on our Lilies will be shorter than usual this year. The frost of May 21 was most destructive, except in especially favourable situations. In the bed in the wood at Oakwood, L. auratum, owing to the mildness of the weather, had made tall stems, and the growth was vigorous, when the frost came and nipped the tops, so that in the flowering season there was but one fine plant in bloom, with more than a dozen frosted ones round it. Lilium Humboldti had unusually strong stems, and these were all browned; L. candidum promised to be very fine, but in exposed situations the plants were cut down, although within not many yards a few plants which stood in sheltered places bloomed well; L. superbum, cut by frost in some situations, was fine in others; L. Browni, L. japonicum odorum, and L. Krameri were all cut; L. Martagon dalmaticum was cut in the wood, but it was fine on the hill. In a sheltered place on the hill, L. auratum virginale was especially fine. In the wood at our cottage garden, which is dry and warm, the Lilies bloomed well; and in this garden almost all the Lilies, especially L. auratum and L. speciosum, planted in sunken tubs and large boxes, sheltered by shrubs, were as fine as usual. In one tub with the bottom out, we had the finest plant of L. tigrinum jucundum I ever saw, 8 feet 9 inches high, with ten flowers. In the greenhouse here, L. Wallichianum superbum and L. Henryi bloomed well. I believe the last to be a valuable out-of-door Lily, but have not yet grown it, except under glass. A plant of L. Wallichianum superbum had twenty-three stem bulbils, like those of Tiger Lilies, so it may be readily propagated. *George H. Wilson.*

ECHINOCACTUS ZUCCARINIANA.—I have read with much interest Mr. Watson's interesting note on Echinopsis Decaisneana in this week's *Gardeners' Chronicle*. It is a treat to get an article on Cacti. I enclose herewith a photo of Echinopsis Zuccariniana which bloomed in my greenhouse this season; it had six blooms, but one was accidentally knocked

off. I may say, I have been very successful in blooming the Echinopsids this season, having had a nice lot of bloom on Eyriesii, Oxygona, Duvalli, Zuccariniana, Decaisneana, and multiplex. I have several other kinds which have not bloomed, viz., Pentlandi, tubiflora, cinnabarina, Schelhari, triumphans fl.-pl., Huotti, Mulleri, Fischeri, Lagermanni, and Wilkensii, but some of these are scarcely large enough, I think. I have not yet tried Mr. Otto Overbeck's method of growing them in the open air, but I hope to do so another season. I have been fortunate enough to flower Echinocereus procumbens this year. *Wm. C. G. Ludford.*

CEDAR OF LEBANON.—I saw a note in the *Gardeners' Chronicle* respecting the Cedar of Lebanon only producing cones on independent branches, and after reading it, I inspected my trees here, and I find exactly what Canon Ellacombe stated, that only here and there on the trees branches bore cones, and the branches that were bearing the new cones were the same that bore them last year. I have made a note of it, and will watch other years if they act in a similar way. A large Cedar growing in the pleasure-ground, is bearing cones east, west, north, and south, so exposure to winds does not seem in any way to affect them. Why one branch should bear cones and the others not, certainly requires some observation to ascertain. I particularly notice that our Pinus Ayacahuite is bearing in a similar manner. *Weston Birt.*

SHOULD ROSES BE PROTECTED IN WINTER?—I should like to add my testimony to the injurious effect of long manure for winter protection. In a mild winter we found the protection caused buds from the base of the plants to make shoots which were drawn up, weakly, and tender, and, as sharp frosts in spring usually follow a mild winter, these tender shoots are likely to be killed. Now these buds at the base are just the ones we want to lie dormant, so that we can prune back to them in the spring. On the other hand, in a severe winter the manure gets very wet, which freezes and forms a block of ice round the plants. We now earth the plants up like Potatos, and since doing so, we have not lost so many plants in winter, as the frost, however severe, does not injure the plants below the soil. *J. L.*

SOCIETIES.

PEEBLESSHIRE HORTICULTURAL ASSOCIATION.

December 4.—The usual fortnightly meeting of the above association was held in the Lesser Good Templers' Hall, on Tuesday evening. Mr. A. Dickson, gr., Glenormiston, gave a very practical and interesting paper on "Bush Fruit," confining his remarks principally to the Currant and Gooseberry. After describing the uses which were made of the Black Currants by different nationalities, he took up their propagation, and fully described how it should be done in regard to the formation of bushes of different habit. By dressing the cutting and leaving a few buds at the top to form branches, a clean stemmed bush could be had; or, by leaving all the buds on the cutting, a bush with shoots rising from the surface of the cane made, the writer considered, the best, as they could always be renewed, and were longer lived, and not so easily damaged as the clean-stemmed bushes. An open situation he considered the best to plant Currants on, but they succeed fairly well in moderate shade between the rows of standard fruit trees. They also succeed well upon high elevations, giving bountiful crops in sheltered positions upwards of 500 feet above sea-level. They delight in a deep rich mellow loam, upon a cool base, and seldom do well on light sandy soils. He fully described how light soils could be made to suit the requirements of the Currant by the addition of clay. He dwelt on the arrangement and planting, the distances they should be put apart, and strongly urged that every young plant should be planted firmly, as this had more to do with early fruitfulness than most people imagined. Mr. Dickson emphasised his remarks upon this point, and said firm planting was productive of fibrous roots. Fibrous roots were productive of fruit; they never travelled great distances, and were always under control, easily fed, and did not disturb neighbouring crops. Plenty of fruit and vigour in the trees was what everyone aimed for, and that could be had if the above points were carefully studied, and the trees kept in good health. The red and white Currants, as far as propagation was concerned, were treated in much the same way as the black varieties. But they would thrive in bleaker positions; they preferred high to low sites, but succeeded well on the latter when the soil was properly drained. They had been known to do well where the soil did not exceed 3 inches on a pure sandy bottom, and gave crops over the average. Mr. Dickson dwelt at length upon the arrangement of the red and white Currants so as to form screens for vegetable quarters, also as pyramids and standards upon borders by the sides of walks, which were both ornamental and useful. Useful crops of Currants, he said could be had in various parts of the garden, but if they wished fine fruit and plenty of it, by all means give them a good piece of ground on an open situation. He went on to describe the best methods of training and pruning red and white Currants, and enumerated some of the best varieties in cultivation which he could recommend to planters. Mr. Dickson next took up the Gooseberry. It was known to succeed better in Scotland and the north of England than it did in the south, and only ceased to be productive at an elevation of 950 feet. He fully described the mode of propagation, the soil which suited it, and the arrangement of the plants, so as to get as much as possible out of the ground. The best time to plant, he considered, was about October, a little before the leaves fell. They should be planted firmly, and not too deep, leaving about 3 inches of a clean stem. He went on to describe the mode of training and pruning, beginning with bushes one-year old, and he described the best way to use the knife to get a fine, shapely, and productive bush. He strongly advised mulching, if the bushes were in a convenient place for doing it. If a mulching was put on in the autumn, it got well washed in before summer, and he also found it beneficial in keeping off the ravages of caterpillars. He also strongly advised watering in dry weather, as want of moisture at the roots had a bad effect on the fruit as well as the young wood. A list of the best varieties was given, including those which do in Peeblesshire; the varieties were very numerous, but he could get a good long season out of five or six sorts.

NATIONAL CHRYSANTHEMUM.

November 29.—The annual dinner of the above society took place at Anderton's Hotel, Fleet Street, on the above date, Sir Edwin Saunders, the President, presiding over about 140 guests, including Coles Child, Esq., President of the Bromley Chrysanthemum Society. Mr. Child was accompanied by the Secretary and several members, to receive the Challenge Trophy, won by the Bromley Society in November last, a number of the leading members of the present society being also present. At the back of the chair was an attractive bank of plants, the Challenge Shield, the Holmes Memorial Cups, the President's piece of plate, and other special prizes being prominent. The tables were laden with blooms of Chrysanthemum, and a good supply of fruit was sent in by several members of the Society.

In proposing the toast of "Prosperity to the National Chrysanthemum Society," the President congratulated the society on its progress, one hundred and twenty-seven members having joined during the year, the total number of members now being 734. A general review of the exhibitions of the year was then given, from which it appears that all classes were well represented, but the incurved varieties were not so well shown as usual. A year-book is to be published, which will no doubt prove as useful as it will be interesting. Some details as to the amount of sunshine as automatically registered at the Royal Botanic Society's Gardens in the years 1893, 1894, were given, and which we reproduce from their great intrinsic importance to cultivators in the vicinity of the metropolis:—

1893.	Hours.	Mins.
January	12	30
February	40	23
March	116	16
April	198	34
May	199	46
June	196	23
July	163	2
August	203	30
September	131	58
October	111	58
	1374	18

1894.	Hours.	Mins.
January	34	20
February	59	46
March	118	48
April	103	51
May	150	50
June	145	25
July	152	22
August	121	26
September	85	7
October	41	1
	1012	56

The toast of the affiliated Societies was proposed by Mr. H. Briscoe Ironside, who stated that there were now 111 societies in union with the National Society, several of them in distant parts of the world. The Challenge Shield and a cheque for £10 were then presented to Mr. Coles Child, the President of the Bromley Society, who suitably responded, trusting that a determined effort would be made by other societies to win the trophy next year, though it was the determination of the Bromley Society not to let them do it.

The presentation of the Holmes Memorial Cups, the President's prize, and various medals, then followed, each recipient as he advanced to the President receiving a warm reception.

The health of the President was proposed by Mr. Robert Ballantine the chairman of the committee, and suitably responded to. Other toasts followed.

December 4, 5, 6.—The show of Chrysanthemums held by the above-named Society at the Aquarium, on Tuesday, Wednesday, and Thursday last, completes this year's series of shows in London. As was to be expected, the flowers although exhibited in considerable numbers as cut, and on the plants, were below the standard of the chief show of last month; but having regard to the date, the falling off was remarkable only in their size, general good finish being evident in many of the exhibits. In new varieties Mr. R. Owen, Maidenhead, decidedly had the lead of other exhibitors, showing in very fair condition in Japanese vars., Anna Crozy, white, with lilac tips to the florets; Graphic, lilac-coloured, twisted florets; H. L. Sunderbruck, W. H. Lees, Milky White, of an opaque-white, florets reflexing—a very neat flower; Madame Rozain, pale lilac, incurved florets (First-class Certificate); Miss Ellen Terry, with thread-like florets, and a very full bloom; Minerva, clear yellow, with much brightness; Black Prince, dark crimson—a most desirable colour; and Mons. Lemaille, globose and incurved, of a pleasing, soft, coppery-brown hue.

Mr. Charles Lawton, gr. to W. H. H. Broadley, Esq., Welton House, Brough, received a First-class Certificate for Mrs. R. C. Kingston, an incurved variety, of a pale tint of lilac.

Groups.—Several groups of Chrysanthemums were staged, but these were of the usual stamp, and neither as to the arrangement of the plants nor their quality need much be said. They were effective in showing to what use the Chrysanthemum may be put in a circumscribed space, and we saw little more than heads of bloom and the upper leaves, their legs being judiciously hidden, as was fitting at this part of the season. Mr. Norman Davis received a Silver Medal for his group. Mr. W. Davey, gr. to C. C. Paine, Esq., Stamford Hill, a Bronze Medal for a single trained plant of Pink Christine, which stood, as we suppose, for a group, the flowers elevated about 6 inches above the skeleton of the frame. A Silver Medal fell to Mr. J. H. Witty, Superintendent, Nunhead Cemetery, S.E., for a big group of miscellaneous varieties with small flowers, plenty of the latter, but ineffective, owing to the great number of different colours.

Cut Blooms.

Mr. Mease, gr. to A. Tate, Esq., Downside, Leatherhead, was 1st for twenty-four Japanese varieties, a good stand, the best flowers being Violet Rose, Golden Gate, Lily Love, Florence Davis, and Mrs. E. D. Adams; Mr. Perkins, gr. to Hon. W. F. D. Smith, M.P., Greenlands, Henley, being 2nd. This was a stand but very slightly inferior to the first-named, and contained extra-good examples of Robt. Owen, Lord Brooke, Miss E. Beckett, Walter Surman, and Viscountess Hambledon. In this class an extra prize fell to Mr. H. Wells, nurseryman, Redhill. Three others competed, but they were far behind the winners.

The next class as regards number was that for twelve Japanese distinct, and here Mr. Plumb, gr. to J. C. Beer, Esq., Biskra, Watford, was 1st, his best being Mr. G. J. Beer, Captain Torrens, C. Blick, and Etoile de Lyon; Mr. F. W. Slogrove, Gatton Cottage Gardens, Reigate, was 2nd, and but little inferior as regards size of bloom and general evenness. The competition in this class was, as usual, very strong.

For six Japanese, the competitors were rather numerous, but the blooms were below the mark, and no 1st prize was awarded; the 2nd falling to Mr. Plumb, gr., Biskra.

For the best six blooms of new varieties of 1893 and 1894, Mr. Perkins, gr., at Greenlands, received an award of a Silver Medal. We remarked in this stand nice examples of Edith Wynne, James Myers, C. Davis, and C. Blick. Messrs. Wells, of Redhill; W. Forbes, gr., Regent House, Surbiton; Newell, gr., Cornstiles, Twyford; and Morter, gr., High Elms, Farnborough, showed in this class.

The incurved varieties were shown in very moderate numbers, and in the class for twelve blooms, Mr. Mease was 1st, with a nice lot, exhibiting general evenness of size and good quality. C. B. Whitnal was a well-finished bloom, as were less so J. Kean, Princess of Teck, and Miss Haggas. Mr. Newell was 2nd, his stand consisting of blooms of fair quality.

Mr. Chas. Brown, gr., Langley House, Watford, had the best six incurved, distinct, varieties; and Mr. Tysler, gr. to Miss Dorrien Smith, Hartwell Villa, Aylesbury, was awarded 2nd prize for neat, small examples.

Japanese varieties in twenty-four bunches, 1st, Mr. W. Jane, gr. to Miss J. Durning Smith, King's Ride, Ascot, with some fresh-looking middle-sized blooms; 2nd, Mr. Knowles.

Twelve bunches of Japanese, three blooms together, made a good show, but we scarcely perceive the advantages to be gained by thus exhibiting the flower, as it admits of no play of fancy in the arrangements, and makes no call on the skill of the setter-up. The best were those from Mr. Knowles, gr. to Mrs. C. Egerton, Solna, Roehampton, the blooms being of fair quality; 2nd, was Mr. Alderman, gr. to G. Hatfield, Esq., Morden Hall, Morden. Stands of single-flowered varieties were numerous, and the best one for which a 2nd prize was the award made, was shown by Mr. Knowles. The display made by these single varieties was bright and pleasing.

Japanese varieties were shown in collections of six bunches, distinct, six to eight flowers together in a bottle, and here Mr. Newell, gr. at Fairlawn, Wimbledon, was 2nd.

The exhibits of Chrysanthemums by the trade consisted of a collection of cut blooms (named), big vases filled with blooms of Japanese varieties, set off with various foliage, and stood amongst a miscellaneous setting of Dracænas, Crotons, Palms, &c., in pots, shown by Mr. H. J. Jones, Lewisham—an extensive and showy table.

Mr. Wells, Redhill, had a table of cut bloom, backed up with pot-plants, receiving an award of a Silver Medal.

Messrs. H. Cannell & Sons, Swanley, showed numerous blooms, as well as those of zonal Pelargoniums—a brilliant lot, receiving for these and a collection of Potatos and Onions of Eynsford growth, a similar award.

Mr. W. Young, nurseryman, Stevenage, showed Chrysanthemums in all sections, and made a great display, even if the blooms were in many instances very small and ragged, receiving a Bronze Medal.

Tables of miscellaneous flowering and foliage plants were shown by Mr. A. Neville, Fairlawn; Mr. Perkins, Greenlands, Amaryllis; Mr. W. Howe, Parkhill, Streatham; and Messrs. Williams & Sons, Upper Holloway (Silver-gilt Medal). Table decorations and a multitude of devices in which the Chrysanthemum played the chief part, were exhibited by Mr. J. R. Chard, Brunswick Nursery, Stoke Newington, he being awarded a Gold Medal for these.

Cyclamen grandiflora, with chiefly white flowers, were shown by the St. George's Nursery Company, Hanwell; the plants sturdy and well bloomed for this part of the season. A 1st prize was awarded the exhibitors.

A 1st prize fell to Mr. Knowles, gr., Solna, for twelve examples in pots of Primula sinensis fimbriata, the plants well furnished with pyramidal heads of flowers; 2nd, Mr. A. Newell.

For a like number of double-flowered varieties, Mr. Mease was 1st, these including Gilbert's and Carmichael's strains.

Floral Committee.

A fully-attended meeting of this body took place at the Royal Aquarium on the 4th inst., Mr. R. Ballantine being in the chair; and a goodly number of novelties were staged for consideration. First-Class Certificates of Merit were awarded to the incurved, large-flowering R. C. Kingston, a full-sized well-built delicate pink variety, from Mr. Charles Lawton, The Gardens, Welton House, Brough; to Japanese La Meije, one of M. E. Calvat's seedlings, a large white incurved Japanese of average size and very promising, from Mr. W. H. Lees, the Gardens, Trent Park, Barnet; to Japanese Pride of Swanley, a large white Japanese, very full, which gained a unanimous award, from Messrs. H. Cannell & Son, Swanley; also to Japanese Madame Rozain, a broad-petalled silvery-pink flower, large and bold, from Mr. Robert Owen, nurseryman, Maidenhead; and to Pompon Dolly, small, bright yellow in colour, very compact, from Dr. George Walker, Wimbledon, was commended.

Other promising Chrysanthemums were Potter Palmer (C. E. Shea and E. Beckett), a large white Japanese, somewhat ragged as shown; Le Ministre Léon de Bruyn (C. E. Shea), a broad-petalled bright yellow Japanese variety; Mrs. G. J. Beer, pink, with a large creamy centre—a variety likely to win the highest award another season; Japanese Golden Beauty, deep golden-yellow, with amber centre, which the Committee wished to see again (W. Slogrove); Japanese, Nellie (Weeks), delicate blush-pink, broad-petalled, the committee also wishing to see this again; Charles Lawton (Owen), a large deep rose Japanese, which the committee wished to see again; H. Bromhead (Masterson), a fine golden-buff incurved Japanese, and Mons. Gruyère (Wells), bright pale rose, with shaded buff centre; and Bronze Beauty (Wells), a deep golden incurved Japanese. Votes of thanks were passed to Mr. R. Owen and to Mr. W. Wells for their collections. First-class Certificates of Merit were awarded to the following very fine varieties of Amaryllis, from Mr. H. Perkins, gr. to the Hon. F. W. D. Smith, M.P., Greenlands, Henley-on-Thames, viz., Lady Esther Smith, pale orange-red, with a greenish-white star in the centre; Lord Sudeley, bright orange-scarlet, large broad segments, very fine; Lady E. Ashley, pale orange-scarlet, with a broad white beam—a flower of very fine quality, and of beautiful shape; and Earl of Arran, orange-scarlet shaded with crimson in the centre—very fine.

SCOTLAND.

GARDENING ON THE COAST OF ROSS-SHIRE.

I should say that 1894 has beaten 1893 as a flower year, but I fancy the latter has to thank the former a great deal for having by its abnormally hot spring and summer so ripened and prepared certain plants as to enable them to make a supreme effort this year, and, consequently, to do what some of them never did here before—namely, to bring forth their flowers and fruit to perfection. As an example of this, I will first take the Phormiums. Five or six years ago, the well-known Dutch firm of Messrs. Ant. Roozen & Son, of Overveen, Haarlem, sent me a valuable present of plants, asking me to experiment with them, and try whether or not they would prove hardy here under the influence of the Gulf Stream. Amongst others were the Phormiums, or New Zealand Flaxes, which are so ornamental for the conservatory, and for the garden or shrubbery, where the climate will allow of their standing outside. Messrs. Ant. Roozen sent me six varieties, some gold and some silver striped, and others with purple or green foliage. Both they and all the other things they sent me, such as Eulalias, Libertias, Yuccas, Bamboos, Lilium giganteum, &c., throve amazingly; but the Phormiums, though they grew in bulk year by year, showed no signs of blooming till this last May, when two of them suddenly began to throw up flower-spikes.

Perhaps I may be wrong in flattering myself that no other Phormiums have ever bloomed quite as far north as mine, and I am well aware that they are as nothing in comparison to the giants which are to be found somewhat further south, at Loch Hourn Head, where I hear my friend, Mr. Birkbeck, had one clump with fourteen spikes on it this year. All this blooming of Phormiums I put down to the intense heat of 1893. And so it was with the common Hydrangeas; they hardly flowered with me in 1893, but their wood having been so well ripened, they bloomed far and away better this year than I ever saw Hydrangeas bloom in Scotland, with the exception of a few I once came across on the west side of Mull; some of the heads were as large and very nearly as blue as if they had grown on the shores of Como or Maggiore.

Another effect of the heat of 1893 was the wonderful way it ripened seeds of every kind; and if we had only taken the trouble to collect them, we might have been quite independent of the foreign seed farms of Germany, &c. I daresay my readers will hardly credit me when I say, that we had blue Lobelias and Heliotropes coming up broadcast in our borders this season; and as to Dahlia, Tigridia, Alonsoa, and Schizanthus seedlings, they came up like weeds! In the case of Dahlias, my gardener, noticing last year how well their seed had ripened, wisely saved some of it from the best varieties of my collection, which is a very full one; and it was, perhaps, one of the most successful attempts we ever made in flower-raising. The Dahlia seed was sown in slight heat in March and planted out in May, and by July we had what I might call hedges of Dahlias of from 4 to 5 feet high, smothered with the most lovely blooms of every conceivable tint, mostly single flowered, with some double and semi-double among them; one of them, a crimson-and-white Cactus, my gardener, Mr. Campbell, has named after my daughter. To show what a perfect success the seedling Dahlias were, I may mention that though one row of them faced a border containing a treble row of the very best named varieties, it would be hard to say which were the best, those grown from the home-saved seed, or those grown from bought tubers.

Once more, I must tell of the effect of the heat of 1893. For the last three or four years I have been trying to grow the American Bramble, "Wilson Junior," in my garden, but it was such a failure that early last spring I ordered my gardener to grub them all up and consign them to the rubbish-heap; but he very prudently took time to consider, and soon thereafter we noticed that they were going to blossom profusely, and the blooms seemed extraordinarily large and healthy-looking. The next thing they did was to set, and in good time to ripen their fruits, and they made us open our eyes quite as wide as did the Phormiums. Their fruit was perfectly beautiful; honestly speaking, they were fully an inch long, and not only jet-black, but covered with such a strong coat of varnish or gloss that they sparkled and glittered in the sun; and how good they were to eat, being as nearly as possible like the best of South of England Mulberries, when they fall of their own accord from sheer ripeness on the green sward below their branches. The "Wilson Junior" ripened about the end of July, and in October we had an excellent crop of Blackberries on the cut-leaved or Hungarian Brambles, which were nearly twice the size of the native Scottish, and hung in such beautiful black clusters, like the Brambles one sees in the hedgerows of Normandy and Brittany; but the Hungarians could not for a moment be compared to the Americans, which, had I been able to show them at a fruit exhibition, would have drawn a crowd round them from morning till night.

And now, before ceasing to give instances of the good effects of the hot summer of 1893, I will tell of a Lilium giganteum, which had been in the garden for several years, and which did wonders in the way of blooming this last June. What a truly tropical plant it looked as it stood there, just as its forefathers had done in their native valleys of Nepaul. It was quite 8 feet high, with fifteen big flowers on its top, and with every one of its great glossy leaves as perfect as if grown under glass. And, lastly, I must not forget to mention the blooming of the Watsonias, which, though quite hardy to stand our coldest winters here, are shy about blooming, unless emboldened to do so by an extra long spell of sunshine the previous year. One of the Watsonia flowering stems was nearly 5° feet high, and the individual blooms, which hung loosely at intervals of about 4 inches all up the stalk, were reddish-orange in colour, somewhat tubular, and unlike any of the Gladiolus tribe, which its leaves so resemble.

For some years I have rather despised annuals. I trust I am gaining wisdom as I grow older, and now despise nothing that helps to make my garden bright and beautiful. I find that many plants that we used to grow as perennials, and that had to be wintered under glass, can now be grown as annuals at half the cost and trouble, as, for instance, the Dahlias already mentioned; also Salvias, Lobelias, Alonsoas, and Carnations. Others, again, take the place of bedding-plants, and far exceed them for beauty. We used to grow Gazania splendens with

some trouble as to wintering, and with only very moderate success in the way of blooms. Seeing it grow and blow as I saw it do abroad, I lost all heart in attempting any longer to grow it here; but lo and behold, a kind friend recommended to me an annual Venidium calendulaceum, from South Africa; and I now get, at the cost of 3*d*, nearly as good a blaze of orange as delighted my eyes when looking at the edging of Gazania round the English chapel at Ajaccio in Corsica, and which for dazzling brilliancy beats anything I ever saw before.

But I have not yet done with my annuals. When in Switzerland some years ago, I was so struck with the beauty of the beds of single Dianthus sinensis, which I came across in the gardens of some of the big hotels, that this year I got the seed of more than one variety of this plant from Erfurt. It came up, grew admirably, and the plants have given us the greatest pleasure; their dwarf habit and hardiness were so suitable to this country, and the immense size, that the wonderful colours and shapes of their blooms quite fascinated us.

Besides these, there are all the Scabiouses and Gaillardias, and the hardy Verbena venosa, and the two handsome creepers, the Eccremocarpus and the Loasa, all of which we have bloomed from seed sown in the spring. I have forgotten to mention the Salpiglossis, and those who do not already know these plants should certainly try them. The tints and mixtures of colour in these annuals are quite unique, and hardly to be matched in the flower-world; but they seem a little delicate, and want a good soil and situation. Zinnias and Portulacas went against me this year; but I hope to master the art of growing them one of these days. My gardener, being encouraged by the success of his border of choice plants last year, arranged a large oval-shaped bed this spring. It was composed of partly hardy things, such as Yuccas, Eulalias, Fan Palms, Crinums, Eucalyptus, Callas, Bamboos, and Cannas, &c., which will all stand our winter pretty well without, or with at most very slight, protection. To these he added in the spring or early summer, Castor-oil plants, variegated Maize, Melianthus major, and Cosmos bipinnata, which were all raised from seed in a frame in the spring; and, certainly, to look at them in October it was difficult to believe that they were only six or seven months old. This bed would, I think, have been hard to beat anywhere, and looked none the worse for being backed by a high wall, covered with vertical cordons of Plum and Pear, which were bearing as heavy a crop of fruit from their highest tops to their lowest twigs as they could well carry. The Cosmos were quite new to us. They grow from 3 to 4 feet high, with pretty feathery foliage, their flowers resembling a small single Dahlia, colours dark purple, light mauve, and pure white, and with a bright yellow disk in the centre. I consider them very well worth growing. I think I have already spoken of Carnations as annuals, but I ought perhaps to have distinguished them as the Marguerite Carnations, for they are quite a new strain. So good were they with us this year, that we might almost have dispensed with the more costly and troublesome named varieties of Carnations and Picotees. Of course, being from seed, they do not all come double, though the larger proportion of them do so, and their beauty and delicacy of colour cannot fail to make them popular. Early sowing in a little heat is all they seem to want. And now to come back to perennials. I was much struck lately by our Brugmansias, and I do not fancy that many in the North use them as a bedding plant. The fault of them is that their long orange-scarlet blooms are so heavy as to weigh the plants down to the ground, but I hope to obviate this by planting them another year against my terrace wall. This year the Diplacus, or tree Mimuluses, had a beautiful effect trained against the wall among flowering Myrtles and Ceanothus, and they caught the eye of every visitor to the garden, and were immensely admired. I would especially commend the dark mahogany-coloured one, both for indoors and out of doors, and its shade of colour is so peculiar as to be almost unknown among flowers. I may mention that they are very nearly hardy. The Abutilons suit also very well for wall-covering, and do quite well out of doors here for six months of the year. Achilles ptarmica, the Pearl, and Galega alba are both sure to find favour with the ladies. I have been much interested in what has been to us quite a new plant. Its name is Stokesia cyanea; it is very dwarf, with blue flowers like a large China Aster. It has an individuality about it which is sure to commend itself to all lovers of flowers. Hearing it was not hardy, we wintered the young plants that we got last year in a cold frame, and when planted out they bloomed profusely.

Agapanthus umbellatus is perfectly hardy here without any protection, and blooms regularly. Do any of my readers know the Purple-leaved Birch? It does not do well with me, but as it does well elsewhere, I would advise all lovers of beautiful foliage to get it. The Japanese Maples are among the foliage plants which I intend getting, and they are, of course, the very pink of perfection in this line. A clump of American Dogwood has been very brilliant here this autumn, and its bright crimson twigs are most beautiful all through the winter, after its rosy leaves are gone. And how is it that most people are satisfied to have all their berries red? Red seems certainly the favourite colour among the berries themselves, but I think a variety is desirable, and for yellow or rather orange, nothing that I have ever seen in berries can match a really good mass of Sea Buckthorns, with its silvery foliage almost hidden by its fruit. I have a round bush of it just now, which stands out boldly at the top of my lawn, like a globe of amber against its background of dark evergreens.

O. H. Mackenzie, Inverewe, Poolewe.

SOME NEW DEVELOPMENTS OF VEGETABLE PRODUCTS.

Fresh applications for old-established products are frequently cropping up in the commercial world, the origin of which is in some cases but little suspected, except by experts or by the introducers themselves. Thus, for instance, the large consump- of Arrowroot in this country at the present time by Cocoa and Chocolate makers, who use it to produce a thickened beverage so well-known in the cheaper preparations of Cocoa and Chocolate, is a case in point; another instance, and a very interesting one, is the adaptation of late years of vegetable fibres and barks in the manufacture of ladies' hats.

For many years past the spring and summer headgear of ladies, both in England and on the Continent, have been of the lightest possible description. Cotton-thread being, perhaps, one of the materials most generally used, and this has been worked into all sorts of fancy devices, and dyed in every colour and shade. Straw, of course, has always been used more or less, but of late years even this well-known material has been so varied in the designs of plaiting, and split and twisted into such fine threads as to be scarcely recognisable as straw; moreover, this material, which was formerly an English and Italian industry, is now imported in the form of straw braid in large quantities from China.

Always alert for novelties, not only in design but also in material, those who are engaged in this trade have of late years laid under contribution numerous other vegetable products, such as the roffia or raffia, so much used at the present time by gardeners for tying-up plants. This substance, which is the cuticle of the leaf of the Madagascar Palm, Raphia ruffia, is much used by the people in Madagascar for weaving into cloths for articles of dress, being split very finely, and dyed of various colours, and often worked into excellent patterns—an industry that is shared by the natives of west tropical Africa in utilising the leaf of their own Vine or Bamboo Palm (Raphia vinifera). Considering the strength, tenacity, and softness of the threads made from the twisted leaf-strips of these Palms, it is somewhat surprising that this material has not been adopted before for European manufactures, but for some years past the common Raffia has been dexterously plaited and formed into ladies' hats, though the bulk of the wearers have no doubt been quite innocent of the material which formed their head-gear; and the gardener's tying substance, which has now become a thing of antiquity, namely Cuba bast, the inner bark of Hisbicus elatus, which in years past was familiar not only to gardeners, but also to cigar merchants, being much used to tie up bundles of Cuba cigars, has also found a new use, having been pressed into the service of the milliners after being bleached, or dyed black, or any of the favourite fashionable colours, and when so treated, and twisted or plaited, it forms an exceedingly light and lace-like material. Baobab bark from Adansonia digitata is another substance that has been introduced. The natural colour of this bark is a dull brown, and it is heavy, and, moreover, it is somewhat rough in appearance, and consequently has not found much favour, notwithstanding that it has been bleached a pure white, so that Baobab bark is not likely to be much used. So completely altered are some of the materials, that in their manufactured forms it is difficult, if not impossible, even for an expert to determine their botanical origin; notably amongst this class are Sisal and Manilla Hemps. The first, as is well-known, is the fibre of Agave rigida var. Sisalana, a fibre that has attracted a good deal of attention of late for rope and cordage-making; the single fibres of this plant, as well as those of the Manilla Hemp (Musa textilis), are placed side by side, and united by means of gelatine into a flat ribbon or tape-like form of varying widths, according to the pattern to be worked with it. When so united, edge to edge, they are submitted to very heavy pressure, which not only produces a very thin material like flattened straw, but a remarkable gloss is imparted to it by means of the pressure. The varieties of design in which these Sisal and Manilla plaits are prepared are infinite, and these substances appear to have taken a firm hold on the market, as there is a very great demand for them, not only in this country, but also in France, Germany, and Switzerland. Split Willow-wood, under the name of "chip," which was much used some thirty or forty years ago for hats and bonnets, and which for many years had almost died out, is being again largely used, bleached to a pure white or dyed in various colours, and plaited either alone or mixed with Cuba or bast or other substances; in short, there seems to be no limit to the application of vegetable products for milinery purposes, and a careful inspection of the contents of a shop window may at any time lead to the detection of some new development.

VARIORUM.

Weather on the Riviera.—The bright and genial spring, the hot and rainless summer—remarks our correspondent at Cannes—have been succeeded by an autumn which, from a horticultural point of of view, has been most unfavourable. The spring was far above the average in temperature, and from May 23 to the end of September no rain fell, the average rainfall being below 12 inches. The autumn, at least the month of November, has been below the average temperature. Snow has fallen in the eastern Riviera, thermometer below freezing point, and biting east winds sweeping down from the snow-capped mountains remind one more of a northern March than the bright and sunny weather which is usually experienced at this time of the year.

Cocoa-nuts and Brazil-nuts.—While many people are eating Cocoa-nuts and Brazil-nuts this season, they may like to know some interesting facts which Dr. Morris has brought to light in connection with those articles. He has been telling a London audience that though the Cocoa-nut has to all appearances only one cell, in the flower the ovary contains three cells, two of which are suppressed in the process of growth. But anyone can see that the outer shell is in three divisions, and that there are always three eyes, two of which are "blind." In the walls of the two divisions of the shell in

which the blind eyes are placed, are to be found the suppressed embryos. A three-celled nut has recently been presented to the Kew Museum; apparently no one knows of another in existence. It does not often fall to the lot of the lover of Cocoa-nuts, to find a beautiful pearl inside one instead of milk; but such cases have occurred. These pearls are white, and resemble oyster pearls, in being composed almost wholly of carbonate of lime. They are worth looking for. As for Brazil-nuts, Dr. Morris said they were really only seeds, about sixteen of which at a time are found enclosed in a large shell. And of this shell a curious fact was related. It has one very small hole in it, and when the seeds germinate, the first to sprout through this hole into the open air, prevents the others making further progress; in fact, it kills and lives on them. It is only in this way that the plant can survive in the struggle for existence. This is quite a tragedy in plant life; and when we next crack a Brazil-nut we may remember that it represents the successful competitor in a family dispute as to the survival of the fittest. *Birmingham Gazette.*

LAW NOTE.

AT the Middlesex County Sessions, on Nov. 24, William Kemp, gardener, of South Norwood, age 34, was indicted for obtaining by false pretences divers sums of money from his employer, Mr. Alexander, of Teddington, and goods from Messrs. Protheroe & Morris, of Cheapside, and Messrs. John Laing & Sons, of Forest Hill. The jury found the prisoner guilty, and Mr. Loveland-Loveland sentenced him to twelve months' hard-labour.

Obituary.

MR. HENRY BIRCH.—We regret to announce the death of this widely-known and highly esteemed gardener, who died suddenly of apoplexy, on his return from Northampton to Castle Ashby, on Tuesday, November 27. The deceased, who was forty years of age, began his gardening career with his father at Hatherop Castle, subsequently being placed in the gardens at Sandringham. He filled the situation of foreman in the gardens at Croxteth Park, was head-gardener at Waddesdon, Aylesbury, and for the past eleven years has held the head place in the gardens of the Marquis of Northampton at Castle Ashby, Northamptonshire. A widow and two children survive him.

MARKETS.

COVENT GARDEN, December 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

SEEDS.

LONDON: *December* 5.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market was thinly attended, but with little business passing. American cables quote Red again higher. White Clover-seed in London continues extremely sick, and now shows a substantial drop from recent top-values. Trefoil keeps steady, with rather more doing in it. Canadian Alsyke is 1*s.* higher. Rye-grasses dull. Scarlet Runners are strong, at the late advance. Giant Haricots keep firm. Canary-seed in Liverpool is reported rather easier. No change in Hempseed. Mustard and Rapeseed are steady. Blue Peas meet a slow sale.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *December* 4.—Quotations:—Cabbages, 1*s.* 6*d.* to 2*s.* 6*d* ; Savoys, 1*s.* 6*d.* to 2*s.* 6*d.* per tally; Cauliflowers, 1*s.* to 1*s.* 6*d.* per dozen; Sprouts, 9*d.* to 1*s.* per half sieve; Horseradish, 1*s.* 2*d.* per bundle; Turnips, 1*s.* 3*d.* to 2*s.*; Carrots, 1*s.* 9*d.* to 2*s.*; Parsley, 1*s.* 6*d.*; and Greens, 2*s.* to 2*s.* 6*d.* per dozen bunches; Celery, 4*s.* to 7*s.* per dozen bundles; Onions, English, 2*s.* to 2*s.* 9*d.* per cwt.; foreign do., 1*s.* 9*d.* to 2*s.* per bag; Apples, English, 3*s.* to 9*s.* per bushel; do., Canadian, 8*s.* to 18*s.* per barrel; Pears, 2*s.* to 4*s.* 6*d.* per bushel, and 2*s.* to 14*s.* per case.

STRATFORD: *December* 5.—The supply to this market during the past week has been excellent, and with a large attendance a good trade was done at the prices shown below: Cabbages, 2*s.* to 2*s.* 6*d.* per tally; Savoys, 2*s.* to 3*s.* do.; Greens, 1*s.* to 1*s.* 3*d.* per dozen bunches; Cauliflowers, 1*s.* to 1*s.* 3*d.* per dozen; do., 5*s.* to 6*s.* per tally; Turnips, 1*s.* 6*d.* to 2*s.* per dozen bunches; do., 30*s.* to 40*s.* per ton; Carrots, household, 24*s.* to 32*s.* do.; do., cattle-feeding, 14*s.* to 26*s.* do.; Parsnips, 50*s.* to 60*s.* do.; Mangels, 15*s.* to 17*s.* do.; Swedes, 14*s.* to 18*s.* do.; Onions, English, 50*s.* to 60*s.* do.; do., Dutch, 40*s.* to 60*s.* do.; Apples, English, 3*s.* to 5*s.* per bushel; do., American, 12*s.* to 14*s.* per barrel.

FARRINGDON: *December* 6.—Quotations:—Artichokes, 2*s.* per bushel; Greens, bunch, 1*s.* to 1*s.* 3*d.*; Savoys, 2*s.* 6*d.* to 3*s.*; Collards, 1*s.* 3*d.* to 1*s.* 6*d.* per tally; Celery, 6*s.* to 7*s.* per dozen; Onions, Valencia, 4*s.* 6*d.* to 5*s.* per case; Belgian, do, 2*s.* 6*d.* per cwt.; English, do., best, 3*s.* to 3*s.* 6*d.* do.; Apples, English cooking, 3*s.* 6*d.* to 4*s.* per bushel; Canadian, 17*s.* to 18*s.* per barrel; Pears, 4*s.* per case; Pine-apples, 2*s.* 6*d.* to 4*s.* 6*d.* each; Chestnuts, 14*s.* per bag of 50 kilos.; Tomatos, Canary, 5*s.* per box; Oranges, 12*s.* to 13*s.* do.; Celery, 8*s.* to 0*s.* per dozen; Horseradish, 1*s.* to 1*s.* 1*d.* per bundle.

POTATOS.

BOROUGH AND SPITALFIELDS: *December* 4.—Quotations ranged from 60*s.* to 110*s.* per ton.

STRATFORD: *December* 3.—Quotations:—Magnums, Darklands, 55*s.* to 60*s.*; do. Light-lands, 60*s.* to 80*s.*; Scotch do., 70*s.* to 80*s.* per ton.

FARRINGDON: *December* 6.—Quotations:—Reading Giants, 70*s.* to 80*s.*; Magnums, 65*s.* to 80*s.*; Bruces, 65*s.* to 75*s.*; Sutton's Abundance, 70*s.* to 80*s.*; Stourbridge Glory, 65*s.* to 70*s.*; Hebrons, 65*s.* to 75*s.* per ton.

LONDON AVERAGES: *December* 5.—Main Crops, 80*s.* to 100*s.*; Snowdrops, 80*s.* to 90*s.*; Magnums, 70*s.* to 90*s.*; Kidneys, 60*s.* to 70*s.*; Blacklands, 55*s.* to 65*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 126*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 6[illegible]*s.* to 105*s.*; do., inferior, 36*s.* to 80*s.*; mixture, 90*s.* to 105*s.*; and straw, 22*s.* to 36*s.* per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending December 1, and for the corresponding period in the previous year:—1894: Wheat, 20*s.* 7*d.*; Barley, 22*s.*; Oats, 14*s.* 3*d.*, 1893: Wheat, 27*s.*; Barley, 28*s.* 8*d.*; Oats, 18*s.* 3*d.*

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature: Above (+) or below (−) the Mean for the week ending December 1.	Temperature: Accumulated: Above 42°, for the Week.	Temperature: Accumulated: Below 42°, for the Week.	Temperature: Accumulated: Above 42°, difference from Mean since January 1, 1894.	Temperature: Accumulated: Below 42°, difference from Mean since January 1, 1894.	Rainfall: More (+) or less (−) than Mean for the Week.	Rainfall: No. of Rainy Days since Jan. 1, 1894.	Rainfall: Total Fall since Jan. 1, 1894.	Bright Sun.: Percentage of possible Duration for the Week.	Bright Sun.: Percentage of possible Duration since Jan. 1, 1894.

*	1 —	29	0	+ 317	− 28	9 —	201	36·1	21	42

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 1, is furnished from the Meteorological Office:—

"The *weather* during this period was very dry over the entire Kingdom; a good deal of mist and fog prevailed in most places, but a fair amount of sunshine was recorded in the north-eastern, and also at many of the southern and south-western stations.

"The *temperature* was a little below the mean in 'England, S. and S.W.,' in 'Ireland, S.,' and the 'Channel Islands,' and just equalled it in the 'Midland Counties,' but in all other districts it was above the normal, the excess in 'Scotland, N.' being 4°. The highest of the maxima were recorded, as a rule, on December 29, and varied from 59° in 'Scotland, W.' and 54° in 'Scotland, E.,' and 'Ireland, S.,' to 49° in 'England, S.' The lowest of the minima occurred on Nov. 25 in 'Scotland,' and on Dec. 1 in 'England' and 'Ireland.' They ranged from 22° in 'England, S.W.' and 23° in 'Scotland, E.,' to 31° in 'Scotland, N.,' and to 35° in the 'Channel Islands.'

"The *rainfall* was, with the exception of some of our extreme northern and north-western stations, almost entirely absent.

"The *bright sunshine* varied a great deal in different parts of the Kingdom, but was, as a whole, above the mean for the time of the year. The percentage of possible duration ranged from 37 in 'England, N.E.,' and 35 in 'Ireland, S.,' to 15 in 'England, E.,' 12 in 'Scotland, W.,' and 8 in 'Scotland, N.' In London (owing chiefly to fog and mist), the amount was very small, the percentage of the possible duration being only 6, while in Manchester and its vicinity none whatever was registered."

Trade Notice.

We are informed by Messrs. Fromow & Sons, Sutton Court Nurseries, Chiswick, W., that Mason's Nurseries, Windlesham, Bagshot, have been purchased by them, and that they intend working the nurseries in connection with their nurseries at Chiswick and Hounslow.

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** Plants, Fruits, etc., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

A Correction: Gardening appointment. In our last issue, Shottisfont should have been printed Mottisfont.

A Species of Rose of a Pink Colour: Name of sender mislaid. Rosa microphylla rubra.

Chrysanthemums, Eupatorium, Salvias, &c.: *R. P.* The injury to the leaves is due to the fumes thrown off by hot-water pipes painted with paint having turpentine in it, from the use of some kind of insecticide, or from excessive fumigation with Tobacco-paper, &c. Can the fumes from the boiler-fire find ingress to the greenhouse? There is no fungus.

Cyclamen Flowering: *Cyclamen, Folkestone.* Plants can be got of good size, with plenty of flower, in about one year, under warm treatment.

Grape packing for Transit by Railway: *A. B. C.* Line a basket, having sloping sides, with cotton-wool or soft moss, about 1 inch thick; cover this with tissue-paper, and lay the bunches shoulders upwards, separated by a small space, fixing the stalks with a stout tack, or with twine, and securing them also in one or two more places with soft-spun yarn or bast. Sloping boards, placed securely in oblong hampers, answer as well if similarly lined. Packing the bunches firmly in large punnets or small square boxes, holding about 4 lb. of fruit, merely lining the sides as before, is a good way if the passenger takes them into the carriage, and looks after them.

Imported Orchids: *H. D B.* The methods of treatment of these plants when they arrive from abroad are various. The chief point to observe is not to put them into any kind of compost before new roots or new growth in old roots are apparent. Some cultivators hang the plants up by the heels in a moderately warm, moist house, under the stages, but not too near the hot-water pipes, syringing them several times a day; others place them in new (because absorbent of water) pots, loosely filling clean crocks about them—no moss or soil—syringing as before. When it can be seen which is sound tissue and which is not, the decayed parts may be cut away. Always retain sound and not hopelessly withered pseudobulbs, even though they be leafless.

Names of Fruits: *C. H. T., Isle of Wight.* Pear Ne Plus Meuris.—*F. World.* Winter Crassane.

Names of Plants: *W. T., Hea Moor.* Æschynanthus grandiflorus.—*T. R., Subscriber.* 1, Trichomanes Luschnathianum; 2, probably a young state of No. 1; 3, Gleichenia dichotoma.—*F. G. W.* 1, Mammillaria pusilla; 2, Euphorbia globosa; 3, Rhipsalis saglionis; 4, Dyckia rariflora; 5, Mammillaria gracilis; 6, Cereus sp.; 7, Aloe humilis; 8, Gasteria verrucosa; 9, Senecio (Kleinia) chordifolia; 10, Opuntia microdasys. Another time do not send more than six specimens.—*W. S. L.* Leycesteria formosa.—*G. F.* 4, Adiantum decorum; 5, Selaginella Wildenovii; 6, Adiantum concinnum latum; 7, A. tenerum; 8, A. capillus veneris variety; 9, A. hispidulum.—*W. W., Aberfeldy.* The Orchid sent is Cœlogyne Rossiana.—*P. A. S. F.* 1, Echeveria secunda glauca; 2, some sub-tropical plant used for bedding. Send when in flower.—*Q. R.* 1, Carpinus Betulus (Hornbeam); 2, Forsythia suspensa, probably; send again when in flower.—*C. Steel.* 1, Fomes annosus, Fr.; 2, Trametes mollis, Fr.; 3, too fragmentary; 4, Stereum rugosum, Fr. *M. C. C.*—*J. A.* 1, Hypericum Moserianum; 2, Euonymus japonicus; 3, Tamarix gallica: 4, Salvia involucrata; 5, Lonicera sp.; 6, Cotoneaster frigida.—*W. H. M.* Cotoneaster bacillaris.

Peach Shoot: *F. L.* We have not seen the shoots alluded to, but we think your practice is correct. We shall be glad to know the results of your experiments in due time.

Pears: *J. H. A.* Fruit quite rotten on arrival, and cannot be named.

Rating Glass-houses of a Market Grower: *Vicaria.* The rating should be at one-fourth value, not the full rateable value. See Purser *v.* Worthing Local Board, a report of which case appeared in the *Gardeners' Chronicle*, March 26, 1887; a suit which was decided in favour of the grower, the judgment being upheld on appeal, see *Gardeners' Chronicle*, May 21, same year.

Roses: *Roslin,* The border in which the plants are being narrow, you might leave the strongest of the shoots of considerable length, and fasten them down to within 9 inches of the ground by means of hooked pegs or simple straight pegs, making them fast to these with tarred string or Willow twigs, the weak flowerless shoots bring cut clean away, and shoots of medium strength shortened to 6 to 8 inches. Each year some of the older shoots must be cut away, their place being supplied by young strong shoots as before. Simply to prune your Roses hard will not keep them within the desired limits, and may result in still stronger growth. A partial pruning, that is just topping the shoots, may be performed at this season; the chief pruning taking place as soon as signs of growth are noticed in March, or if the spring be cold and backward, even in April.

Violets: *A. B. C.* We cannot say; a fungus (rust), probably. Kindly send specimens for examination; meantime, dusting flowers-of-sulphur on the lower sides of the foliage.

Vines: *Foreman.* The removal of the rough bark from Vines causes no injury whatever, if care be exercised, and the live bark beneath this be not scraped or wounded with the implement used. This outer bark is dead, and the protection it might afford a Vine out-of-doors is not required by a Vine indoors; moreover, it supplies a hiding place for insects.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 80 per cent., and that it is increasing weekly.

Advertisers are reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and that it is preserved for reference in all the principal Libraries.*

CONDITIONS OF SALE.—Goods are offered subject to being on hand on receipt of reply. Cash to accompany all orders, and prices are to be strictly *net*. All orders will be executed in rotation, and carefully packed and put on rail, except those otherwise stated.

P.O.O. payable at 794, Old Kent Road; Cheques crossed "L and S. W. Bank."

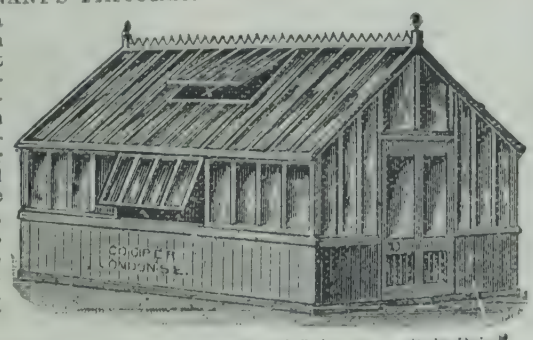
GREENHOUSE DEPARTMENT.

THE AMATEUR FORCING-HOUSE.

TENANT'S FIXTURE (SPAN-ROOF).

These Houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a House for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance; it being a structure constantly in request, but almost hitherto unknown.



Specification.—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim-lock and brass-fittings, in one end; glass 16-oz. throughout, English-cut. Ventilators supplied, according to size of House, and stays necessary for opening same; stages for plants each side of House, all wood work painted one coat of good oil-paint, and the whole structure securely packed and placed on rail.

SPAN-ROOF VILLA CONSERVATORIES.

Adaptable for the lawn of a villa-residence, being well and substantially built, constructed of the best materials, and artistically finished with diagonal panels and bargeboards. The framework is composed of 2in. by 3½in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The houses are fitted with a half-glass door, complete with rim-lock, brass-fittings, and key, and is supplied with lattice staging for each side, footpath the entire length; gutters, down-pipes, suitable ventilators, and necessary ironwork for opening same. All woodwork painted two coats of good oil-paint, glass cut to sizes, and all parts securely packed on rail. Prices:—

NEST BOXES.

LOTS 1197 to 1411.

This is a popular method of sitting hens, and should be universally adopted. The bottom is of wire-netting, made concave, so that no eggs are left uncovered by the hen; it is also a protection against rats burrowing into the nest. These boxes are constructed of thoroughly well-seasoned tongued and grooved match-boards, painted outside one coat of good oil-paint, complete with handle. Size, 1 ft 8 in. high, 1 ft. 4 in. wide 1 ft. 3 in. deep. Securely packed and put on rail at the following respective prices:—

HEATING APPARATUS DEPARTMENT.

COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove,—and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems.

• See LIST for full description.

THE RAPID PROPAGATOR.

The only Perfect Propagator for Raising Plants from Seeds, Slips, or Cuttings.

This Propagator is the best and cheapest now before the public, and will be found especially serviceable to Amateurs and Gardeners who require to strike cuttings and raise seeds in a short space of time.

One of the Propagators will raise large quantities of plants in the spring, thus, to a great extent, dispensing with the necessity of striking cuttings in the autumn; it being well-known that many cuttings fall victims to the frost and damp atmosphere so prevalent in this country. This method of propagating saves the trouble and annoyance resulting from the loss of so many plants in the winter time, and also makes it unnecessary to occupy so much space in storing a large quantity of cuttings.

These propagators are composed of an outside casing, with movable sheets of glass on top. The bed or bottom is formed of a tank, in which a constant circulation of Hot-water is kept up by the Heater (See Illustration), the pots being plunged in a bed of Cocoa-nut fibre refuse, which should be kept moist. It is heated by oil, one pint of which will burn at least 30 hours. Securely packed (no charge for packing), and put on rails complete, at the following sizes and prices:—

Special Quotations for Truck Loads, F.O.R.

2863—COOPER'S SUNSHADE.

SUPERSEDES ALL OTHER PREPARATIONS OF THE KIND.
The cheapest, most efficient, and convenient preparation for Shading Greenhouses, Conservatories, Glass Roofs, and Windows of all descriptions. Is applied cold—an enormous advantage over preparations requiring to be used whilst hot. May be used either inside or outside, and produces a pleasing effect. Is not washed off by rain, but can be instantly removed when desired by rubbing over with a brush whilst it is wet. Made in various colours—White, Pale Blue, and Pale Green.
Usual Prices, in tins: 1 lb, 1*s.*; 2 lbs, 2*s.*; 7 lbs, 5*s.*
Sale Prices: 1 lb., 4*d.*; 2 lbs., 8*d*; 7 lbs., 2*s*

2864—COOPER'S

WONDERFUL NEW MUSHROOM SPAWN.

From many years' experience I believe this brand of Spawn to be the very best procurable—fresh; very best quality, producing abundant Crops of Superior fleshy Mushrooms.
Usual Price: 4*s.* per bushel.
Sale Price: 2*s.* per bushel.

Moistens in Heat. Holds Heat in Winter, Invaluable for Potting, Planting, Forcing, Decorating, and used on **Strawberry Beds** is preferable to straw keeping the Fruit clear from grit, and at the same time nourishing the Plants. For lightening heavy soils it is particularly useful, and when the soil is light and dry it is of great advantage as a mulch. All slugs and insects are destroyed by its use.

LOT 2868—SPECIAL OFFER TO THE TRADE.

100 Tins Sunshade and 100 Tins Fertilizers, to retail, at 4*d.* and 6*d.* each. 35*s.* on rail.

CARPENTER JOINER, well up in General work.—W. C., 20, Droop Street, Harrow Road, N.W.

A PATHETIC INCIDENT recently occurred in the London streets. It was late, and a poor little girl was trying in vain to sell her violets. Suddenly a boy, a typical London Arab, who had just sold his last evening paper, and was rattling his ha'pence in his pocket, stopped before her. Taking the situation in at a glance, he said kindly, "I'll buy yer vi'lets. Come on, we'll sell 'em tergether." The boy evidently was a good salesman, for we passed barely an hour later, and the children were running about together, with only two or three bunches left. We can all help one another if we like. The sick and suffering we can save if we only point out to them the healing virtues of HOLLOWAY'S PILLS and OINTMENT.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

FOR RAISING WATER for the SUPPLY of TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, FARMS, &c.

RICHARD SMITH & Co. WORCESTER

CHRYSANTHEMUMS.

Our Varieties and Stock are unapproached.

This is well known by the oldest and most successful growers. As an instance, Mr. Mease and many others are again victorious in the great class with those we supplied last season. This unprecedented prize-winning has continued, with hardly a break, for many years. Vigorous and healthy cutting stock is our specialty, not prizes, &c. We have prepared the finest houses (Come and See), of cut-down un-forced plants months ago, which are now full of the loveliest soft root-cuttings, grown near the glass, ever seen, and will strike at once (while others linger for months), and will certainly ensure success wherever they go.

Send for our CATALOGUE, describing 1000 New and Old Varieties—the best kept Collection in England.

IMPORTANT ANNOUNCEMENT.

AMERICAN NOVELTIES for 1895.

HILL AND CO.,

RICHMOND, U.S.A.,

Beg to inform their English and Continental Patrons that they have disposed of a large portion of the Stock of their entire set of Novelties for 1895, to

Mr. W. J. GODFREY, of EXMOUTH,

who has the sole right of distribution in Europe.

W. J. GODFREY

has pleasure in announcing the arrival of a fine lot of plants of the above Novelties.

At some considerable expense many of the plants were sent with blooms, thereby giving to W. J. G. an opportunity to judge of their properties, and he is much gratified at being able to announce that the blooms arrived in sufficiently good condition to allow him to offer the varieties with great confidence.

Fully described in CATALOGUE, which will be published shortly.

W. J. GODFREY,

THE NURSERIES, EXMOUTH, DEVON.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 15, 1894.

A CHRYSANTHEMUM EXHIBITION IN JAPAN.

WE are standing where several gravel paths meet (in the gardens of the Imperial Palace at Yeddo), and round about us are erected numerous light-looking bamboo structures, covered and draped with silk crape of a soft violet tint (the imperial colour, as purple formerly was in the West); all over these lilac hangings are dotted white heraldic Chrysanthemums, spreading out their large, strange-looking petals.

It is the flower-show. Beneath these awnings and imperial silks are collections of Chrysanthemums — real Chrysanthemums, although they hardly look so; Chrysanthemums of marvellous growths, to see which we have been invited by their Imperial Majesties; Chrysanthemums of a very astonishing kind, of which nothing we have at home can give you any idea. They are planted V-shape, thus—V V V, in symmetrical regularity on sloping beds of mould, covered with a smooth and extremely fine moss. Each plant has only one stalk, and each stalk only one flower—but what a flower!—larger even than our largest Sunflowers, and yet of such exquisite colour, of such singular form! Here is one with large, solid-looking petals, so compactly arranged, that you would say it was a large pink Artichoke; the next one to it is of a russet-bronze colour, and looks like a large curled Cabbage. There is another one of the most dazzling yellow, with hundreds of long, thin, shaggy petals, shooting forth and falling over like a sheaf of golden thread. There, too, are some of ivory-white, palish mauve, and rich-looking amaranth, with many others variegated, shaded, and double-coloured. We bear in mind, too, the infinite pains which the cultivation of these flowers must have cost when we approach more closely and examine their almost invisible supports running up the entire length of the stalk, and spreading out under the leaves, propping up those which are too heavy, or squeezing and keeping back the sap of those showing a tendency to develop too quickly.

The little fairy-like creatures in their long, humming-bird gowns, are examining the exhibits with us; but they wear a look of pre-occupied condescension. As the heat becomes more intense, they agitate, and constantly open and shut their court fans—certainly the largest in the world—on the silk folds of which are painted the vaguest, scarcely-suggestible of dreams—little sea-scapes, reflections of clouds on water, winter moons, shadowy flights of birds, or, perhaps, showers of Peach-blossoms wafted by the breese through April mist. A very large, tinselled tassel is fastened to the base of the fan with

long threads of shaded silk hanging down to the ground, and sweeping the fine gravel as the wearer fans herself.

We are advised, however, not to linger here, but to go further on and see still more lovely flowers, and walk up yonder slope, where the Empress will presently come and sit with us for a few moments. So we walk along a shady path, between a row of giant Cedars stretching over our heads and a rather dismal, isolated pond full of Lotus. The Cedars are very old and covered with moss, and their long branches spread out very low, even touching the grass. You would think that this spot was entirely wild, for here is a Rice-plantation, the same which, according to an old tradition, the Mikado is every year obliged to cut with his own hands, at harvest time.

Along the top of the upland is a flower-garden, one mass of pink Chrysanthemums. From here we catch glimpses of the woody park all round; the spot is delightfully quiet, and here we completely ignore the existence of the noisy town, with its *fêtes* and din of gongs clanging in every direction.

On either side of the flower-garden, underneath the same high, light-looking structures, and the same lilac-hued hangings, dotted with white flowers, we find more floral exhibits, more phantasies in Chrysanthemums, cultivated by different means, and under still more extraordinary secrecy. These here are like made-up bouquets, similar to those you see in vases on our church altars, only of such enormous dimensions, almost like trees. The plants possess at least a hundred stalks each, arranged in perfectly symmetrical order, a central stem, and at the end of each stalk is a flower in full bloom, neither over-blown nor half-opened, but just at the height of its ephemeral glory. Before the day is over, probably all of them, the fruit of so much labour, will fade away and die.

Attached to each flower is a paper label, with its name written in those learned characters which are intelligible in two distinct languages —Chinese as well as Japanese. They are called by such names as—The Ten-thousand-times-dipped-in-gold, Mountain Vapours, Autumn Mist, Kissed-by-the-Sunset, &c. *From the French of Pierre Loti.*

New or Noteworthy Plants.

Betula alba japonica.

A Japanese variety of the common Birch, with greenish-bronze stems, studded over with whitish specks or knubbles, which make it quite rough to the touch, especially in the young state; the petioles are rosy-red, and also lenticillate, and the leaves twice as large as those of B. alba, are heart-shaped at the base, and ending in a point, deeply indented and waved at the edges, and in colour dark dull green. This tree grows in the island of Yezo, and is very rare.

Betula Maximowiczii.

In Yezo, Japan, this tree grows to a height of over 80 feet (25 mètres), and measures over 3 feet (1 mètre) across the base of the stem. The bark, smooth to the touch, bronzy-orange in colour, thickening at the base of old trees, peeling off in long narrow scales, and turning to an ashen-grey colour, the leaves widely oval, cordate at the base, toothed, thin, and almost membranous, are bright dark green above, and yellowish-green below, larger than those of any other Birch, sometimes measuring as much as 5¾ inches (15 cents. long).

Diervilla (Weigela) præcox.

A Japanese species, soon growing to over 5 feet (1·60 m.) high, resembling W. amabilis in foliage, the branches straight,; stems rounded; internodes long, glabrous and brown; leaves acuminate-oval, finely toothed, very hairy on both surfaces, especially the lower one, very soft to touch, and bright clear green. The axillary flower-buds bear two pairs of opposite leaves, and from ten to fifteen large flowers in horizontal or slightly pendent trusses. The flower-tube rather more than 1 inch (3 cents.) long, and widening gradually, is rose-carmine, with a carmine base; the lobes rounded, half-open, are of a beautiful tender rosy-mauve, and the throat marked with a yellow band edged with carmine. This tree comes into bloom some weeks before other species of Weigela. *Extracted from M. V. Lemoine's Plant Catalogue.*

Cattleya guttata Prinzii, "Viscount de Figueiredo," new var.

Of the thousands of what is known in gardens as Cattleya amethystoglossa, which have flowered under cultivation in Europe, this may safely be called the most beautiful and extraordinary, so far as comparison with publicly-exhibited varieties or those met with in collections are concerned. C. guttata Prinzii is one of the most variable of the genus in the size of its flowers, some forms being scarcely worth cultivating on account of their small and imperfectly-expanded blooms. In the matter of colour the variation is slight, the ground colour of the sepals and petals invariably having some shade of pink or blush-white. In this new form there is no trace of such colour, the ground-colour being distinctly yellow. The flowers, which are wax-like and well expanded, are about 4 inches across, the petals being over an inch wide. The sepals and petals are creamy-yellow, the reverse sides lemon colour, and both sepals and petals are spotted with rich amethyst-purple. The side lobes of the lip are cream coloured outside, and chrome yellow inside, about half an inch of the tips being of a deep crimson purple. The broad corrugated front lobe of the lip is also deep crimson-purple. The column is pale yellow with a purple blotch at the tip, and a similar purple mark on the lower edge on each side. Everything in this beautiful variety seems to harmonise, each feature heightening the attraction of the others. It was sent from Rio de Janeiro by the Viscount de Figueiredo to the Right Hon. Lord Rothschild, in whose collection at Tring Park it has just flowered, and at whose request it is named in honour of the sender. *James O'Brien.*

Winter Treatment of Tender Alpines.

I often receive from England enquiries respecting the proper winter treatment of tender species of alpine plants, such as Eritrichium nanum, Androsaces, certain Primulas, and Gentians, and more particularly those of the genus Artemisia. As a matter of fact, species from very high mountainous regions, and more particularly those which grow in the fissures of rocks and in gravelly moraines, are not only difficult to acclimatise, but in winter their treatment is an extremely delicate matter. We have for some time past made, in the Jardin d'Acclimatation, some useful observations on this subject, and the result of them I will now communicate to the readers of this journal.

It is needful, first of all, that the plants be thoroughly acclimatised—that is to say, not transported direct to the plains from the mountains, their natural habitat. The new roots thrown out in their different position must become sufficiently numerous and vigorous to act regularly, and permit the plant (this must not be forgotten) to remain nearly dormant during the winter, and protect it against the humidity of soil and air.

It is known that at high elevations plants grow rapidly. The intense light, the duration of which is longer than in the plains, the rarity and lightness of the air, increase the vigour both of respiration and transpiration in plants as in animals. The cells of alpine plants are so constructed that they readily lend themselves to this more rapid life.

Sachs, in his 13th and 14th *Vorlesungen*,* shows us what are the functions, utility, and conditions of transpiration in plants. Transpiration is necessary to the growth and well-being of the plant. The water which enters the plant by means of the roots, leaves by the stomata, but is not then of the same composition as on entering, as it yields to the tissues of the plant through which it passes all the mineral substances it held in solution, and these substances conduce to the development and growth of the plant.

Now transpiration, so necessary to species growing at high elevations which have but a little time in which to complete their annual existence, can only be affected under certain conditions. Thus it is necessary that the roots be in a perfect state and so well constituted as to act easily. This is a primary condition. To obtain such a result it is necessary to have plants well established before August; that is, if they are to be transplanted from the mountains to gardens, it must be done in early summer. Moreover, we have proved in the Jardin d'Acclimatation, that for tufted species and those in close rosettes such as Eritrichium, Androsace glacialis, Helvetica, Charpentieri, pubescens, pyrenaica, cylindrica, argentea, &c., it is better to completely change the soil round the clump, and to treat the specimens exactly as young plants just pricked out; that is, to keep them under glass until the soil is full of roots. This much facilitates the transplantation, as it is not necessary to bring away earth with the plant; but it is needful to preserve as many of the roots as possible when pulling them up. The best mode of growth is clearly that from seed, as thus more compact, sturdy, and acclimatised clumps are obtained, and these better resist damp dark winters which so often kill plants brought directly from the mountains.

Many English clients assure me that plants sent by us when raised from seed, succeed better and stand the winter better even when small and apparantly feeble than do those transplanted directly from the mountains. Evidently all depends on the root-system, which, being better constituted, acts more freely and rapidly.

Growers should cover their plants with a bell-glass, as that will help them. If their roots are not vigorous, you cannot save them. This, then, is the principal thing to do. The proverbial dampness of the English climate is prejudicial to Alpines in winter only; in summer it is very favourable to them. In the Alps in winter these plants are covered with a thick layer of snow. They suffer from no excess either of heat or cold, and continue to respire feebly, to live slowly, but not to develop their foliaceous organs. In an English fog, with no snow, in a temperature almost always above freezing point, the plants from high summits have difficulty in surviving the winter. The air is saturated with dampness, and evaporation and transpiration of which I spoke above, are conducted under difficulty, as transpiration takes place most fully when the air is more or less dry. Hardy plants do not suffer; besides, most of them do not continue growing as alpines do, which start into activity at the least degree of heat: half a degree (C.) is sufficient to promote the growth of the foliaceous organs of alpine plants.

But, while plants from low altitudes easily withstand an excess of damp in their tissues, it is not so with certain alpines. They grow in a weakly way, and water distends all their tissues without evaporating. They then become more tender, weak, and susceptible to damp, and rot easily.

A due state of equilibrium is needed between the dampness of the soil and that of the air before transpiration can ensue. That is to say, the air must be drier than the soil; it must be capable of producing evaporation so that the functions of transpiration—that is, that the transport through the vessels of the plants of water from the soil into the air—may be easily effected. This is difficult to ensure in winter if the atmosphere is charged with damp. It is better to let the plant suffer from the contrary excess of drought; it then suffers, but does not rot as it does from damp, but remains intact, and in the first days of

* *Vorlesungen über Pflanzen-Physiologie Von Julius Sachs*, Leipsig, 1887.

spring recoups itself by growing all the more rapidly. When, then, these plants are grown in pots, they can be kept under cover and dry. But it is otherwise with those in the open air, and exposed to all the extremes of climate.

We have proved that such plants as I have named above resist the damp even of the air best when planted in sand or sandy soil. We have also found that those placed on the upper part of the rock or wall survive longer than those close to the soil, to the damp earth, whence is constantly exhaled a prejudicial vapour. It is a good plan to cover them with a glass. It is also very important to keep the sides of the clump on pieces of rock or brick, to raise them from the soil, that the air may circulate between the clump and the earth, to prevent the plant rotting. It should be added, that the more the plant can enjoy the sun's rays, the more it can be exposed to full light, and in a dry place, the better it will be.

I have placed in a bed very near the glass, and in a very dry place, all such species as Eritrichium nanum, all species of Androsace, Artemisia glacialis, spicata, Villarsi, mutellinum, Senecio leucophyllus, Amphoricarpus Neumayeri, Campanula cenisia, Elatines, Blatinoides, Allionii, alpina, Zoyzii, Viola cenisia, &c.

I have kept them dry, and hardly watered them at all during the winter; they looked miserable and suffered from drought, but I kept them alive. Absorption through the roots did not occur, or only very slightly, the foliaceous organs were not loaded with water, and if the damp air did not allow evaporation, it did not, on the other hand, take any hold on the plant, the tissues of which were not saturated with water. So, if rot occurs, it is because there is too much moisture in the inner as well as in the outer tissues, and if evaporation does not occur the plant dies very rapidly. Now, our plants are kept quite dry in winter, only receiving water two or three times from the beginning of November to the end of February; once exposed to the beneficent rain of early spring, they start into life and succeed admirably.

In fact, to enable delicate alpine plants to survive the winter, it is necessary to ensure—1, a good, healthy clump of roots, produced under acclimatisation. 2. Equilibrium, as far as possible, between the damp of the soil and that of the air, so as to promote absorption and transpiration. 3. It is preferable that the plant should suffer from drought rather than from the contrary excess, and in this case watering should be suspended during winter, and the plants should be kept dry. If they can be put under glass, then you must—and this is in every case an advantage—provide them with a sandy or barren soil, and plant them as high up as possible on the rock or wall. *H. Correvon, Jardin Alpin d'Acclimatation, Geneva.*

HYBRID ORCHIDS.

Those of us who have been working amongst Orchids for the past thirty years, cannot but note with feelings of pleasure the great changes that have taken place in what we may call the *personnel* of this family of plants. Week after week new garden varieties of quaint forms and marvellous beauty are being figured in the gardening press, and if we may express wonder along with our admiration, it is that we have been so long in heartily taking up the cross-breeding of these plants. For many years the late Mr. Dominy, in Messrs. Veitch's nursery, had the field almost to himself until Mr. Seden took to it in earnest. Not so long ago, the annual flowering of Cattleya exoniensis × used to be chronicled as an event of the week. Now beautiful new Cattleyas, Lælias, and some bi-generic hybrids, appear in regular sequence, and owing to their numbers, they do not lay hold upon the horticultural mind so much as might be expected.

Those who would become acquainted with the work done in the crossing-breeding since Mr. Dominy's efforts in the Exeter nurseries of Messrs. Veitch in 1853, would do well to consult the *Manual of Orchidaceous Plants*, published by Messrs. J. Veitch & Sons of Chelsea, in which an excellent paper bearing fully upon this subject, headed "Some Results of the Hybridisation of Orchids," will be found. The first step is very easy, i.e., the production of seed-pods. After the pollen-masses have become glued to the stigmatic part of the flower, which is placed at the front and near the top of the column, underneath the anther, fertilisation proceeds rapidly, and in twenty-four hours the flower begins to collapse, and the column to swell. The seed-pods speedily grow to their full size, but months elapse before the seed is ripe. At that period the capsule changes to the colour of maturity, and opens longitudinally, scattering the seed, which is like dust in smallness. Amateurs and gardeners complain of the long time which elapses before seedling plants flower. It does take a long time; in some instances nineteen years have been mentioned as the maximum period of waiting and watching. But those who talk or write in this strain assume that there is no pleasure in watching the development of the seed-pods, the germination of the seedlings, or the yearly progress of the plants to the flowering stage. I quite admit that the flowering of the plants is a red-letter day in the calendar, but the pleasures of anticipation must assuredly be counted, and those who will not begin interesting work of this kind because the end is a long way off, cannot be classed amongst the enthusiasts of Orchid culture. There is one point in which the results of the cross-fertilisation of Orchids differs from that of florists' flowers and some other productions of the garden, inasmuch as one may predict almost to a certainty what the flowers of Orchid seedlings will be like. They are generally the exact intermediate form and colour of the parents; sometimes the characteristics of the pollen-bearer predominating, as in the splendid Cypripedium × James H. Veitch, raised by Messrs. James Veitch & Sons, by crossing C. Curtisi with the pollen of C. Stonei platytænium, the form of the petals not resembling in any respect those of C. Curtisi, but in the form of the flower and the numerous spots it resembles C. Stonei platytænium, and it is like this fine variety in the length of its petals. The colour of C. Curtisi has also, to a considerable extent, become transfused in the spots. Both the dorsal and lower sepals have a resemblance to those of C. Curtisi. Seedling Orchids cost but little to raise, and there is not much expenditure of time. When the capsules ripen, cut them off and lay them on clean white paper to dry. Some of the seed will fall out upon the paper, the rest will become loose in the capsule; all of it can be shaken out, and put upon the surface of the pots or baskets in which other Orchids are growing. There it will in time germinate, and during this process it is very interesting to watch the development of the plants from the smallest of imaginable seeds. The small plants have a tendency to disappear, I fancy, because the roots do not form rapidly at first; considerable progress taking place in the development of the leaves before roots are formed. It takes about twelve months before the seedlings can be said to have an independent existence by the root or roots catching hold of the fibrous peat and sphagnum-moss. Many small seedlings are smothered by the growth of the sphagnum-moss, and by their being overshadowed by the leaves or pseudobulbs of the plants under which the seeds are growing. Very small flower-pots (thimbles) may be used to pot off the small Orchids, and so that not much of a check is given to growth at the first, they are placed closely together in a large flower-pot, pan, or Teak-basket, and partially filled with drainage material, upon which the small pots are placed, some chopped-up live sphagnum-moss being placed in the spaces between them. In twelve months, less or more, the seedlings will require to be re-potted, some of them having increased in size, whilst others have remained stationary. With care in watering and ventilation, and in keeping the young plants free from thrips, which do much injury to them, they soon put forth strong growths; and it depends a great deal on the subsequent treatment as to what time may elapse before the plants flower. The great thing is not to afford too much pot-room, or allow the compost to become sour. *J. Douglas.*

THE SEED TRADE.

(Continued from p. 594.)

The Pea: Its History and Uses.—Although authorities affirm that the true origin of the Pea has been lost in obscurity, certain it is that several kinds were largely grown by the Egyptians, the Greeks, and the Romans. Its introduction into this country is somewhat mysterious, some of our old time writers stating that it came from France, others from Holland, and there is no doubt it found its way to Britain through these countries, becoming acclimatised according to local surroundings.

It was not until the reign of Henry the Eighth that we learn of its cultivation in gardens, and one of the first to give instructions on the point was Tusser, the curious poetical writer, who advises in his calendar of operations for January:—

"Dig garden, stroy Mallow, now may be at ease,
And sette (as a daintie) thy runcival pease."

and for the month of February he adds:—

"Sticke plentie of bowes, among runcival Pease,
To clamber thereon, and branche at their ease."

Gerard, in Queen Elizabeth's time, writes:—"That Pease do growe in pastures and earable fields belonging unto Bishop Hatfielde in Hartfordshire." He describes "the garden and field Peas, the tufted or Scottish Pea, and the Peas without skin in the pods." Coles, in his history of plants, about the same date, says: "The Fulham Pease, which came first out of France, is so called because the grounds about Fulham neere London doe bring them forward soonest." There is no doubt the common white and grey round Peas were cultivated in all directions during the next century, careful growers selecting and improving their stocks as opportunities offered. Nothing, however, appears to have been known of artificial hybridization or cross-breeding; indeed, such a point in association with plants had not been discovered, and we have to reach the latter part of the eighteenth century before we hear of attempts made in crossing the Pea.

These experiments, probably the most important to record in connection with this vegetable, were conducted by Thomas Andrew Knight, the enlightened President of the Horticultural Society in its early days. Following some successful investigations he had made into the fecundation of other plants, it seems that in the season of 1787 he came across a degenerate kind of Pea growing in his garden at Chelsea [?], and he operated upon its blossoms with a grey Pea, with the result that the progeny grew in great luxuriance, and gave pods of such an improved character, that he was quite convinced the influence of the artificial impregnation was effective. Persisting in his endeavours for several years, he was enabled to produce the kinds known as Knight's Tall Green Marrow, and Knight's Dwarf Green Marrow, two varieties that have been the progenitors of all our popular wrinkled marrow-fat Peas, and they are still to be found in many seedsmen's lists. No sooner were these novelties launched upon the world, than numerous so-called new sorts followed in all directions, that great confusion took place in regard to distinctive properties, and about 1845 the Horticultural Society were obliged to undertake a series of trials with the intention, as the report goes, "to reduce the discordant nomenclature of the seedshops to something like order; to enable the gardener to know the quality of the sorts he desires to cultivate, and above all to prevent his buying the same kind under different names." The result of their tests was the means of reducing over one hundred different names to about twenty. From this date, through the introduction and rapid development of improved means of communication a perfect revolution took place in the general conduct of business. Sellers sprang up in all directions, each cataloguing his own special kinds, with the result that once again Peas, in common

with other vegetables, obtained their names in never ending variety, some from imaginary qualities, some from the peculiar mode of culture, others from more fanciful distinctions, hence in 1860 the Fruit and Vegetable Committee of the Royal Horticultural Society felt it necessary to make another extensive trial which brought out a deal of instructive information, as also did their subsequent investigations in 1872.

It must not be inferred from these remarks that there were no introductions of merit put upon the market during the interval, for we have only to name the "British Queen," a fine variety raised by Cormack, the great Lewisham grower, and "Champion of England" which came out through the instrumentality of Fairbeard, an important market-gardener in Camberwell, whilst that superb late marrow, the "Ne Plus Ultra," supposed to be the result of a cross between the two aforesaid varieties, and originally distributed by Brownless of Berkhamsted, is well known to everybody as one of the most reliable standard Peas of the present day.

The work so cleverly initiated by Mr. Knight was taken up by other skilful operators, with the result that we now possess many important varieties greatly in advance of many of the earlier days. Notable in this category we may name Dr. McLean of Colchester, whose introductions have acquired world-wide fame, and several of his Peas still stand in the front rank, these fine improvements were mostly distributed by Mr. C. Turner of Slough. Mr. Thomas Laxton, whose decease at Bedford was chronicled only last year, followed next, taking as a base for his experiments many of Dr. McLean's introductions; his endeavours seem to have been directed chiefly towards gaining in earliness, increase of size, and filling of the pod, and to keeping the height within moderate bounds, and we are sure no one will grudge this skilful hybridiser the honours he deserves in this respect, for it will be many years before some of his productions will go out of cultivation. Mr. Henry Eckford of Wem, an indefatigable novelty raiser of Sweet Pea fame, is also responsible for many choice culinary kinds; but few seem to have taken the public fancy as yet—it is whispered that he has some grand sorts in training which may cause a commotion when ready for the market. In connection with the large-podded Peas, to no one more than Mr. W. Culverwell, the popular gardener at Thorpe Perrow, Bedale, does the exhibiting and market-growing community, owe greater gratitude for the introduction of that fine Pea, Telegraph, which may be fairly called the forerunner of nearly all the giant-podded section now so popular.

The Seed Pea Trade.

How very few seedsmen have any idea of the extent to which the Pea is cultivated. Beyond the fact that they distribute so many bushels each season, their knowledge is nil. In our own country the area put under this crop is enormous. The estimates made by the Government of the total British acreage during the present season are put down at 243,551 acres, or 33,400 more than in 1893; taking the produce of this area to be 4,871,020 bushels, allowing for a return of 20 bushels to the acre, which is under the average, compared with the results of the past five years, we find the quantity of seed required to sow this breadth of land at the rate of 3 bushels per acre, gives a total of 730,653 bushels of seed, which has to be supplied from one source and another; and if we put down the price charged at an all-round average of 12*s.* per bushel, and this is exceedingly low for the season (we are obliged to include the common blue Peas, and also the feeding varieties), we get a grand total of £433,392 vested in this commodity alone as a home-grown crop, and which it must be noted has no affinity to the enormous quantities imported each season.

The following table shows the estimated total produce, the acreage, and the average yield per acre in the United Kingdom for the past five years, and we have also added the acreage out this season, from which it will be gathered that there is a larger proportion than usual, although the preliminary returns just issued may possibly include those crops picked green, which really have no place in our investigations:—

Years.	Bushels.	Acres.	Yield per Acre, in bushels.
1889	5,921,107	225,431	26¼
1890	6,312,910	219,903	28¾
1891	5,777,445	204,631	28¼
1892	5,028,494	194,517	25¾
1893	4,756,447	210,395	22½
1894	.....	243,551	...

The following tables dissect the acreage figures representing this season into counties, from which the seedsman can readily ascertain the quantity of land under this crop in his own district:—

Seedsman.

(To be continued.)

Orchid Notes and Gleanings.

A SINGULAR CATTLEYA.

A flower of a very curious Cattleya has been sent by Messrs. Linden, l'Horticulture Internationale, with the information that the plant which bore it was sent from Venezuela with a quantity of Cattleya Mossiæ. In appearance it is near to C. Warscewiczii (gigas), but the flower which is smaller than in that species has white sepals and petals, and rather narrow plain-edged labellum, with a deep cleft at the apex. The front of the lip is purple, the sides, which fold over the column, blush white, with rose-purple lines. Messrs. Linden say, "Long ago we heard of a white Cattleya with a purple lip in this district. May it not be that we are on the way to import it?" *J. O'B.*

Cattleya × Hardyana Leopold II.

This fine new variety is making a great sensation among Belgian orchidists, and those who have seen it in this country speak highly of it. A faded flower sent by Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, indicates in some degree its beauty when fresh. The sepals and petals are white, and the lip of that intense velvety purplish-crimson and rich yellow so well known in all forms of C. × Hardyana. It is the nearest to "the peerless white gigas," as it is now generally called, Cattleya Warscewiczii Countess of Derby, which is in the possession of T. Statter, Esq., Stand Hall, Whitefield, Manchester, who has exhibited the plant at the Royal Horticultural Society's meetings on two or three occasions this year. *J. O'B.*

Dendrobium Phalænopsis Schroderianum.

A splendid form of this noble Orchid is now in flower with Walter Cobb, Esq., Dulcote, Tunbridge Wells (gr., Mr. Howe); it is of the "delicatum" section, and bears white flowers suffused with light rose-purple, but its fine form and great size are its more remarkable features. The flowers are 3½ inches across, and each petal is 2 inches wide. Mr. Cobb grows the species well, affording them abundance of light and moisture when growing, and a warm atmosphere and even regular temperature, the latter being considered of more importance than great heat. *J. O'B.*

Cattleya Bowringeana.

This species is undoubtedly one of the best autumn-flowering Orchids which we possess. The plant thrives in a mixture of peat and sphagnum-moss, in which broken potsherds are mixed with a liberal hand. It should be planted in shallow baskets, and afforded an abundance of water during the growth. The best place for it is the Cattleya-house. In this house, hung up near to the roof, at the present time I have some plants with twelve flowers on a single growth, a number which I think is above the average. *Herbert May, Markree Castle Gardens, Collooney, Ireland.*

Chondrorhyncha Chestertoni.

This singular species, which seems to flower at intervals during the greater part of the year, is now in bloom in Lord Rothschild's gardens, Tring Park. Its large pale straw-coloured flowers with crimson spots at the base of the curiously-fringed labellum are very attractive, and make a pleasing contrast with the soft-green leaves. Beside it is the true Stenia pallida of similar growth, and with pretty pale yellow flowers with very singular Stanhopea-like fleshy labellum. The plant known as Stenia fimbriata is evidently a Chondrorhyncha, for its creamy-yellow flowers very closely resemble those of Chondrorhyncha Chestertoni. They form a very singular and pretty section of Orchids, but which are unfortunately always rare. *J. O'B.*

REINWARDTIA TETRAGYNA.

For many years Reinwardtia (Linum) trigyna has been an inmate of our stoves and warm-houses, and being a plant of easy culture, flowering late in the year, it was at one time pretty generally cultivated, its floriferous habit and bright yellow flowers making it useful for decorative purposes. The subject of our illustration (fig. 90) flowers at the same season; its flowers, which are larger, are of the same colour, but the number of them in a corymb is greater, and the leaves, as will be observed, differ in size, form, and disposition from those of R. trigyna. A plant, excellently flowered, was shown by Sir Trevor Lawrence at the Royal Horticultural Society's meeting on November 27. (See *Gardeners' Chronicle*, December 1, p. 669.)

GREENHOUSE HARD-WOODED PLANTS.

(Continued from p. 533.)

Pleroma.—The genus Pleroma contains undoubtedly the finest of all the Melastomaceous plants in general cultivation. Most of the species require stove or intermediate-house treatment, but in Pleroma elegans we have an easily-managed greenhouse plant, much neglected at the present day it is true, but none the less extremely handsome when in flower, its season of blooming extending from July to September. It does not flower freely as a small plant, but as a half-specimen or a specimen it is very floriferous, producing a distinct feature amongst greenhouse plants at a season when really good things among hard-wooded plants are none too plentiful. Its large, rich, blue flowers are fully three inches across upon vigorous specimens, the terminal bloom always being a trifle the largest, several lateral ones being also produced in succession. Starting with a young plant of P. elegans, it will be better to pinch the shoots, principally the leaders, for a season or two, so as to secure a dwarfer and better-proportioned plant. If this item of culture be overlooked, a few of the stronger shoots will take the lead, and a leggy plant will be the ultimate

result. By frequent stopping and regulating the shoots, drawing them outwards to prevent overcrowding, it is quite easy to overcome this disposition to increase too rapidly in height. Mr. Ward, a well-known exhibitor, has shown this Pleroma in first-rate condition during July, notably at the Royal Botanic Gardens, Regent's Park. I have myself staged it 4 feet through, and about the same in height, in August and September. When a plant grows too tall, it may be pruned hard back to the base after being allowed to become dusty-dry at the root so as to guard against excessive bleeding. The best time to do this is after flowering. I took a plant in hand once that was already so pruned. In order to encourage it to break afresh and as kindly as possible, I put it in a pit with Pine suckers until the spring following. I had thus a good base upon which to build up the specimen again. During the ensuing summer that plant was kept out-of-doors in the full sunshine; thus the growth was well matured, and the plant prepared to stand through the following winter in the greenhouse. This species, although a native of the Organ Mountains in Brazil, is much safer on the whole in a greenhouse than even in what is usually termed a temperate-house. A rather damp position suits it best; if too dry, there is the risk of an attack of thrips or spider. It should also be kept well out of the influence of cold draughts, keen cutting winds, &c., otherwise the edges of the leaves will turn brown. It is not a plant that needs in any degree to be overpotted, its roots are fine and fibrous. By guarding against this it is always possible to water more freely during the summer and with greater safety, for at that season it enjoys a good supply, the syringe being used also in hot weather. Fibrous peat such as will suit Ericas is the best soil to select, with a liberal use of silver sand; should the peat be rather more soft and spongy, it may be modified by the use of a little yellow loam. Firm potting is most desirable, and liberal drainage should be provided. Cuttings of the half-ripened wood will strike kindly under bell-glasses in an intermediate temperature. Whilst quite small and comparatively tender, a little warmth over and above that of the average greenhouse would be most desirable. At no period would I advise manurial applications to be indulged in. If anything be used as a stimulant, nothing will be safer than a weak solution of soot-water.

P. macrantha (syn. Lasiandra macrantha), is not strictly speaking a cool greenhouse plant. It will thrive well in a warm greenhouse or in an intermediate-house, between which there is not much difference. It delights in a moist atmosphere; with this I was once particularly struck by seeing how well it was thriving in one of the larger ferneries at Messrs. Backhouse & Sons, York, where the Ferns were simply luxuriating. At Kew I noted it only recently in the large show-house, with less moisture as a matter of course, yet it was thriving in the best possible manner. In both instances the plants were trained up the roofs, this being by far the better system to adopt, for in spite of stopping, the growths will extend upwards. Flowering as it does during October and November, this species is a decided acquisition. If a suitable position can be given it, I would advise that it be planted out, but not in too much soil. P. macrantha floribunda is a dwarfer form of the species with larger flowers, and like it, is a handsome plant, being more profuse in blooming. In both instances the colour is a deep violet or purplish-blue. Soil, &c., as for Pleroma elegans.

Fig. 90.—Reinwardtia tetragyna: greenhouse winter-flowering shrub. Flowers yellow. (see p. 720.)

Monachætum.

This genus is also of the Melastomaceæ, but a cool greenhouse is scarcely the place for them to thrive well. Where the last-named species of Pleroma can be grown, there these will thrive, and under the treatment in other respects as given for P. elegans. I used to grow M. ensiferum, which is about the best species for cultivation, in a stove kept at a moderate

*

temperature. It is very profuse in flowering during the late autumn and winter. M. Lemonianum is a form of the preceding, flowering somewhat later or towards the spring; in colour it is a deep rosy-pink shaded violet, the shading not being so discernible in M. ensiferum. The species of this genus are of much dwarfer and compact habit than the Pleroma. *James Hudson.*

(To be continued.)

NURSERY NOTES.

MR. G. MAY'S NURSERY.

Eucharis grandiflora at Teddington.—As a flower for market purposes, few can boast of a more widespread popularity than the Eucharis. Thus it is that their cultivation occupies a very large share of attention in the nurseries of Mr. George May, at Upper Teddington, where may be seen tens of thousands of plants in the finest possible health, and the greatest luxuriance. At the present time and for some weeks past, a considerable portion of this gigantic stock has been yielding its harvest of blossoms. At the time of our visit (in the early days of November), the stock in flower was in some three spacious span-roofed houses, each about 80 feet long and 20 feet wide. One of these was on the wane, yet still carrying quantities of flowers; but the forest of flower-stems bore ample evidence of the wealth of flowers they had borne. A second house was just expanding its earliest blooms; while a third, somewhat later, had the scapes nearly fully grown. Apart from these, there were other plants occupying a range of glass upwards of 300 feet in length, in three divisions, with successional batches in three stages; the latest of these had the spikes just emerging above the soil, others were a few inches high, and another batch had the scapes well above the foliage. Mr. May's chief aim has been to provide a continuous daily supply all the year round; and his efforts have been crowned with success. I spent some little time in an endeavour to estimate the number of spikes in each house. As nearly as could be determined, this was about 3500, or a total of 10,500 spikes in the three houses now in bearing. Each spike bears from five to seven flowers, and at the time of my visit some 270 dozen blooms were already packed for market, a number that could easily have been doubled had the necessity arisen. The gathering and packing, being of daily occurrence, is done systematically. It is worthy of note that this enormous stock has been worked up through a series of years, and from quite a small beginning. The stock throughout is typical of high-class culture. Individually the flowers are large, and of very firm texture, a property of no small importance in the market. Too frequently the flowers as seen are thin and flimsy, being devoid of substance, while the segments have a tendency to cup. These deficiencies are no doubt largely due to cultural errors or unhealthy stocks, and not unfrequently are the result of excessively high temperatures.

The system of culture adopted at Upper Teddington is simple enough. Abundance of hot-water piping is present in each house, and this is kept at a steady uniform temperature. The very large pot system finds no favour; the bulk of this giant stock being grown in 8-inch and 9-inch pots, with a few in somewhat larger size. The soil used is principally loam, and this rather rough. Indeed, fine soil in the culture of Eucharis should be avoided, as it lies close, and is apt to become sodden quickly. Ample drainage is an absolute necessity. Great care should always be exercised with the watering-pot, as indiscreet watering is responsible for much mischief; in certain stages, in fact, very little water is needed at the root; while in a general way, atmospheric moisture in the growing season is abundantly maintained. Even overhead syringing has its drawbacks, on account of the channelled nature of the leaf and stalk, the water by this means being easily and quickly conveyed to the bulb. The greater portion of the plants are grown on open wooden stages, as the heat uniformly distributed through the house obtains ready access to the plants from below. In the culture of this plant alone some dozen or more large houses are devoted, thus making the Eucharis one of the features of the establishment. With justifiable pride, Mr. May declares this grand stock to be absolutely free from insect pests, and certainly their health and general appearance warrant the assertion. Even in this gigantic stock there is little departure from the type in the flower, but in one or two cases the segments, as well as the fructifying organs appear in duplicate. *J.*

Japanese Plants at Coombe Wood Nurseries.

On a plot of ground surrounded by hedges of moderate height, with an aspect and somewhat rapid slope towards the south-east, was planted soon after their introduction by John Gould Veitch from Japan, quite a collection of deciduous trees and shrubs. After the years that have elapsed since their introduction, several of these have reached quite tree-like size, having survived in safety the very varied winters and springs to which this country is subject, thus affording sufficient indication of their hardihood. The following are of particular interest, and should be noted for their distinctive features:—

Clerodendron trichotomum has possibly been looked upon with some suspicion as to its hardihood by reason of its generic name. The plant in question is now of large dimensions, being of quite tree-like habit. Last year with the additional advantage of the hot weather late in the summer, it produced a plentiful crop of berries which in October were an extra attraction. This plant is some 12 feet or more in height and as much in width, flowering every year in September very profusely. It is of a vigorous constitution and free growth, forming a fitting companion plant to, although of dwarfer habit than Catalpa syringæflora, with foliage of similar shape, but smaller. Some quarters of it in the open nursery are thriving unusually well, having this season made strong growths. The flowers are white, with a purplish calyx, having the additional advantage of a delightful fragrance; the berries are blue, of a similar shade to that of the flowers of Plumbago capensis—it produces berries in most seasons. It was originally introduced in 1800, but until brought into greater prominence at Coombe Wood, it does not appear to have attracted much attention. It may be safely relied on beyond a doubt in all but the most exposed and coldest of situations.

Cæsalpinia japonica, at the first glance, somewhat resembles an Acacia, but it is on closer inspection found to be quite distinct. It has large bi-pinnate leaves, light green in colour, being very elegant, and of most pleasing appearance. At Coombe Wood it is planted in the open ground, and has escaped injury during severe winters. Its flowers are yellow, being produced in long racemes. When inspecting it last autumn the idea suggested itself that it would prove an excellent wall plant; with this object in view I planted it last autumn, and the growth this year has been most satisfactory. As a wall plant it is most distinct. The wood is densely armed with sharp prickles, not unlike a Bramble, and quite as formidable.

Styrax japonica.—This shrub has flowered most profusely during the past summer, its fragrant white blossoms making it a decided acquisition during May. It is of erect and sturdy growth, not disposed to make long sappy shoots. By reason of its compact habit, it is a shrub that will need scarcely any pruning. At the present time, the large plant of it is well covered with berries, although several have been removed for the sake of the seed. The foliage is comparatively small, and of a deep green colour. The effect at the present time when standing under the branches is remarkably good. I see no reason why it should not force well.

Lindera cæsia.—Just at the time of inspection this plant (or plants) was in its full autumnal tint, the foliage being of a bright golden-yellow, and exceedingly effective. The growth is erect, and the leaves about the size and form of those of Rhus Cotinus, the habit of the plant being very compact. For colour-effect at this season, it should prove of essential service. It is known popularly as the Silk-tree.

Carpinus cordata.—This form of the Hornbeam is particularly attractive by reason of its Hop-like clusters of fruit or seeds; these are about the size of fully-developed Hops, and singularly like them in appearance. The growth is hard and wiry-looking.

Clethra canescens.—This plant promises to be a welcome addition to its class. It is of dwarf growth, with linear foliage and long drooping spikes of white flowers. As a plant, it should be in the open ground what C. arborea is in the greenhouse, a most desirable acquisition.

Acer palmatum sanguineum.—This form of the Japanese Maple was at the time of my visit in the height of its brilliant tints, which, for intensity of colouring, could scarcely be exceeded. I noted some fine masses of it, which are presumably old propagating stools. These are planted just outside of the hedges alluded to upon a sloping bank, being thus an apt illustration of planting that might be advantageously adopted.

Taxodium distichum (dwarf form).—This plant appears to be quite the miniature of the deciduous Cypress. As a dwarf and compact-growing variety, this should eventually prove to be of signal service as an ornamental Conifer.

In this interesting collection there are several other things which might be noticed. The growth of those already noted would, no doubt, have been in some instances in excess of what it is, as propagation must in a measure interfere with a free development. *H. G.*

St. Bridget Anemones at the Blackpill Nurseries, Swansea.

I was very much struck, when calling at these well-known nurseries on November 28, to find a large number of these useful plants in full bloom, reminding me of May and June rather than the end of last month. Considering the great variety of colours, and the ease with which they can be grown, it is a matter of surprise to find these flowers seldom met with in private gardens, and especially where cut flowers are in much request, the blooms being invaluable when removed from the plants. I noticed a fine breadth of ground planted with seedling Anemones of this variety some 30 yards long by 12 wide, and containing many thousands of plants which were raised from seed sown about the beginning of July this year. Besides these, there are two long borders of 400 feet by 6 feet, entirely filled with fine healthy plants, which when in full bloom next season will be worth seeing. *R. Milner, Penrice Castle.*

A TRAVELLER'S NOTES.

(*Concluded from p.* 659.)

Wellington, N.Z., *July* 11, 1893.—For twenty-five years Mr. T. Mason, of Taita, Wellington, has been forming a garden of more than ordinary interest; because, what is there growing, shows how many fine plants an English climate just misses. A bed of light sandy loam, of a depth varying from 8 to 11 feet, rests on gravel, affording drainage to the ample rainfall. It may be safely observed that almost every hardy plant known to English gardeners will succeed, and succeed well, in such a spot under such conditions; in addition to which, the mildness of the winter permits many known to us as too tender for the open ground to flourish and make fine specimens.

The Tasmanian Blue Gum (Eucalyptus globulus) assumes the proportions of a forest tree, as does the Western Australian Jarrah (E. marginata). To native trees and shrubs Mr. Mason has not devoted so much attention; possibly because the horticultural value of the major part of the New Zealand flora is distanced by that of other countries. The collection of Abies is large, and the specimens, almost without exception, literally perfect. Few are more than 25 feet, but all are clothed to the ground, massive pyramids—massive, as the rate of growth has evidently been rather slow than otherwise.

Picea orientalis, Abies Pindrow, A. nobilis, A. pectinata, A. Nordmanniana (35 feet, not a branch visible so dense is the foliage), A. balsamea, A.

Mertensiana (28 feet, a most elegant species), Picea Morinda (a conical mass of drooping lateral branchlets and stiff, upright young shoots), A. Pinsapo, A. Webbiana, A. amabilis, Picea polita (15 feet), A. Douglasii, A. lasiocarpa (3 feet), A. Veitchii (2 feet), the two last named but just planted, and A. bracteata particularly fine, are amongst those which, having in the earliest planting days been allotted ample room, with the sole aim of making good single specimens, have repaid the planter in a manner I may certainly venture to call unusual.

Other Conifers unknown in anything like good condition in less favoured spots, here assume considerable proportions. Callitris and Athrotaxis form handsome trees. Saxegothæa conspicua is a failure—why, Mr. Mason is unable to say; but Fitzroya patagonica, represented by a strong young bush some 14 feet in height, spreads its graceful shoots in profusion. Various species of Cupressus are met with, and a specimen of C. torulosa, 25 feet in height, sweeps the ground with its foliage, whilst a stem of Libocedrus decurrens exceeds a diameter of 18 inches; and Ginkgo biloba, now only naked twigs, bids fair to assume the limit of its greatest known size. Araucaria Cookei, brasiliensis, and imbricata are yet young, little more than 15 to 20 feet in height; they are in excellent condition. Retinospora ericoides assumes extraordinary proportions, one specimen being nearly 10 feet. R. squarrosa is in no way behind it. R. plumosa aurea and Cupressus Lawsoniana lutea, the latter 14 feet in height, are highly coloured; for the middle of winter surprisingly so. Many hundreds of Camellias, certainly preferable to Laurels for ordinary planting, make good bushes; and the collection of Rhododendrons has received especial attention. With the exception of the Javanese, most known kinds can be grown. R. Dalhousiæ, Falconeri, Thompsoni, arborea, Jenkinsoni, cinnabarinum, Falconeri, argenteum thrive and flower well, with the exception of the last named, which is somewhat shy. Tall Cyatheas, medullaris and dealbata, planted for the most part in the rear of the borders, spread their immense fronds over wide circuits, occupied beneath by Violets, Narcissi, &c.

Anona triloba flowers. Carpenteria californica is a new shrub, Magnolia stellata is a mass of bud. Magnolia acuminata is shy here as elsewhere—in fact, it has never yet flowered here; it is represented by two perfect specimens, 20 to 25 feet in height, and affording a contrast to M. tripetala, freer in this respect.

Liriodendron tulipiferum, 35 feet, Paulownia imperialis, each shoot supporting a tall panicle in bud. Acacia alata, 35 feet high, is, in Mr. Mason's opinion, the best of the genus. Sterculia acerifolia, the famous New South Wales Flame Tree, and Cedrela australis are amongst the acclimatised trees.

The wide range and varied conditions under which the above-named plants are found in Nature, clearly point to there being many less favoured spots for the formation of a general garden than Wellington, N.Z. Likewise, it is not a question of the mere existence of so many species, for almost without exception all are in excellent condition, for Mr. Mason does away with those that do not please the eye, claiming to be purely and simply a gardener, and obtains no gratification from the mere possession of a species. Mr. Macnab owns the late Mr. Ludlam's famous garden, now somewhat neglected. Sir James Hector has six gullies on his private estate, clothed with hundreds of Tree Ferns, and native vegetation generally, in which pheasants and quail make their home, and mention must be made of the public garden, though it is of little interest. *James H. Veitch.*

WOOD FOR STREET-PAVING.

It has been proved to demonstration that wood grown in the forests of the antipodes can be placed on the market here at prices remunerative to the lumberman and speculative purchaser in London—this, too, in face of the fact that large supplies from much nearer neighbours of ours are continually being put up to auction. This is not to be wondered at when we consider the enormous fields from whence supplies can be drawn, the quality of the timber and the cost of freight. No man has a better knowledge of the value of Tasmanian timber for street-paving than the present Premier of the colony—Sir C. Bradden, K.C.M.G., for a long period Agent-General in London for Tasmania—this was made evident to the writer in the course of interviews two or three years since. Casting about for further information on the subject of this paragraph, we consulted the present Agent-General, and we now subjoin the pith of the information received.

The bulk of the experimental shipment of Tasmanian Blue Gum and stringy barkwood for paving purposes, per the fast steamer to which we called attention some months since, sold for five guineas per load of 50 cubic feet, the buyer paying all landing charges and the cost of cutting the timber into blocks, this being equal to about £9 15*s.* per 1000 blocks, supposing they had to be delivered cut up into blocks. A further shipment of 680,000 feet has been made in the colony, and has already started for London. These have been sold forward at the price above noted. Another similar shipment will be made early in February, but this has not yet been sold. The order of shipments of further supplies will depend on the state of the market. The saw-mills in the colony have formed an association, and have appointed Messrs. Shadbolt & Co., of 11, Billiter Square, E.C., their agents.

The reader may doubtless remember some "Wood Notes" which appeared in these pages some two years' since, in which it was stated that the exports from Tasmania to this country, to order, amounted to some 70*s.* worth—the exports from this country to Natal—there have been no exports thence so far as we can learn—having been valued at between £2 and £3. As for the supply of timber other than that for cutting into blocks, we have nothing to report—yet; stocks of various vessels are generally large enough to tide over three or four years: possibly merchants are, or soon will be, taking into account what can be had at the antipodes.

BERLIN

(From Our Berlin Correspondent.)

THE JAPANESE MELON.

In addition to the climbing Japanese Cucumber, which is highly esteemed here, the Japanese Melon certainly will be in a short time equally praised. The oblong Pear-shaped fruit is about 16 inches long, and weighs 2 kilogrammes, ripens very early, and has a delightful scent. The shell is alabaster-white, and becomes, when ripe, pale yellow. The taste is soft, the pulp spongy. One plant produces about ten fruits. When planted out in the open air at the beginning of June, the first young fruits appeared in the middle of July, which ripened at the beginning of September. Like the Japanese Climbing Cucumber, this Melon is not attacked by noxious insects, and very resistent against bad weather.

Begonia hybrida Pioneer.

The tuberous Begonias are very much liked in Berlin, but they want perfume. The Begonia Pioneer (Begonia Baumannii × gigantea), is the first sweet-smelling hybrid, with large, well-shaped, crimson flowers, of 8 to 10 centimètres diameter. The perfume is like that of a Tea Rose. The large fleshy leaves are oblique cordate. This novelty also withstands the weather, rain, cold, and wind, without injury.

Streptocarpus caulescens, Vatke.

This African species is worth growing in greater quantities in our stoves. It grows rapidly like an Impatiens, and flowers very freely. The flowers are about ½ inch long, bluish-red to violet. It flowers in November.

Mushrooms.

A new mode of Mushrooms culture was shown at the last meeting of the Verein für Beförderung des Gartenbaues at Berlin, November 29. Old cement casks are filled one-third with half-rotted horse-dung, and in this dung is laid the spawn of the Agaric. The casks are laid on their sides in rows one above the other, the spaces between them being filled in with fresh horse-dung, which affords regular warmth, and is afterwards employed for filling the casks. The casks are laid in a cellar, and furnish after a short time a good and regular crop. This mode of growth may be recommended for its cheapness. If one or another cask becomes by any cause unproductive, it may easily be withdrawn. The grower said that the warmth produced by the horse-dung is far better for the growth of the fungus than any artificial warmth, and the dung, after its warmth is spent, is used as a substratum in the casks. Cement casks are cheap, being sold here at 3*d.* each. The casks are covered over with the horse-dung after spawning and soiling.

Cattleya labiata autumnalis alba.*

This fine variety has pure white flowers, with the exception of the labellum, which has two large purple spots on the apex, and is finely rose-coloured and striated below. It was found among a large lot of imported specimens by Mr. Keyssner, a nurseryman at Zossen, who showed it, together with other specimens of Cattleya labiata vera at the meeting of the Verein für Beförderung des Gartenbaues, on November 29. Mr. Keyssner remarked that the colour of the true labiata autumnalis changes by forcing the flowers. The labella become paler the more they are forced, whilst those flowers which open in a cooler temperature have a deeper colour. This species flowers very readily, and is the best for market purposes. An inflorescence with four flowers brings the grower 6*s.*, each flower being sold for 1*s.* 6*d.* The species flowers from the beginning of October till the end of December.

Cut Flowers.

For the funeral of President Carnot one Belgian nurseryman sold in Paris sixty-eight thousand francs worth of the flowers of Odontoglossum crispum Alexandræ.

Chrysanthemums.

Amongst the seedlings of Chrysanthemums raised by Mr. Weber at Spindlersfeld, near Berlin, from seed imported directly from Japan by the Hofmarschall von Saint Paul Illaire, a very fine large-flowering variety was named Tangarita. The flowers are pure white, the single rays acute; the form is a very distinct one.

At the last meeting of the Verein zür Beförderung des Gartenbaues at Berlin, November 29, Mr. F. Weber, head gardener to Mr. Spindler, exhibited a very fine collection of Chrysanthemums. Amongst others, I remarked the following sorts: Léon Fraché (Japanese), flowers enormous, large violet-rose, white centre; Ada Spaulding (Japanese incurved), pale rose-coloured, in the centre lighter; Robert Owen (Japanese incurved), golden yellow, enormous flower; Duke of York (Japanese incurved), very large flower, cherry-red, silvery on the back; Geheimrath Professor Dr. Wittmack (Japanese incurved), violet rose-coloured, silvery on the back, similar to Mr. Freeman; George W. Childs (Japanese), very large flower of a brilliant dark-red colour; G. C. Schwabe (Japanese), gigantic red flower, yellow on the back, similar to Edwin Molyneux, but finer; Mdlle. Marie Hoste (Japanese), very large pure white flower, with broad rays; Mrs. A. A. Neve (Japanese), white, with a rose hue; Miss Mary Weigman (Japanese), canary yellow, very large; Beauty of Exmouth (Japanese), pure white; Waban (Japanese), violet-rose coloured, enormous flowers with broad, curled rays; Charles Blick (Japanese), enormous bright yellow flowers. Of an high interest were the seedlings, the seeds of which were imported by the Hofmarschall von Saint Paul Illaire direct from Japan, as above mentioned. Most of them are not yet named, only one, Tangarita, a pure white, very large, high flowers, with broad, acute rays, was named. Amongst the others are to be remarked No. VI., 12, and a pure white flower with broad, somewhat curled, horizontal distant rays. This flower may be the largest one known. VI., 98, a very large nankeen-yellow flower with tubular rays, VI. 1, a large-flowered golden-yellow form of exactly the habit of Shasta. X. 8, a pale rose-coloured large-flowered form of the form of Mr. Brunet. It is worth remarking that whilst in former years Mr. Weber did not equal the English flowers which were

* *Cattleya labiata autumnalis alba.* — Sepalis petalisqu albis; labello albo in superiore parte rubro bimaculato, inte riore parte roseo striato. *Udo Dammer.*

exhibited here on several occasions by Messrs. Reid and Bornemann, especially as to the number of rays, this year the flowers could well compete with the best English-grown flowers. This result was obtained by manuring the plants as early as possible, and by a right selection of the flower-buds. Each plant had at least six flowers, but there were also a good deal with much more. *U. D.*

THE HERBACEOUS BORDER.

ERYNGIUM PLANUM.

THIS plant should be in every collection of hardy herbaceous perennials, however small. It is a plant easily grown from seed sown in February, and the seedlings cultivated in gentle heat, they are strong enough to prick out into a bed where they may stay till September, and then be transplanted to the border. A rich sandy loam, deeply dug, suits the requirements of this plant. The plant is best planted when eight months old, it being a difficult one to remove when older, on account of the difficulty of dealing with the long tap-root. We have other varieties of Eryngium, viz., E. giganteum, alpinum, Oliverianum, amethystinum, and several more; but I am sure that this one will, when more generally known, become a favourite. Plant about six plants in a clump, in that way they are very showy.

TRITOMA (KNIPHOFIA) CORALLINA

This is a dwarf variety, very suitable for planting in a pocket on the rockery, or near to the margin of a herbaceous border. Tritoma Macowani is not at all a free grower with us. *H. May, Markree Gardens, Sligo.*

CULTIVATION OF PERFUME-YIELDING FLOWERS IN INDIA.

THE subject of the cultivation of flowers in India for the purpose of supplying material for the perfume industry has recently attracted the attention of the *Madras Mail*. It is pointed out that flower-farming might be widely extended over India, and might be made a profitable cottage industry. If a perfume factory were established in one of the hill stations, such as Bangalore, Coonoor, or Octacamund, a large number of flowers that are now simply wasted would be utilised and turned to valuable account. The well-known perfume-yielding plants that are cultivated so extensively in the South of France, such as the Lavender, Tuberose, Cassie, Jessamine, Heliotrope, Sweet Flag, &c., grow freely in Southern India, while the Rose culture, which is now carried on to some extent in the district of Ghazepore, might be considerably extended. The well-known Ylang-ylang (Cananga odorata), the oil of which is such a favourite with European perfumers, and which fetches a high price, grows all over Southern India, not only on the hills but in Madras, and in the plains, so that a systematic culture only is required to develop an extensive Indian trade. What is here said in reference to India, is applicable also to many other British possessions.

In connection with the subject of the growth of similar plants in France and Spain, the following interesting facts were recently given by a member of one of the largest firms of essential-oil distillers at Grasse, in the *Chemist and Druggist*. He states that the industry is still extending very largely in the South of France; within the last ten years the area under this culture has trebled, in spite of the fact that in Algeria, in Spain, and in some other parts, the industry has also made great progress. The Pelargonium culture, however, which was the chief occupation of the Algerian distillers, is becoming less and less important in that colony every year, chiefly because the production in the Island of Réunion has taken away many customers from Algeria, but Réunion in its turn is beginning to abandon the culture, as it has ceased to pay. The French Geranium-oil, however, is far and away the best, and so far as really high-class trade is concerned neither Algeria nor Réunion can compete. In Spain the cultivation of essential oil plants has become an industry of some importance recently. A large number of fragrant oil-yielding herbs grow wild on the plateau of Southern Spain, those bleak regions which Doré drew so well, but their oil is not available, as the districts where they grow are almost uninhabited, and it would not pay to carry portable stills to the distilling-grounds as is done in the French Alps; but even in France, quite a third part of the wild Lavender and Thyme are never distilled because they grow on hills that are almost inaccessible. Pennyroyal, Peppermint, Lavender, and Geranium, however, have been cultivated to some extent in the south and east of Spain lately. Spanish Geranium-oil ranks next to French, which is largely used by soap-makers, usually mixed with patchouly and Clove-oil, to bring out the odour. The cultivation of Wormwood, of which the oil is used in absinthe making, is declining very considerably. Formerly Wormwood-oil was in great demand in Holland and Germany, where it was used as an ingredient in some popular bitters; but of late the demand has declined.

THE BULB GARDEN.

WATSONIA O'BRIENII.

I WAS much interested in the contents of C. G. van Tubergen, Junior's, letter at p. 701, concerning the flowering of the above plant, because I have more than once urged the necessity for according many plants a treatment similar to that mentioned by him, in order to bring them back to a flowering state. There are many plants of a like nature to those named in the letter referred to, that we only flower either indifferently, or not at all. Both the experiment and the result in the case of the Watsonia are so absolute, that it can only be regarded in the future as a standard for reference in the case of species and forms not amenable to the usual treatment. Ornithogalum arabicum is one of those which requires year by year a thorough roasting in full sun; while some of the Cyclobothras, wintered over the hotwater-pipes in sand, have started growth, and flowered more freely than others merely secured from frost. Twenty years ago nearly, I first flowered Hyacinthus candicans, after a thorough rest, near a return-pipe in the greenhouse. In this instance, however, the treatment is not essential. Anemone fulgens, again, given two or three seasons in some clay soils will hardly grow at all, but if lifted and baked in full sun and replanted in the same garden, will flower well. It is perfect and absolute rest which appears to be necessary, and this, if possible, in full sun. *J.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

SOILS FOR WINTER POTTING.—Before hard frosts occur, the various soils, manure, &c., required in potting during the late months of winter should be placed under cover where frost does not penetrate, or where they may be protected from it with litter. Turfy loam should also be dug and carted-in, stacking it without delay in stacks with nearly upright sides and a sloping top. Loam one year old is in good condition for potting any kind of plant, but if kept for more than one year, much of its fibre becomes decayed, which is a loss to potted plants. In getting soil from a stack, the outside should be taken first if the heaps are large, this being the most sweetened by exposure, and it has also decayed the quickest. Charcoal should be separated into fine and coarse by sifting, each sort coming in for a different use. Spent Mushroom-bed soil is a useful substance, and a good quantity should be got in. The other items will consist of sifted leaf-mould, clean crocks and pots. The boxes used for cuttings and rooted plants may need repairing, and these should be looked to on wet days. Labels, both hanging and others; pegs for bedding plants and for layering purposes, stakes and flower-sticks, are among the numerous requirements which should be got in readiness at this season. Mixtures of soils for seed-sowing purposes should be prepared, making use in these of the potting-bench refuse soil, which if finely sifted, is by itself a useful material for covering seeds in the open and in boxes, &c.

PROPAGATING.—Cuttings of Aucubas, Skimmias, and other evergreens taken off in September and placed in frames with bottom heat should be examined, and if found to be well rooted, they should be taken out and placed in cold frames on ashes, keeping the lights closed for a time, and protecting from frost, and doing what is possible in gradually hardening them off. Cuttings of Hollies may be taken now, using short ripe shoots with a heel of the old wood attached.

TREE PÆONIES (PÆONIA ARBOREA).—These varieties are not so lasting in flower or so useful for cutting, and also not quite so hardy as the herbaceous varieties, and to succeed with them they must have a good deep loamy soil, or they will become poor stunted objects. They require protection in the spring to keep the young early-flowering shoots from being disfigured and injured by late spring frosts; and rough winds and rain very often disfigure these. It is best, therefore, to plant them where they will be screened from the sun till mid-day. Pæonia Moutan and P. M. papaveracea are often the only varieties of these plants met with in gardens, and where others have been worked on them the stock has been left to outgrow the graft instead of the graft receiving all the nourishment from the stronger-growing variety. Plants may often be obtained of these by removing the young suckers from old-established plants. There are now about a hundred varieties of these in cultivation.

GENERAL WORK.—Pick over and clean all plants, pricking up the surface of the soil, reversing the position of plants if they are standing in lean-to houses, keeping them as close to the roof-glass as is safe. If Coleuses are growing fast, the tops may be nipped off and utilised as cuttings. Look to all bulbs, Dahlia tubers, Lobelia cardinalis, Begonias, Gladiolus, also Fuchsias, Cannas in store, making sure that frost cannot reach them. Magnolias, Myrtles, Banksia Roses, and all tender shrubs should have the coverings fixed up ready for dropping down over them when the necessity occurs for so doing.

THE KITCHEN GARDEN.

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

FRENCH BEANS.—Continue to sow seeds in quantity in accordance with the demand and the conveniences of cultivation. Mould up the stems of those which have formed a pair of true leaves, and afford them a good watering before so doing. Liquid manure may be afforded plants when the soil is permeated with roots, including that which has been added in moulding up the stems. Keep the forcing pit moist in degree accordingly as the weather is bright or dull, and in well-lighted houses a free syringing may be applied on sunny days; but, under the opposite conditions of weather, a slight dewing-over in the early afternoon in addition to the usual damping of the floors will suffice for the needs of the plants. The pit or house should be covered at night with mats or Frigi Domo, as a means of saving fuel, and preventing the condensation of moisture on the glass and the resulting aridity.

WATER-CRESS.—The beds of water-cress should be cleared of weeds, scum, and floating rubbish, which choke growth and befoul the water. If the Cress is growing in a bed which can be submerged, it should be done on the approach of frost as a means of saving the crop for present and early use. As far as possible, the beds should be situated in a warm, sheltered position, and in such a spot running water will not readily freeze except in very severe weather. The submerged Cress may always be gathered by slightly raising the penstock, so as to reduce the level of the water. Where this method is impracticable, roots may be placed in shallow pans or saucers, partly filled with some fine mould, and coated with clean gravel, the saucers being then filled to the brim with water, and placed in a vinery or Peach-house now being started. The water in the saucers should be renewed every day. If only pans of soil and no water be employed, frequent waterings and syringings are necessary. In this manner sufficient Cress may be grown to tide over the winter, or till such time as growth begins on out-of-door plants.

TARRAGON AND MINT.—Roots should now be lifted and placed in boxes or pots (if large clumps of the former, 12-inch flower-pots will be most suitable), with a little good soil made firm about them, and placed in a forcing-house, removing them when the tops are sufficiently long for use, to cooler quarters, say, of 50° to 55°. If the soil used in the potting was moist, no water will be needed before the plants begin to grow.

CHERVIL.—This should also be lifted in clumps and placed on the border of a Peach-house or in a cool frame.

THE SPROUTING OF POTATOS.—The present is a desirable season for placing the tubers of early varieties which will be grown on hotbeds on end with the eyes uppermost to sprout. These varieties are even now beginning to grow, especially Sharpe's Victor. The most suitable receptacles for sprouting tubers are shallow trays or boxes, of a size which may be readily moved from place to place by one person. In these boxes place the tubers close together in one layer; and if no boxes can be had, stand the tubers on the floor of some cool well-lighted room to which frost has no access.

LATE CELERY, which continues to make growth, should have some more soil put round the heads, if it be not sufficiently moulded up already.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

ODONTOGLOSSUM CITROSMUM.—Most of the plants of the above-named species will by this time have completed their growth. To bloom this plant satisfactorily, it requires a long and decided rest, so that each pseudobulb can become fully matured, and a gradually diminishing quantity of water from the present time, which in a few weeks may be quite discontinued. Some cultivators do not like the pseudobulbs to shrivel; but shrivelling does not affect the well-being or flowering capacity of the plants in the least. When the flower-spike is perceived in the centre of the new growth, the plants should be immersed in tepid rain-water, allowing them to remain in it till the compost is saturated. It is wonderful to observe how quickly the pseudobulbs plump up again to their normal condition after this immersion. I attribute our successful flowering of this species to the severe drying process to which the plants are subjected during winter, and at Burford, under our methods of cultivation, the smallest pseudobulbs rarely fail to produce a flower-spike. The best position for O. citrosmum when at rest is near the roof of the Mexican-house.

FOG AND DULL WEATHER AND THEIR EFFECTS.—The recent weather has been unfavourable to Orchids, owing to lack of sunshine, and especially to those now forming new growths. Fogs have also caused the destruction of a great number of flowers, particularly those of deciduous Calanthes, Lælia anceps, Dendrobium Phalænopsis, Angræcum sesquipedale, Phalænopsis Schilleriana, and P. amabilis; but with the last-named plants, the loss may be remedied to some extent by allowing the spikes to remain on the plants till they have attained their proper length; then by pinching off the top of each, lateral shoots will branch out from the original flower-spike, growing quickly, and producing a quantity of flowers in the early spring months. Probably this method would, unless the plants were strong and vigorous, have an exhausting effect upon them, but this may to some extent be counteracted by cutting off each spike immediately the terminal bud has opened.

DAMPING DOWN.—A common mistake made by tyros in Orchid cultivation is in damping down the houses too often whilst the external air is moist. The paths and stages of the East Indian division should be well syringed each morning as soon as the thermometer indicates the required temperature, and again between 2 and 3 P.M., and if much artificial heat be required to keep up the temperature the paths may be sprinkled again in the evening. An important matter to remember when damping down in the afternoon is to thoroughly moisten the ground immediately underneath the hotwater-pipes so as to counteract the drying effect of these on the air during the night. In some instances it is almost impossible to avoid aridity owing to the construction of the houses, or from their being on a naturally-dry soil; and in such cases it is advisable to lower the temperature a few degrees. As regards the Cattleya and Mexican divisions, where the majority of the occupants are, generally speaking, at rest, less atmospheric moisture will be required, especially when the plants are subjected to a lower temperature than 55° at night, which in all probability they will be should severe weather come upon us. But during mild weather like that now prevailing, a moderate damping two or three times a week will be sufficient. There are many other species of Orchids besides Cattleyas and Lælias which require an intermediate-house temperature, viz., Cypripedium insigne, C. Spicerianum, C. Fairrieanum, C. Schlimi, C. barbatum, C. venustum, C. × Leeanum, &c., also Sobralias, Epidendrums, Miltonias, Cœlygynes, Vandas of the tricolor and suavis section, and others. Where, as in some collections, these species are accommodated in a house by themselves, they may be afforded a more moist atmosphere, and also more water at the root, than the plants in the Cattleya-houses. Where such an arrangement does not exist, the Cattleyas and Lælias should be stood altogether at one end, while the other species should be placed at the opposite. While on the subject of moisture in the houses, I may mention that we find the hygrometer a useful instrument for ascertaining the exact state of the atmosphere as regards moisture, especially throughout the winter months, and during severe frost. Here we have a house facing north-east, entirely filled with Masdevallias, and, owing to its being naturally damp, very little moisture needs to be applied at any time to keep the atmosphere sufficiently moist. One of the principal causes why black spot is so prevalent on leaves of Masdevallias of the Harryana section, is a too great abundance of moisture combined with a low temperature. A minimum of 50° at night should be maintained.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

BOUVARDIAS.—The flowering period of these plants now drawing to a close, points to the need of lessened quantities of water being afforded at the root by degrees, so that thorough ripening of the wood may result. Those plants from which the flowers may have been cut should be placed in a cool greenhouse, water being withheld, the moisture of the air sufficing to prevent any undue shrivelling of the shoots.

HIPPEASTRUMS (AMARYLLIS).—In order that the re-potting of the plants may have a fair start, pots should be washed clean, crocks prepared, and the potting materials placed in readiness. A few of the stronger bulbs should first be re-potted for early flowering, but the re-potting of the main batch postponed to January. Continue to push on in warm-houses the young stock of bulbs. If well rooted, a slight manurial aid may be afforded them at regular intervals.

POT-ROSES.—Most of the leaves having fallen, the pots should be placed in a cold pit or frame, provided there is ample head-room, plunging the pots to the rims in coal-ashes or dry leaves; and save for the giving of air on all favourable occasions, they will need no other attention till the time arrives for starting them anew. If mildew should still adhere to the shoots, dusting with flowers-of-sulphur will destroy it.

CYCLAMENS.—These plants are now giving much bloom, well filling the gap between the blaze of the Chrysanthemum and the flowering of forced plants. Owing to the moist weather a very small amount of water is needed at the root; but any dryness of the atmosphere of the house should be carefully avoided, and if as previously directed the pots are standing on fine gravel, coal-ashes, or shingle, these substances as well as the paths should be moistened once daily. Plenty of air may be afforded if a slight heat in the hotwater-pipes be kept up, but draughts must be avoided.

ZONAL PELARGONIUMS.—The earliest batch of these plants will now have finished flowering, and should be removed to the shelves in a cool greenhouse to ripen the shoots preparatory to being cut back. Cuttings of any desirable variety may be made and placed round the edges of 48's, using a sharp sandy soil, and placing them in a vinery or Peach-house that is being started.

POINSETTIAS.—Feeding the plants should still be carried out, and farm-yard drainings afforded once a week form a good manure for them. This will increase the size of the bracts which as yet are not of their full size. A few plants placed in convenient parts of the stove add a pleasing bit of colour; while the bulk of the plants may be arranged in a house by themselves, making use of Ferns in the grouping.

AZALEA DEUTSCHE PERLE.—Than this variety no better can be had for pushing into flower for meeting Christmas requirements. I find that this year the buds are in a very forward state, some of the most prominent being in flower in cool quarters, and the retarding of the blooming period has had to be practised instead of forcing. I should point out, however, that where this flower is in demand at the above-named season, and in case severe frost should set in during the interval, a few plants should be put into forcing quarters, and forwarded to a stage at which they can be easily pushed into flower, removing them to a slightly cooler house, should this be likely to happen at a too early date.

CALLAS (RICHARDIA).—This is another favourite at the approaching season that should not be overlooked; and should the requisite number of spathes be not forthcoming under the existing conditions, then advantage must be taken of vineries and Peach-houses, which are being forced to place the more advanced plants therein, where they will soon show spathes. Keep a sharp look-out for green-fly, as the increased heat and moisture will tend to propagate this pest.

SHOW PELARGONIUMS.—Pinch out the points of young plants now in large 60's, place a neat stake to each to give support to the side-shoots, slinging these as they grow to this stake. The plants, if well rooted, may be watered once weekly with weak soot-water till the beginning of the year, when they should be shifted into 48's. Guard against attacks of aphis by fumigating the house once a fortnight.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

KEEPING GRAPES.—Constant care will be required in the case of Grapes on the Vines and in the Grape-room, the chief enemies to good-keeping being damp, mice and rats. The rodents are particularly fond of the fruit, and I have known rats to take away whole bunches of Grapes in a night. It is a good plan to place a liittle phosphorus-paste on small pieces of bread, and place these under the floors or pipes, where dogs or cats cannot reach them. As a protection, half-inch-mesh wire-netting should be fixed in the borders against the arches or pillars, if rats are in the habit of making an entrance to the vineries from that point. Rats will soon let you know which are the best-flavoured Grapes. Cats should also be kept in a large garden; they are the best thinners of the rats and mice. Abundance of air should be given to the Grape-room and vinery during dry days, the temperature being kept about 45°, not lower, and it is necessary to have a good deal of heat in the hot-water pipes sometimes, especially on windy days, which are the most suitable for ventilating purposes. Plants which need much water at the root should be excluded from vineries where Grapes are hanging; but bedding Pelargoniums, and anything that requires to be kept dry during the winter, may be tolerated. If not much fruit is left on the Vines, it is best to cut the bunches, and place them in bottles of water in a dry room, if a Grape-room be not available. Then the Vines can be pruned and rested for as long a time as possible before starting them again, the longer being the rest the better the prospect of a good crop of fruit the next season.

PEACHES AND NECTARINES.—In the early-house which was closed at the end of November the temperature should be 50° by night, 55° to 60° by day, and may range on sunny days 10° higher than the higher figure, air being afforded freely at the top of the houses at the same time. Great care is necessary in the application of artificial heat at this part of the season, especially at night, it being better practice to allow the warmth to sink to 45° than to rise to 55°, which would render the starting of the wood-buds in advance of the bloom-buds a probability, causing weakly and deformed flowers, which would set imperfectly or not at all. Maintain a moist warmth, but not a stagnant atmosphere. As the flower-buds approach the time for expanding, a very light syringing once a day may be afforded, and even this will not be required in foggy or frosty weather if the floors and walls are well moistened over, and a genial buoyant air maintained. Under this kind of treatment, the buds swell, and the flowers are larger and more perfectly-formed than if heavy syringings are indulged in. As the flowers expand, much attention should be paid to the ventilation, especially in frosty weather, the front ventilators being kept closed, unless during very bright sunny days, when they may be opened a trifling space, air being in a general way obtained from the top lights, as well as by leaving a little opening all night whilst the trees are in bloom. No hard-and-fast rule can be laid down in this matter, and the gardener must use his own discretion, avoiding always, sudden fluctuations of temperature. The syringing of the Peach trees when in flower should be discontinued till after the setting period is passed, and the flowers fertilised every day by passing a camel-hair pencil or rabbit's tail lightly over them, and also by gently shaking the trees. Some varieties of the Peach produce more pollen than others, and a rabbit's tail is a good medium for conveying it to those which are less well provided.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	DEC. 17	Dutch Bulbs at Protheroe & Morris' Rooms.
TUESDAY,	DEC. 18	Dutch Bulbs at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 19	Japanese Lilies, Roses, Amaryllis, &c., at Protheroe & Morris' Rooms.
THURSDAY,	DEC. 20	Dutch Bulbs at Protheroe & Morris' Rooms.
FRIDAY,	DEC. 21	Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.8.

Forestry in America.

IT appears that Great Britain is not the only country which leaves the systematic management of her forests to private enterprise. In the Alleghany Mountains of North Carolina, Mr. G. W. VANDERBILT has been devoting some of his spare capital to the purchase of large tracts of forest land which have been partially denuded by the lumbermen, and in many places cleared and cultivated for short periods. These tracts Mr. VANDERBILT has placed under the care of an expert, with a view to restocking and working them on principles similar to those on which the state forests of Continental Europe are managed. The purchaser, we are told, is animated with the praiseworthy ambition of thus inaugurating a system of economic forestry in the United States, and, we may also assume, of making a sound investment for the benefit of his heirs. Mr. PINCHOT, who has been entrusted with the carrying out of this work, has published a pamphlet descriptive of a portion of the property known as "Biltmore Forest," consisting of nearly 4000 acres lying on the banks of a tributary of the Tennessee River. An account of this forest, contributed to a recent number of the *Zeitschrift für Forst und Jagdwesen*, by Sir DIETRICH BRANDIS, furnishes some interesting particulars regarding the present condition and stocking of the tract. No fewer than seventy-two species of trees are to be found, among which may be enumerated seven species of Oak, five of Maple, five of Pine, four of Hickory, &c., Spanish Chestnut being the only European tree. Broad-leaved species predominate, especially the Oak (Q. alba), which, together with black Walnut and Liriodendron, prove the most valuable as lumber, but the two last have, unfortunately, almost disappeared from this forest.

So far, the principal operations have been confined to the demarcation of working blocks and compartments, and the removal of badly-thriving and stunted trees. An opportunity has also been taken of inculcating more careful and economical methods of felling upon the lumbermen and woodmen of the district, in place of the wasteful style of working commonly practised. Mr. VANDERBILT intends introducing various exotic species into certain parts of the forest, in order to test their adaptability for the district, and a large nursery has already been formed. A library of forest and botanical literature has also been established in Biltmore, so that a nucleus for a possible forest school is already in existence.

Sir DIETRICH BRANDIS is of the opinion that forestry prospects in the United States are brighter than some would have us believe. He considers that a steady rise in the wages of the American labourer is likely to render intensive agriculture out of the question in many districts. At present, Wheat is principally grown in forest districts by methods similar to those practised in some parts of India, and known as "fine cultivation." In course of time this system of agriculture must cease, and the relative conditions of American agriculture and forestry will alter to the advantage of the latter, while the extention of railways will raise the price of timber. Another force likely to promote the cause of economic forestry lies, Sir DIETRICH BRANDIS believes, in the limited power of the "almighty dollar" in satisfying American ambition. Millionaires must find some means of immortalising the family name, and what could effect this better than the possession of extensive forests? Nevertheless, Sir DIETRICH BRANDIS is inclinced to think that State intervention might accomplish the desired state of matters more rapidly even than family pride, and the history of European forests would seem to confirm this latter view. Sir DIETRICH BRANDIS concludes by reminding his readers that they in Germany consider the serving of their country a more honourable occupation than the advancement of personal interest. Americans have not yet reached this high standard of public morality, hence their dread of any increase in the official staff which state-forestry would involve. In this last statement we possibly find the key to the indifference and apathy which our own government exhibits towards the forestry question, and explains the invariable adjournments of those occasional parliamentary debates on the subject, the resumption of which we never hear of.

OUR ALMANACK. — Secretaries of Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and Meetings of Botanical and Horticultural Societies of any kind for 1895, for insertion in the Almanack, to be published in our issue for January 5.

SERRASTYLIS MODESTA, *Rolfe, new genus and species.*—That this singular Orchid should have escaped detection by the many plant-collectors who have passed over the Cauca seems a singular circumstance, and the fact itself should give hope to the amateurs of novelties who are content with such simple beauty and curious structure. At the end of 1893, some half-dozen plants of it were discovered by Mr. F. C. LEHMANN, and in due course one which fell into the hands of Sir TREVOR LAWRENCE flowered, and was found to be of a new genus entirely. It was named Serrastylis modesta by Mr. ROLFE, and published in the *Kew Bulletin* of May, 1894. At the meeting of the Orchid Committee of the Royal Horticultural Society on Tuesday, November 27, 1894, another specimen was exhibited by Major JOICEY, Sunningdale Park, Sunningdale (gr., Mr. F. J. THORNE), when it was awarded a Botanical Certificate, and supplied the material for our illustration (fig. 91). The sepals and petals are reddish, edged with yellow; the lip white, with a few purple streaks. A curious feature in the flower is the arrangement of the two large wing-like auricles on the column, the side-lobes of the lip being similarly formed, and curiously arranging with them in colour and shape, although on separate organ. The plant is said to stand near Brassia. In habit it resembles a small Oncidium sarcodes, and it is said to thrive well in the Cattleya-house,

"THE BOTANICAL MAGAZINE."—The December number contains portraits and descriptions of the following species:—

Eulophiella Elisabethæ, Linden and Rolfe.—A remarkable Madagascan Orchid, first shown in bloom at the last Ghent Quinquennial by M. Linden.

Daphne caucasica, Pallas.—A hardy shrub, introduced by Mr. Smith of Newry. It is of dwarf habit, with linear, oblanceolate leaves, whitish on the under surface. Flowers white, in terminal clusters, each with a narrow tube about half an inch long, and a five-parted limb. Kew.

Erycina echinata, Lindley. A Mexican Orchid of singular appearance, like a small Oncidium, but with an equally three-lobed lip, and a column destitute of wings, with a long rostellum, and long, incumbent anther. Kew.

Strophanthus Petersianus (Klotzsch) *var. grandiflorus*, N. E. Br. A climber from Delagoa Bay, with shortly-stalked, oblong, lanceolate leaves, and terminal clusters of funnel-shaped orange-coloured flowers, 1½ inch long, the fine petals prolonged into long tails. Kew.

Gmelina hystrix, Schultes.—A climbing-plant of the Philippine Islands, and belonging to the Verbenaceæ. The leaves are shortly-stalked, oblanceolate, entire, or somewhat lobed, glandular on the under surface. The flowers are in terminal heads, intermixed with broad, boat-like bracts, with purple veins. The flowers are 2 inches long, with a small-cup-shaped glandular calyx, and a yellow corolla of about the same size and form as in a Foxglove.

—— The *Botanical Magazine* for the present year is dedicated by the Editor, Sir J. D. HOOKER, to Mr. CHARLES FORD, Superintendent of the Botanical Garden at Hong Kong, in recognition of the numerous interesting and beautiful Chinese plants introduced by him to Kew, and accompanied by the Editor's congratulations on Mr. FORD'S successful labours as a botanist and forester, "which have contributed so largely to the resources, the health and beauty, of your Island Home."

ROYAL GARDENERS' ORPHAN FUND.—A meeting of the committee was held at the Horticultural Club Hotel, Windsor, on December 7, Mr. William Marshall presiding. The secretary announced the purchase of £500 worth of consols. The following special receipts were announced: The Reigate Chrysanthemum Society, £10; Rugby Chrysanthemum Society, per Mr. W. Bryant, £5; Mr. Toogood, per Mr. G. W. Cummins, 10*s.*; The Croydon Chrysanthemum Society per Mr. W. B. Beckett, £3 3*s.* 6*d.* Mr. G. Bolas, two donations collected, £2. Mr. Savage, per Mr. G. Munro, £1; Mr. J. Miller, Ruxley Lodge Gardens, £1; Mr. F. Miller, Margate, £2 12*s.* 6*d.*; Market Harborough Horticultural Society, per Mr. Green, Secretary, £2 2*s.*; and Mr. G. Fennell, Tonbridge, 5*s.*; and the following boxes: Mr. J. Miles, Southampton, £2 13*s.* 6*d.*; Mr. T. J. Nelson, Chesterfield, £1 8*s.* 9*d.*; Mr. C. Gibson, Mitcham, £1 7*s.*; Young Men at Park Place, Henley, per Mr. J. T. Powell, 18*s.*; Mr. T. Newbould, Rawdon, Leeds, 14*s.*; Mr. G. T. Cole, Ascot, 14*s.*; Messrs. H. Cannell & Sons, Swanley, 10*s.*; Mr. N. Kneller, Malshanger Park, 10*s.*; Mr. A. D. Christie, Alcester, 12*s.*; Mr. J. Lemmon, Chichester, 7*s.* 6*d.*; and Mr. R. Scott, Bradford, 5*s.* 8*d.* It was resolved that the date of the annual general meeting and election be Friday, February 8. The names of four applicants, in addition to those not elected in February last, were announced. It was resolved that six children be elected upon the Fund at the next ballot.

NATIONAL ROSE SOCIETY. — The balance-sheet shows a balance on the right side of £72 11*s.* 9*d.* The receipts, including a balance of £81 19*s.* 3*d.*, amount to £795 1*s.* 11*d.*, the expenditure to £722 10*s.* 2*d.* Windsor only contributed £40 to the receipts, against £105 from the Crystal Palace; the expenses in connection with Windsor amounting to £4 13*s.*, those at the Crystal Palace to £9 1*s.* The prizes at Windsor amounted to £93, at the Palace to £275 15*s.*, and at Halifax to £130 15*s.*

Fig. 91.—Serbastylis modesta (Rolfe): flower segments reddish, edged with yellow; lip white, with purple stripes. (see p. 726)

National Chrysanthemum Society.—A meeting of the general committee took place at Anderton's Hotel, Fleet Street, E.C., on the 10th inst., Mr. B. Wynne in the chair. A letter was read from Mr. J. W. Wilkinson, secretary of the Royal Aquarium Society, stating the willingness of the directors to contribute the sum of £50 towards a Dahlia show in September next. An interim financial statement of a very satisfactory character was submitted by the secretary, and it was resolved that the annual general meeting should be held on Monday, February 25. Twelve ordinary members and two Fellows were elected, bringing the number elected in the year just closing to 130 ordinary members and eleven Fellows. The Swindon Amateur Chrysanthemum and Horticultural Society was admitted to affiliation, making a total of nineteen Societies for the year.

Bournemouth and District Gardeners' Association.—On Tuesday, December 14, the members of the above Society spent a pleasant and profitable "Evening with the Microscope," through the kindness of J. F. Tanner, Esq., a well-known microscopist. Before exhibiting the splendid slides illustrative of the structure of the different parts of plants, Mr. Tanner read a valuable paper, in which he explained how the various tissues in a plant were built up of cells; and sketched, with some amount of detail, the life-history of a Fern. This paper, which was illustrated by excellent diagrams, made it possible for the audience to understand what they actually saw under the microscope. Without such an introduction to the subject, the objects might in many cases have merely struck the observer as being "pretty." The collection of slides shown comprised pollen grains of various flowers, with and without pollen-tube development; transverse and longitudinal sections of stems, leaves, and roots; cuticles of leaves, showing stomata; parasitic fungi, &c. Hearty votes of thanks were accorded to Mr. Tanner and to Mr. Hope, who had added much to the interest of the gathering by exhibiting a collection of slides under his microscope.

LINNEAN SOCIETY.—An evening meeting will be held on Thursday, December 20, at 8 P.M., when the following papers will be read:—1, "On the Spinning-glands in Phrynus," by H. M. BERNARD, F.L.S., &c.; and 2, "On Monocotyledonous Saprophytes," by PERCY GROOM, F.L.S., &c.

—— On the occasion of the meeting of the Society, Thursday, December 6, Mr. C. B. CLARKE, F.R.S., President, in the chair, Mr. WALTER TOTHILL was elected a Fellow. Mr. E. M. HOLMES exhibited and made remarks upon a small collection of Japanese marine Algæ, some of which were of considerable rarity in European collections. Professor D. CAMPBELL brought forward some illustrations of the relations of vascular Cryptogams as deduced from their development. His remarks, which were listened to with great attention, gave rise to an interesting discussion, in which Professor BOWER, Dr. D. H. SCOTT, Mr. CARRUTHERS, and Professor MARSHALL WARD took part. "A New Revision of the Dipterocarpeæ" was the title of a paper by Sir DIETRICH BRANDIS, K.C.I.E., who gave an excellent account of this order of forest trees, and their structure and mode of growth, together with a survey of the literature relating to them, and a clear exposition of his views concerning classification. He pointed out that the order Dipterocarpeæ consists almost entirely of large trees, which do not flower until they have attained a great size, with a spreading crown on a branchless stem often more than 100 feet high. Hence, it is difficult to obtain complete specimens in flower and fruit; and this explains why a large proportion of the genera and species have only of late years become accurately known. KORTHALS, in 1840, knew 34 species; DE CANDOLLE, in 1868, described 126; Mr. THISELTON DYER in 1874 estimated the order at 170. Sir D. BRANDIS now considers that there are 320 well-ascertained species belonging to sixteen genera, omitting the genera Ancistrocladus and Lophira, which he regards as justly excluded from the order. Notable species are the Sâl tree of India (Shorea robusta), great forests of which extend along the foot of the Himalayas, and in Central India; the Eng tree (Dipterocarpus tuberculatus), of similar growth in Burma; and others found in Cochin China and Borneo. In the discussion which followed, an extended criticism was offered by Mr. THISELTON DYER, who had paid special attention to this order of trees, and who, admitting the soundness of the author's views, considered his exposition of them most valuable. The paper was illustrated by lantern slides, showing the chief peculiarities of structure in flowers and fruit.

MR. CHARLES WARDEN.—Sir F. H. BATHURST, Bart., Clarendon Park, Salisbury, has placed the Home Farm and woods under the management of Mr. CHARLES WARDEN, who has ably filled the post of Head Gardener at Clarendon during the last twelve or fourteen years; a position which he still retains. In addition to being a good all-round gardener, Mr. WARDEN is an energetic and good business man, and we are sure he will have the good wishes of his gardening friends and acquaintances in his new sphere of duties.

THE VIOLA CONFERENCE.—The Report of the Conference held at the Botanical Gardens, Edgbaston, in August last, has been published. It contains, in addition to a report of the proceedings, portraits of the promoters and officials of the Conference, together with others of celebrated raisers.

EDINBURGH CHRYSANTHEMUM SHOW.—We cull from the *Edinburgh Evening Dispatch*, of Wednesday December 5, that at a meeting of the Scottish Horticultural Association held in Edinburgh on Tuesday December 4, Mr. A. M'KENZIE, treasurer, submitted the accounts of the Chrysanthemum Show. He stated that that show was the second most successful show they had held in the Waverley Market. The income only showed an increase over that of last year of about £15, but the expenditure had been curtailed. The gross income was £996, and the expenditure £872, leaving a balance in hand of £124. From the surplus it was agreed to give £5 to the Royal Infirmary, and £3 to the Gardeners' Orphan Fund.

THE ANTWERP EXHIBITION.—Horticulture has been recognised by the award of Decorations of the Order of Leopold to MM. J. Everaerts, Ch. Vanderlinden, Florent Pauwels, Jules Closon, F. Massange de Louvrex, Raphaël De Smet, Paul De Schryver, our correspondent, and M. Charles De Bosschère. M. De Cock, President of the horticultural section, was promoted to the grade of Officer of the Order of Leopold.

A TRAVELLER'S NOTES.—In the present issue we bring to a conclusion the remarkable series of letters contributed to our columns by Mr. JAMES H. VEITCH. The first letter appeared on March 12, 1892, and was devoted to the account of the traveller's impressions of Ceylon. India from south to north and east, Burmah, Singapore, Java, Japan, Corea, all the Australian colonies, and New Zealand were visited in succession. Never has any horticulturist traversed in one journey so large and varied an area. Many of the districts visited are rarely seen by ordinary travellers and globe-trotters, and no more complete account of the botanical and horticultural establishments of the countries visited has ever been published. We trust that the results may be commensurate with the enterprise and zeal that planned this journey and carried it out to so successful an end.

HORTICULTURAL MEETING AT GHENT: DECEMBER. — M. Jules Hye staged some hybrid Cypripediums, noticeable among them C. Hébé, with very wide and much-undulated petals; one of the parents is doubtless C. Spicerianum, the other might well have been C. Sallieri; C. Augusta, with a very fine lip; C. Nicias, C. delicatum, parents unknown, according to the label, but decidedly showing the influence of C. Spicerianum; C. Romulus, a hybrid from C. Chantini and C. Sallieri, the characteristics of which it displays. Odontoglossum virginale, from the same exhibitor, was admired for its handsome lip, tinged with very bright yellow, and very distinct; the sepals are much spotted with greenish-yellow. There were also shown — a fine, well-flowered variety of Oncidium ornithorhynchum, from M. Coryn; Cattleya labiata (white), from M. Devolder; and a Cypripedium Charlesworthi, with very large standard, from M. Dallière—all first-class Orchids. Jatropha podagrica, from M. de Smet-Duvivier; Cliveia fol. var., from M. Capitaine; a fine new Croton, C. Duvivierianus, whose principal tints are yellow and green, and with broad and fine foliage, from M. de Smet-Duvivier; and Bilbergia Cappei, much like B. Leopoldi, from M. Poelman-Maenhout, must also be mentioned as among the best plants staged.

FOREST HILL AND CATFORD HORTICULTURAL SOCIETY.—Among suburban societies which has achieved success this year may be mentioned the above, which has, as is shown by its balance-sheet, paid its way during the first year of its existence, and has the gratification of possessing a balance in the hands of the treasurer, amounting to more than £15, which, as the report says, is eminently satisfactory. Doubtless the Society will be accorded generous support in the district from the numerous amateurs resident therein. A general meeting will be held on Monday, December 17, at St. James' Hall, Stanstead Park, at 8.30 P.M. The Society is affiliated with the Royal Horticultural.

THE FAT BEAST SHOW.—The annual exhibition of the Smithfield Club was opened in the Agricultural Hall, Islington, on Monday last, the 10th inst., and was the centre of very considerable interest during that and the four following days. As was announced recently in our columns, a new feature in the schedule for the present year was a number of classes for dead poultry, and in the annexe of the large hall a good display of excellent poultry was made. As is usual on the occasion of the Christmas beast show, there were numerous stands of agricultural and horticultural roots, seeds, and fruits contributed by well-known firms, such as Messrs. Sutton & Sons, Reading; Webb & Sons, Stourbridge; Carter & Co., High Holborn, London; Harrison & Sons, Leicester; Cheal & Sons, Crawley; Dickson & Co., Chester; Jarman & Co., Chard, Somerset, and others. Implements of various descriptions for field and garden purposes were also exhibited on a large scale, and a visit to these annual meetings of the Smithfield Club has an educational attraction for the horticulturist as well as for farmers and others more directly interested in the exhibition; but the display of animal fat that is seen is discouraging and repulsive to any who favour vegetarian principles in any degree.

"THE HORTICULTURAL DIRECTORY."—This useful publication for the ensuing year has again made its appearance. It embodies all of the familiar features, including the particularly useful list of plants which have received certificates and awards of merit from the Royal Horticultural Society during the interval from October, 1893, to September of the present year. It is published at 171, Fleet Street, London, E.C.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—The annual general meeting of the Royal Caledonian Horticultural Society was held on Thursday, the 6th inst., in Dowell's Rooms, Edinburgh. Mr. M. DUNN, Dalkeith, presiding. Mr. FRASER, the Treasurer, submitted an abstract of the accounts for the year ending November 30 last. The receipts, it appeared, had amounted to £1496, of which the drawings at the three shows held during the year accounted for £1013, and the members' subscriptions to £390. On the other hand, the payments had reached the sum of £1641, making an excess of payments over income of £144. During the year £901 had been given in prizes at the several shows. On November 30, 1893, the funds of the Society amounted to £1183; at the corresponding date this year the amount was £1030, showing a decrease of £153. The Chairman said they would observe that there was a balance on the wrong side of the accounts this year, but the Council had taken steps to ensure that next year instead of the balance being on that side, it would in all probability be on the other, and that the amount would be about the same. The Council had agreed to hold only two shows next year—the spring show, which was always a paying show, and the autumn show, which was also a popular exhibition. They could not, however, see their way to make any inroads on the prize-lists of these two shows. The financial report was approved of. On the appointment of office-bearers being taken up, the Marquis of LOTHIAN was reappointed President, and Sir JAMES GIBSON CRAIG, Bart., of Riccarton, was appointed a Vice-president. Mr. JAMES MILNE was elected representative of the nurserymen on the Council, and Mr. DUNN was reappointed a member of the Council. In returning thanks for his re-election to the Council, the Chairman said the Society, in the matter of its expenses, would compare very favourably with any other in the country. Mr. FRASER and Mr. STEWART were reappointed Treasurer and Secretary respectively. *Edinburgh Evening Despatch, Thursday, Dec.* 6.

DISEASES OF PLANTS.—The Royal Botanical Society of Belgium has appointed a committee of research and of reference, in order to supply cultivators with information relating to the various maladies which infest plants. The members consist of MM. Marchal and Nypels of the Botanic Garden, Brussels, MM. Gravis and Michiels, Liège, and Laurent of Gembloux, to whom botanical specimens, fungi, &c., may be sent. Insects in like manner may be forwarded to M. Lameere, Chaussée de Charleroi, 119, Brussels, or to M. Poskin Agricultural Institute of Gembloux.

BOTANICAL SOCIETY OF EDINBURGH.—The first part of the twentieth volume has been issued. In addition to the usual records of temperature and outdoor vegetation which have been continued for

some years, details are now given (by Mr. HARROW) of the most remarkable and interesting plants that flower in the several houses. An account of the late Mr. JENNER'S garden at Easter Duddingston will interest horticulturists. A paper on the history of Saxifraga Wallacei × is given in which it is stated, on the authority of Mr. J. GRIEVE, to be a hybrid between S. Maweana and S. Wilkommiana raised by Mr. GEORGE WALLACE.

THE BOTANICAL EXCHANGE CLUB.—The report for 1893, which has lately reached us, contains a record of the plants collected by the members and distributed by the club, together with critical notes on their structure and distribution.

SOCIETY OF AMERICAN FLORISTS.—The report of the tenth annual convention of this Society, at Atlantic City, N.J., has been forwarded to us. It contains a record of the business proceedings, as well as of the social gatherings incident to the meeting. A full list of members and their addresses forms a useful appendix.

EALING GARDENERS' ASSOCIATION.—The weekly meeting took place in the Victoria Hall on the evening of the 4th inst., when Mr. A. WRIGHT, of the Gardens, Falkland Park, South Norwood, read a very able paper on "The Orchard House and its Management" before a large meeting. At the outset he dealt with the advantages of an orchard-house, and said no matter what weather we had, a good crop could always be obtained. Referring to dessert Pears, the opinion was expressed that handsome profits could be made in the winter months from select fruits grown under this system of cultivation. The necessity of potting every three or four years, and of top-dressing every season, laying particular stress on the use of lime-rubbish and wood-ashes in the potting, were alluded to. Mr. WRIGHT also mentioned the best stocks suitable for Apples, Pears, Plums, Cherries, &c., remarking that Bigarreau and May Duke Cherries should be double-worked, using the Mahaleb stock, giving also a list of the best varieties of fruits for this form of culture. The necessity was urged of placing the plants out-of-doors for four or six weeks before they were ripe to ripen there, and to increase the flavour of the fruits. The resting of the trees, too, in winter was dwelt upon, it being stated that mistakes were often made by ripening the trees too dry. The beauty and effectiveness of the orchard-house when in blossom were remarked upon. A good discussion followed the reading of the paper, all agreeing that the subject had been treated in a thoroughly practical manner by Mr. WRIGHT, who was cordially thanked for his very capable production.

SCOTTISH HORTICULTURAL ASSOCIATION.—The following awards have been made in competition, open to all assistant gardeners, viz.: For the best collection of herbaceous plants, dried and correctly named, 1st prize to Mr. A. MCLENNAN, Easter Duddingston Lodge, Portobello, N.B. (405 varieties); and 2nd prize to Mr. J. C. NEWSHAM, 3, Cumberland Place, Kew. For the best plan of laying-out a kitchen garden of not more than 2 acres, plan to be drawn to scale; 1st prize to Mr. GEORGE BEECH, Morton Hall, Liberton; 2nd prize to Mr. J. C. NEWSHAM, 3, Cumberland Place, Kew; and 3rd prize to Mr. A. GRANT, Callender Park, Falkirk.

M. COGNIAUX.—A Belgian botanist, well-known for his monographs on Cucurbitaceæ, Melastomaceæ, &c., and now engaged on a revision of the Brazilian Orchidaceæ, has been elected an honorary member of the Torrey Botanical Club, New York.

PUBLICATIONS RECEIVED.—*Hints on the Planting of Orchards*, by Prof. Bailey.—*Native Dwarf Cherries*, from the same (Prunus pumila, Prunus Besseyi, and a hybrid between Besseyi and Watsoni).—*Cultivation of Orchards*, by Prof. L. Bailey; these constitute Bulletins Nos. 69—72 of the Cornell University Experiment Station, Ithaca, New York.—*Boletim da Sociedade Broteriana.*—*The Effective Advertiser.*—*The Book of the Rose*, Rev. A. Foster-Melliar (Macmillan & Co.)

HOME CORRESPONDENCE.

DOUBLE LYCASTE.—At the last meeting of the Warsaw Horticultural Society, a new form of Lycaste Skinneri was shown by Mr. F. Kaczynski, of the firm of Kaczynski Brothers, nurserymen, Warsaw. The new variety resembles, in all parts, the common L. Skinneri, the only difference consisting in the fact that two flowers are put closely together, this doubleness being observed for several years, so that the plant may be regarded as a novelty, but I would ask your Orchid-growers for their advice in that matter. The new Lycaste has been named Lycaste Skinneri Turkiewiczi, in honour of Mr. Turkiewicz, President of the Warsaw Horticultural Society. *Brothers Hoser, Aleja Ferozolimska, Warsaw.* [We do not understand the nature of the double condition. If our correspondent can obligingly send us a flower, we will examine it and report. ED.]

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—I would like to ask, through the medium of your columns, who is responsible for the descriptions appended to the names of the candidates appearing in the official list of the above for 1893-4? That such descriptions should be most complete and full in their every detail, even to the place where each and every candidate performed his first duties as a gardener, is of the greatest importance to a very large mass of gardeners, and particularly so to all who are subscribers to the above institution. I am led to make this inquiry, because I am informed that one candidate at least in the above-named list was not a gardener at all till he had attained the age of 45 years or more. As a matter of fact, he was a shoemaker till that time—a piece of information not found in the list referred to; yet, notwithstanding, this particular candidate, in some apparently mysterious way, obtains upwards of 850 votes; while a life-long gardener, who has also contributed 11 guineas during a period of 11 years to the funds of this institution, only manages to obtain 556 votes. Two other life-long gardeners (non-subscribers, like the first-named candidate) only obtained 27 and 71 votes respectively. Assuming that present claims in each case are equal, surely the life-long gardener should stand the best chance of being elected a pensioner, in preference to one who has spent the best part of his life following a distinctly foreign calling. This should be so, even supposing both to be non-subscribers; and more so when we find one candidate subscribing for 11 years, and in the end 300 votes behind. Is it a case of haphazard voting, or is it favouritism? *Enquirer.*

A NEW WINTER VEGETABLE.—A vegetable has lately appeared in the seedsmen's catalogues under the name of Seakale, or Silver Beet. The midrib of the leaf is the part which is recommended to be eaten, and of this I will only say that it is, in my opinion and the opinion of others who have tasted it, a very tasteless vegetable indeed, and this part of the plant being only available in summer, so far not worth growing. But it occurred to me to try the root, of which nothing is said in the catalogues. This is quite unlike any ordinary Beetroot, being a branched tap-root, and quite white. The branches are about as thick as roots of Salsafy, and when cooked look exactly like this vegetable. But the flavour is totally distinct, being of a decided though mild Beetroot character, while the root is tender and succulent, and can, of course, be dug up and kept like other Beets. It appears to be a variety of Beta chilensis, having a white midrib. *Alfred O. Walker, Nant-y-Glyn, Colwyn Bay.*

PROTECTING ROSES IN WINTER.—There can be little doubt that more harm is done to Roses by heaping a lot of long litter around them in winter than by leaving them alone, more so in retentive soil and wet situations. I have kept Roses through the winter with a slight protection of dry straw and leaves, where we often had 50° below zero [32°], and never lost many—I mean, of course, of the hardier varieties; and I have grown the same varieties in England, where I had to put litter to a depth of 6 to 9 inches around them all the winter, and wrap standards and climbers up with mats. My success, however, was better in the colder climate. I have seen beds of Roses grown in kitchen gardens in the North of Scotland, where they never thought of protecting them, and very seldom had any losses from frost amongst these, no doubt the protecting material keeping the Roses in a wet state, which causes losses during the winter. *J. F. M., St. Albans.*

DIVERSE OPINIONS ABOUT PEARS AND PEACHES.—The soil at Teddington does not seem to agree with many fruits which are supposed to be fairly good in other districts. I cite a few examples from Hogg's *Fruit Manual*:—

	Hogg.	*Blackmore.*
PEARS.		
Bergamotte Esperen	A most delicious late Pear	Does not ripen well in his garden
Bési Vaet ...	A first-rate dessert Pear	Does not succeed at Teddington
Beurré d'Aremberg	Of varying merit ...	Scarcely worth growing
,, Bachelier	Large, handsome, and very excellent	Fine appearance, but very low quality
,, Bosc ...	Of first-rate quality ...	As hard as an Apple
,, Bronzé	Excellent	Never ripens
,, Diel ...	Of the highest merit ...	Of coarse texture, and vastly over-rated
,, de Jonghe	Equal, if not superior in flavour, to Marie Louise	Worthless
,, Six ...	A very fine Pear ...	Watery and insipid
British Queen	A first-rate Pear ...	Not worthy of its name
Catinka ...	Very excellent... ...	Poor and small
Citron des Carmes	Excellent early Pear, very liable to crack on its surface	Cracks and rots
Colmar ...	Old, and highly esteemed	Not worth growing
,, d'Été	Remarkably fine ...	Too small, and possessing no strong character
Comte de Lamy	Delicious	Middling quality, and not worth growing
Délices d'Hardenpont	Excellent	Useless
Doctor Nélis	Very fine	Very inferior
Duchesse d'Angoulême	Sometimes of great excellence	Very coarse, and gritty
Duchesse d'Orléans	Most delicious	Dry and insipid
Easter Beurré	Of the highest merit ...	Cracks and spots, and is seldom very good
Glou Morçeau	First-rate	Bad on a standard, and worse on a wall; flat, and loose-textured at its best. A vastly over-rated Pear, in my opinion
Marie Louise	Of the highest merit ...	Too sweet, otherwise most excellent
Nouvelle Fulvie	Of great excellence ...	Not good
Passe Colmar	Of the best quality ...	Melting, but insipid
Pitmaston Duchess	Of the finest quality ...	Good, but not of first quality; worthless on a wall
Red Doyenné	Excellent	Small, and inferior
Triomphe de Jodoigne	First rate	Very coarse
Urbaniste ...	Delicious, excellent bearer	Shy bearer, and the fruit is too aromatic
Williams' Bon Chrétien	Of the highest merit ...	Small and spotted, and the aroma is always coarse
Winter Nélis	One of the richest flavoured Pears	A good Pear, but of rather flat flavour
Zephirin Gregoire	Most delicious	Not good
PEACHES.		
Alexandra	Ripens in the middle of August, very tender and melting, juicy, richly flavoured and vinous	It is of no value here
Barrington	Tree very hardy, vigorous, and generally a good bearer	A shy bearer, and seldom ripens thoroughly
Belle Beauce	A delicious Peach; a variety of Grosse Mignonne, but considerably larger	Is apt to crack, and not to be compared to Grosse Mignonne
Belle de Doné	A handsome, melting Peach	Does not do well
Early Beatrice	Earliest Peach known; flesh melting and juicy, rich flavoured	Not worth growing
Early Louise	Although not so early, it is a larger and superior fruit to Early Beatrice	Too small, and a clingstone
Early Rivers	The finest early Peach known	A large and good Peach, but very pale, and splits even in dry seasons. On this account worthless here
Early Victoria	A first-rate early Peach	Not worth growing
Early York.	One of the best early Peaches	Does not do well
Nectarine Peach	Grown in an orchard-house, this is a very fine and handsome Peach	A bad grower
Royal George	... ...	Worthless at Teddington
Stump the World	Has not attained the excellence in this country which it is reputed to have in the United States	Utterly useless
Sulhamstead	Much resembles the Noblesse	Not worth cultivating
Walburton Admirable	A good bearer	A very bad bearer

F.R.H.S.

LATHYRUS FODDER.—In the notice of the October number of the *Kew Bulletin* in the *Gardeners' Chronicle* for December 1, 1894 (p. 665), is an error which I may perhaps be permitted to correct. The plant to whose poisonous properties recent legal proceedings made it desirable to draw attention in our *Bulletin* was not Lathyrus sylvestris, but L. sativus. Of the poisonous properties of the seeds of the latter species there can be no matter of doubt, and those of the former are open to suspicion. It is, as you say, very disturbing to hear that anything in the nature of a "pulse" is poisonous; but it must be remembered that poisonous properties are scattered up and down the family of the Leguminosæ. Abrus, whose seeds are the well-known Crab's-eyes, is nearly allied to Lathyrus. It is used in India for "sui-poisoning," a criminal method of killing cattle. The poison appears here to be a proteid. The whole tribe of Genisteæ is open to suspicion, as many of the species are known to yield the poisonous alkaloid cytisine. If my memory does not fail me, the roots of the Scarlet-runner are poisonous. *W. T. Thiselton-Dyer, Kew.*

DOUBLE CHINESE PRIMULAS.—Although double Primulas do not, as a rule, present such attractive plant features in a greenhouse during the winter as fine single forms do, yet they are, when well-grown and flowered, of singular value for furnishing cut-blooms. Those fine forms, White Lady and Marchioness of Exeter, the latter sometimes marked with carmine flakes, are usually very pure-coloured during the winter, and as the individual flowers are very large and double, they can be when gathered and wired used in bouquets, &c., with great advantage. No one in the metropolitan area grows and shows these doubles better than does Mr. Mease at Doronnde, Leatherhead. He has, chiefly in 6-inch pots, some 80 plants, averaging from 15 to 18 inches across, and when at their best carrying very massive heads of flowers. One plant alone will carry some 150 of these fine blooms during the winter; hence their value can hardly be over-estimated. The flowers of the finest, of the old alba strain, are of not one-third the size or of the purity of colour that marks the double forms mentioned. The plants were all from layered side-shoots, soil being added in the pots for the purpose during February and March, then stood in a temperature ranging from 60° to 65°, and kept watered through a fine rose. By the end of April all the layers are sufficiently rooted to enable them to be taken off, shifted singly into small pots, grown on for a time in a similar temperature, finally shifted into the blooming-pots, and stood into a frame where, during hot weather they are well-shaded with mats that are occasionally wetted to keep the frame cool. A good compost of turfy loam, leaf-soil, and silver sand suits well, and potting should be fairly firm. It is Mr. Mease's rule to use tepid water always for watering. He has won the first prizes at several local shows this autumn, as well as at the Royal Aquarium at the recent December exhibition. *A. D.*

VALUE OF GARDEN WALLS.—Years ago, when there was not so much fruit imported, and glass-houses were less common, the garden had to supply all the fruit required by the household, and, as a result, more attention had to be paid to the construction of garden walls. When at Kedleston (Lord Scarsdale's seat, near Derby), some time ago, I was much struck with the manner in which the walls were built. The kitchen garden, which is eight acres in extent, is bounded on the north, north-east, and north-west by a wall 18 feet high, built in the form of quadrants, each of which is about 20 feet in diameter, the whole forming one grand semicircle, extending from the east to west of the garden, so that there was almost every angle that could be mentioned between those two points on the wall. Inside this, and forming a sort of a chord to this great arc, is a straight wall, extending from east to west, the south side being furnished with glass-houses. The ground between these two walls is so sheltered, that though the thermometer fell to 23° Fahr. on September 28, Mr. Voss the gardener, informed me neither Chrysanthemums or Tomatos suffered in the least. The other boundary walls round the garden are 16 feet high, so that fruit trees have ample room for extension. In addition to these, there are two cross walls about 3 feet in thickness, that were at one time heated by means of flues, with such walls as these, there are space and accommodation for the cultivation of all kinds of hardy fruit. One tree was noticed in this garden carrying a nice lot of Apricots, although it was near the end of September. Mr. Voss said that he had had a wonderful crop of Apricots; Morello Cherries were also very fine. Pears were to be seen hanging in abundance, particularly on the inner sweep of the circular wall. Marie Louise, Doyenné du Comice, Glout Morçeau, Passe Colmar, Brockworth Park, and others, were fruiting remarkably. The value of such walls is apparent to anyone, affording as they do so many different aspects, thus enabling the gardener to lengthen the season of any particular variety or kind. What could be more useful than one of these high walls with a northern aspect, having a wide coping for the protecting of the trees from frost in the spring, and for enabling the fruit of Morello Cherries, late Plums, such as Coe's Golden Drop, Coe's Late Red, Grand Duke, Guthrie's Late Green, Imperial de Milan, Late Rivers, Monarch, Nouvelle de Dorelle, Pond's Seedling, Prince Englebert, White Magnum Bonum, and the like to be kept under nets till late in the season, to say nothing of the lengthening of the season of the summer Cherries? Moreover, the shade afforded the border on the north side of the wall in summer would be invaluable to prolong the Strawberry season, and enable the gardener to get juicy salads. With good soil like that of which the kitchen garden at Kedleston consists, with high walls like these, he would be a poor gardener who could not show good results. Kedleston has gone down of late years, for the gardener, Mr. Jackson, had grown very infirm before he died; and he had presided over the garden for a great number of years. Under the present gardener, who was a successful cultivator in the south before going north, there is every prospect of improvement. As an earnest of this, many of the old trees are being replaced with young ones, and the entire place is being put in good order. The immense size of the Oaks in the park indicates the fertility of the soil, for some of these are 30 feet in circumference, with clean straight trunks. Most of these Oaks are, however, decaying. Outside the garden wall was about 1½ acre of Drumhead Cabbages, which would not average less than 80 tons to the acre, this being also proof of the goodness of the soil. *H. C. Prinsep.*

A PUBLIC PARK AT TRURO.

In the illustration given on p. 731, our readers will see the form of the area included within the boundary of the new park now being made at Truro, the proposed direction of the walks, the amount of the shrubbery, and other planting, as well as the lake, &c. The land has been reclaimed from the low shores of the Fal, and is therefore somewhat low-lying, but this will doubtless be efficiently met by increasing the depth of the soil, and a thorough underground system of drainage. The plan shows extensive areas of turf devoted to sports, and breadth and openness are not lost in a too great amount of tree-planting; indeed, we should have thought that in a windy county as is Cornwall, the plantations and groups of trees, &c., might have well been rather denser and more numerous, but we have no doubt that Messrs. Veitch & Sons, Royal Nurseries, Exeter, whose landscape gardener, Mr. F. W. Meyer, designed the park, have a more adequate idea of the requirements in these respects than we can have. The plan, it will be observed, shows an esplanade and retaining embankment-wall along the river front, and a due amount of protection from trees and shrubs on the opposite side—the north. It will form, when completed, a pleasant addition to the attractions of the town.

SOCIETIES.

ROYAL HORTICULTURAL.

December 11.—Even for a December meeting, the one held on Tuesday last at the Drill Hall, James Street, Westminster, can hardly be considered other than below the average, and the awards obtained by novelties fell unusually low, only two Awards of Merit being accorded by the Floral Committee, and these to Chrysanthemums. There was a grand collection of Apples from Maidstone, but, excepting this, the exhibits before the Fruit Committee were few. Orchids, though less numerous than usual, furnished the greater number of novelties, and included several very distinct and charming hybrid Cypripediums.

Floral Committee.

Present: W. Marshall, Esq., in the chair; C. T. Druery, J. H. Fitt, H. B. May, R. Dean, G. Stevens, W. C. Leach, R. Owen, C. J. Salter, C. F. Bause, Geo. Gordon, T. Godfrey, J. D. Pawle, E. Mawley, C. E. Shea, H. J. Jones, C. E. Pearson, J. Walker, H. H. D'Ombrain, G. Paul, and P. Barr.

Messrs. Jno. Laing & Son, Forest Hill Nurseries, S.E., staged a very pretty group of miscellaneous plants, which in the sparsely-filled hall greatly helped to make such display as was furnished. Well-grown plants of Dracænas, Palms, Crotons, &c., were interspersed with Bouvardias, Ericas, Cyclamens, and Poincettias. The new decorative Dracæna, Lord Roberts, Nicotiana affinis variegata, and some Cypripediums in bloom, were also remarked (Silver Flora Medal).

A large exhibit of cut Chrysanthemums was made by Mr. Robert Owen, Castle Hill Nursery, Maidenhead, including about 150 blooms, and representing in a large degree new English Seedlings. Awards of Merit were obtained by King of Plumes, a first-rate yellow decorative variety, with forked petals, and Bellem, a large globular-flowered Japanese incurved. It has broad petals, and is a pretty cream-colour, going to slight rose. [These two varieties were, as we learned from the Secretary, awarded First-class Certificates by the National Chrysanthemum Society, at whose meeting on Wednesday 12th inst., they were exhibited.] Amongst other good flowers were Madame Royaine, a rose-coloured Japanese incurved, rather flat, with long petals; Challenge, and Col. Bourne (Silver Flora Medal).

Mr. Herrin, Dropmore Gardens, Maidenhead, exhibited sprays and cones of the following Conifers, Pinus Lambertiana, with three large cones; Araucaria imbricata with female cones as large as a good Cocoa-nut; Abies nobilis, with three handsome cones on a spray, the cones about 9 inches long; Cupressus Goveniana, with numerous pretty little cones; and Cupressus sempervirens, also Cedrus atlantica, Cedrus Deodara, and Sequoia gigantea (Silver Banksian Medal).

Examples of plants growing in Jadoo fibre were exhibited by C. Halford Thomas, Esq., East Cliff, Teignmouth, including such plants as Primulas, Cinerarias, Cyclamens, Asparagus, Begonias, and Bouvardias.

Mr. Moore, of the Glasnevin Botanic Gardens, exhibited several interesting specimens, including two scapes of Nerine Manselli, a hybrid from N. flexuosa and N. Fothergilli. The large trusses of flowers were very showy, being a bright rose colour. Also flowers of Iris stylosa alba, and Bilbergia Windii, the latter a hybrid from B. decora × B. nutans.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Secretary), Dr. M. T. Masters, E. Hill, H. J. Chapman, H. Williams, W. H. White, H. Ballantine, H. M. Pollett, Walter Cobb, and A. H. Smee.

At this, the last meeting of the year, exhibits were neither so numerous or so good in quality as has been observed at previous meetings, though a few remarkably good things were staged. One of the finest of these was a noble spike of Cymbidium Tracyanum, with immense flowers, sent by Baron Schroder, The Dell, Egham (gr., Mr. Ballantine), and which was illustrated in the *Gardeners' Chronicle*, January 31, 1891; C. grandiflorum, between which and C. giganteum it is probably a natural hybrid, being illustrated by us, February 27, 1892.

The Right Hon. Lord Rothschild, Tring Park, Tring (gr., Mr. E. Hill), sent the beautiful Cattleya guttata Prinzii, Vicomte de Figueirado; a splendid form of the plant, known in gardens as C. amethystoglossa, but with creamy-yellow flowers blotched with purplish-crimson, and with a very showy crimson front-lobe to the lobe to the lip (Award of Merit).

The Duke of Westminster, Eaton Hall, Chester (gr., Mr. Barnes), sent flowers of Cattleya labiata Princess Adolphus, a very showy and richly-coloured form, with cream-coloured blotches on each side of the dark crimson lip.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed Epidendrum × Wallisio-ciliare (Wallisii ♂, ciliare ♀), a very singular-looking and pretty hybrid, with flowers having yellow sepals and petals, and a white labellum, with yellow crest, in front of which are some fine purple lines. The lip is delicately fringed, and the whole flower very singular and attractive. Messrs. Veitch also showed Cypripedium × Sirius (Godefroyæ ♂, barbatum Crossii ♀), with white flowers tinged with rose-purple, and with thin rose-purple lines. In the plant shown the upper sepal had two smaller lateral blades, one on each side, at the base, a singular freak which may be constant. C. × minosa (Spicerianum × Arthurianum) with rather small flowers spotted with

dark purplish-brown. C. × Zeno (insigne Chantinii ♂, altens ♀) and a fine variety of C. × Niobe were exhibited by the same firm.

E. Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Hollerook), showed Cypripedium × Swinburnei magnificum (Argus-Moensii × insigne Maulei), a noble variety differing from the original in its larger flowers, and in the nearly black blotching of the petals, which are as showy as those of C. Argus-Moensii (Award of Merit).

T. W. Swinburne, Esq., J.P., Comdean Hall, Winchcombe (after whom the plant was named), also exhibited C. × Swinburnii magnificum and received an Award of Merit for his plant.

Messrs. F. Sander & Co., St. Albans, staged a neat group of Orchids, containing several and various forms of Dendrobium Phalænopsis Schroderianum, Lælia autumnalis atrorubens, and L. a. alba; L. furfuracea, Catasetum Christyanum, Restrepia antennifera, Stenia pallida, Cattleya Wallisiana, Cypripedium radiosum superbum, C. × J. Bartels (Boxalli × callosum); C. × Albert Truffaut (Harrisianum vivicans × Spicerianum); C. × Pryorianum (Harrisianum superbum × Lathamianum; C. × Hollidayanum (concolor × almum); C. × maculatum (tonsum × Leeanum), with very bright purple-flushed flowers; and various Orchids of botanical interest only.

T. Statter Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed the pretty Lælia × Euterpe (crispa × pumila Dayana), a very compact plant, and free to flower (Award of Merit); Lælio-Cattleya × Tresederiana (L. crispa superba × C. Loddigesii), an attractive flower, approaching L. crispa; Cypripedium × Ariadne, and the singular pale-coloured C. × Leeanum albens.

Messrs. Heath & Son, Cheltenham, showed Lælia Tresederiana pallida, in which the labellum is of a light rose-pink.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., staged a group of Orchids, in which were one of the original specimens of Cypripedium × Sallieri, with about a score flowers; a good example of their apparently perpetual flowering C. × Pitcherianum, Williams' variety; C. × Leeanum, C. × Harrisianum superbum, C. villosum, C. × Meirax, Lælia autumnalis atrorubens, L. anceps Williamsii, Cœlia bella, Oncidium cheirophorum, O. (not Lælia) prætextum, O. Forbesii. &c. (Vote of Thanks).

Messrs. Hugh Low & Co., Clapton, arranged an effective little group of Cypripedium Charlesworthii, C. × Leeanum superbum, C. Harrisianum superbum, and other Cypripediums; Lælia prætans, &c. With them were the curious little Cypripedium × Argus-Spicerianum, and the new Schomburgkia rhinodora var. Kimballiana, which somewhat resembles a tall, few-flowered spike of Cattleya Bowringiana, the colour of the flowers being of the same purple hue, but the lip is open, and not rolled over the column (Award of Merit).

Mr. P. Weathers, Silverhall Nursery, Isleworth, showed Cypripedium × William Lloyd (bellatulum × Swanianum) a beautiful, and richly-coloured hybrid, with some resemblance to C. × Chas. Richman, in the dark rose and crimson colour which suffuses almost the whole of its surface. The substance of the flower is thick and wax-like, and the broad upper sepal has feathered crimson-purple lines (Award of Merit). Mr. Weathers also showed C. × Gravesiæ, white, with small purple dotted lines, and with little of the dark marking shown on the original variety, illustrated in the *Gardeners' Chronicle*, March 10, 1894, p. 299. F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin, Dublin, showed Platyclinis uncata, Masdevallia velifera, and M. Peristeria (Botanical Certificate). Walter Cobb, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howe), showed Cypripedium × J. Howe (Sallierii × villosum aureum). The flower is an improvement in size and colour on C. × Sallieri Hyeanum, which in other respects it resembles.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), showed Vanda Bensonii anchorifera, and the singular Bulbophyllum mandibulare (Botanical Certificate). W. C. Walker, Esq., Winchmore Hill (gr., Mr. G. Cragg), sent Eulophia megistophylla. A. H. Smee, Esq., The Grange, Wallington (gr., Mr. Cummins), showed Amblostoma tridactylon, and a light form of Cypripedium × Ashburtoniæ. S. G. Lutwyche, Esq., Beckenham (gr., Mr. Paterson), showed Cypripedium insigne, C. Dayanum, C. Curtisii, Dendrodium × endocharis, and a fine form of D. Phalænopsis Schroderianum.

Fruit Committee.

Present: T. F. Rivers, Esq., chairman; and Messrs. Geo. Bunyard, J. H. Veitch, P. C. M. Veitch, W. Wilks, G. W. Cummins, T. J. Saltmarsh, J. Wright, A. Dean, J. A. Laing, W. Bates, C. Ross, J. Hudson, C. Herrin, H. Balderson, F. Q. Lane, Geo. Wythes, J. Smith, G. Norman, J. Willard, and Arnold Moss.

Messrs. George Bunyard & Co., Maidstone, staged a magnificent collection of culinary Apples in about 100 dishes. They were of fine quality, and good colour. Dishes especially noticeable, either from their size or colour, were Baumann's Reinette, Lord Grosvenor, Queen Caroline, Grantonian, Bismarck, Gascoigne's Scarlet Seedling, Flanders Pippin, Lady Henniker, Tyler's Kernel, Golden Spire, Wadhurst Pippin, Mrs. Barron, Peasgood's Nonsuch (very fine), Lord Derby, Gloria Mundi, Osborne's, Newton Wonder, Warner's King, &c. (Silver-gilt Knightian).

From Mrs. Wingfield, Ampthill, Beds (gr., Mr. Empson), came nine bunches of well-grown Gros Colmar Grapes, and three bunches of Golden Queen (Vote of Thanks).

Six fruits of a seedling Melon called Belmont Favourite were exhibited by C. A. Hanbury, Esq., Belmont, Eastbourne, gr., Mr. Porteous. The fruits

FIG. 92.—DESIGN FOR PUBLIC PARK AT TRURO, CORNWALL. (SEE P. 730.)

were of pale colour, green flesh, but the present date of season is against good flavour in all Melons.

Mr. Chas. Herrin, from the gardens at Dropmore, exhibited a dish of Farmer's Seedling Apples, a medium-sized culinary variety, rather conical in shape.

Messrs. Cooper, Taber & Co., 90, Southwark Street, London, S.E., exhibited two dishes of new American varieties of Potatos, Carmen No. 1 and Carmen No. 3. The first-named are described as early, and the latter late. The tubers, particularly the last-named, were large, white, and in shape rather long and flat.

From the Royal Horticultural Society's Gardens, at Chiswick, came a dish of Beurré Sterckmann Pears.

Mr. A. G. Nichols, Nuneham Park Gardens, Abingdon, showed branch and fruits of a Cucumber called White Spine Winter Cucumber, an old variety, but said to be a capital one for winter-fruiting. Apparently it is very free, and possesses a very deep colour.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., exhibited plants in pots of Tomato Warden Park Favourite, recommended as a good one for winter forcing. The fruits are rather small as shown, and corrugated.

TRENGWAINTON, CORNWALL.

This is the name of a richly-wooded property near Penzance, belonging to Mr. J. Robins Bolitho. The flower gardens near the house do not call for particular notice, except for the lovely views (obtainable from the terrace on the south side of the building), of Mount's Bay and St. Michael's Mount. But the fruit and vegetable gardens, with the orchards which surround them, have many points of interest, and cover nearly 5 acres. When these gardens were originally laid out, two walls were built about 18 feet high, 468 feet long, 78 feet apart, and running east and west. Between these tall walls are four others about 6 feet high, which run north and south, and divide this part into five equal areas. On the western side of each of these shorter walls is an inclined bed of earth, beginning at 16 feet from the base of the wall and going up to the top. An old labourer on the estate, now ninety-four years of age, remembers these walls being built about the year 1814, upon what was then an open moor, much exposed to south-westerly gales, and says that these inclines were planted with Hornbeams as screens. About the same date the grounds surrounding these gardens were planted with Beech, Plane, Ash, and Elm; and as these trees grew (being now generally about 80 feet high), the need for the Hornbeams ended, and they were in due course removed. It is somewhat singular that not a single specimen of Hornbeam can now be met with anywhere near. These inclined beds are now devoted to Strawberries, to Violets, and to other flowers of which the gardener, Mr. S. Clarke, is often called on to furnish large supplies for bazaars and other charitable purposes, and for church decoration.

Notwithstanding the very unusual amount of frost which was experienced here last spring, 14° having been registered, there are some very interesting plants in one of the compartments of this garden. Embothrium coccineum, the Flame Tree, 20 feet, had a few blooms on it on August 10, and had evidently flowered well, as there were plenty of seed-pods on it, nearly ripe. A fine tree of Acacia dealbata had been nearly killed, but was breaking out again at 2 to 5 feet from the ground. Erica australis, 8 feet; a Podocarpus, 10 feet; Olearia Haasti, 10 feet; and Leptospermum baccatum, 12 feet, were noteworthy. There are also enormous clumps of Bambusa Metake and Arundinaria falcata, both of great height. There was likewise a plant of Chimonanthus with many fruits on it, each 3 inches long, and with leaves much larger than the usual size of C. fragrans. Against the walls were Trachelospermum (Rhynchospermum) jasminoides, 5 feet, flowering freely; Solanum jasminoides, covered with blooms up to 15 feet; Habrothamnus coccineus, Coprosma Baueriana, and many other things usually treated as stove or greenhouse plants in other parts of the country.

There is a tradition in the neighbourhood that the part of these gardens between the high walls was intentionally arranged to represent the size of Noah's ark. Now, the ark was 300 cubits long by 50 cubits wide; and as the cubit is usually taken to be 16 inches, this would give 400 feet by 67 feet as its dimensions. But, as will be noticed from the measurements already given, the enclosed part of the garden is somewhat larger than this. It is, however, somewhat singular that the actual length and breadth of this part are in exactly the same proportions as the Biblical measurements. We have, therefore, only to suppose that the designers or builders of these walls considered the length of a cubit to be 18¾ inches, to give us ground for thinking that there may have been some foundation for the tradition. *W. T., Hea Moor.*

FLORISTS' FLOWERS.

NEW CHRYSANTHEMUMS.

Whilst all interested in the Chrysanthemum must feel some sense of relief that the busy and exciting season of exhibitions is over, they may yet be much troubled with regard to the difficulty of selecting the best of the novelties so-called, but not always so, that have through the granting of certificates, &c., been placed in very prominent positions. Every grower likes to have a few new sorts each year, and every exhibitor must do so, or else he would soon find himself left behind by others. The annual increase in new Japanese sorts seems to be at the rate of about 30 per cent. on the whole, when all the lists of home, French, and American sorts, are brought together. Of this number perhaps some 5 per cent. get certificates awarded to them, so that the growth is enormous. With no other exhibition flower is there anything like the same increase. Roses, Dahlias, Carnations, Auriculas, come slowly, and it it is easy to keep pace with them. The increase in Chrysanthemums is bewildering. Thus the selection by private growers from the numerous trade lists of even the best of the novelties becomes a severe tax on one's judgment as well as pocket. Unfortunately the novelties are not always pleasing additions, but because large they elbow out from cultivation many smaller, yet more beautiful varieties. Thus our progress in Chrysanthemum production is by no means all gain. Certificates generally are granted from the exhibition point of view. Rarely, perhaps never, are decorative considerations regarded, so far as relates to the large-flowered section; were a selection made of twenty-four Japanese varieties for elegance and refinement of flowers not a few of the favoured exhibition ones would be excluded. Their merit is that they fill the board, and judges seem to detest voids on show boards. *A. D.*

The Carnation.

Before saying anything about the border Carnations, I may advert to some remarks made by J. B. Crichton at p. 674. The system of propagation given there is that usually practised for border Carnations. Plants layered in July and August would not flower in the late autumn and winter months, but it is at that season of the year that the flowers are wanted. I well remember some years ago, when some conversation arose on certain points of culture of the Carnation, at one of the National Society's exhibitions; one enthusiastic amateur exclaiming, "Do not tell me how to get Carnation blooms in summer. I want to know how to get them in winter!" Just so. In the first place, good varieties must be grown, and such as flower well at midwinter. Tree Carnations cannot very well be propagated by layering. As the name implies, they take the "tree" form, by shooting out from the stem, forming side branches. These grow and flower, and again form lateral growths, and none of these can be bent down to the surface of the ground to be layered. I have in years gone by described how to obtain a succession of flowering plants, but in a month it will be necessary to put in the cuttings or slips for the earliest batch of plants, and at that early season of the year they require both bottom heat and the temperature of a forcing-house, the minimum of which is 50°, the bottom-heat being from 75° to 80°, and a uniform temperature maintained. Fermenting material heats violently for a few days, and rapidly subsides again, rendering thick dung lining necessary, which is a kind of work that takes up much time, and is laborious. The bottom-heat should be, if possible, afforded by hot-water, as being not liable to much fluctuation, and easily maintained at the right heat. A small frame or hand-light, or something similar, must be put over the bed, so as to keep the slips in a plump condition till roots form. Some varieties form roots very readily, and scarcely require this aid, whilst others are stubborn and linger long in the cutting state. Owing to this peculiarity, it is good practice to put one variety only in a flower-pot. As fast as the cuttings form roots and are self-supporting, they must be removed from the bottom-heat and placed on a shelf near the glass-roof of the house, and after a few days they should be potted off into what are termed thumbs. The smaller and tenderer side-growths form roots more readily than others, and such, of course, when rooted, do not need even small sixties to start with. Keep the potted-off plants on the shelf till they are established, when they will be able to stand the temperature of a greenhouse. It is well for tyros to remember that a young Carnation will not remain healthy if kept for a long time in a hothouse. From the greenhouse the plants pass into cold frames, and ultimately out of doors. Cuttings for succession may be taken as late as May. Those earliest propagated begin to flower about the end of the month of September, and a succession can be maintained throughout the winter and spring. The potting-soil for the rooted cuttings and young plants should consist of a little peat, loam, leaf-mould, and sand. *J. Douglas.*

SCOTLAND.

ORCHIDS AT OSWALD HOUSE, EDINBURGH.

A visit to the gardens at Oswald House, the property of J. Buchanan, Esq., which lies at the outskirts of the town, is always of interest to orchidists, and although at this time of the year a gay display is not to be expected, yet several good plants were remarked as being in flower, notably an excellent plant of C. Leeanum, carrying some finely-coloured flowers, C. Warneri, C. cardinalis, C. Amesianum, C. Dominianum, and others. These plants have possessed leaves and flowers of remarkable vigour and size. In the same house a fine flower-spike of Lælia superbiens was remarked still undeveloped, which promised a good lot of flowers shortly. Cattleya labiata in several shades of colour was brightening the house with its rosy-purple flowers. Plants of Cattleya gigas Sanderiana were very vigorous, and Lælia albida, L. anceps, and the variety L. a. Scottiana, were carrying heavy flower-spikes. Amongst the cool Orchids many interesting plants were to be noted. Two fine baskets of Nanodes Medusæ, a difficult subject with some growers, grows luxuriantly here in a cool greenhouse under Mr. G. Wood's care. Large plants of Cœlogyne cristata are well set with flower-spikes. The Odontoglossums also look well, and cleanliness is everywhere observed. The greenish-yellow flowers of Odontoglossum Uro-Skinneri were showing freely, and O. bictonense, and Oncidium incurvum were noted, the graceful spikes of the latter being conspicuous objects. Plants of Masdevallia Chimæra and M. tovarensis were flowering freely, and a strong plant of Lycaste Skinneri had thirteen flower-spikes, and the rarer L. Skinneri alba too, showed signs of flowering. The sweet-scented Cymbidium sinense and Pilumna fragrans gave out their delightful perfume. Angræcums, Vandas, Aërides, were represented by large specimens the very pictures of good health, and this varied collection reflected much credit upon Mr. Wood's methods of culture. *H.*

PLANT PORTRAITS.

Anguloa Madouxiana×.—A cross, as is supposed, between A. Ruckeri and A. uniflora. *Lindenia*, t. cdxxxiv.

Anthurium Crombezianum × André.—A cross raised at Cannes between a hybrid of A. Andreanum and A. Scherzerianum, the latter being the pollen parent. Leaves deeply cordate, with rounded lobes, ovate-acuminate; spathe reflexed, crimson; spadix erect, cream-coloured. *Revue Hort.*, December 1.

Apple (Reinette) Descarde, *Revue de l'Horticulture, Belge*, November.

Azaleas.—1, La Tsarine, lilac; 2, Nicholas II, orange (mollis × sinensis). *Revue de l'Horticulture Belge*, December.

Brugmansia chlorantha and B. cornigera, *Garden*, November 17.

Calla Elliottiana — *Garden*, November 24.

Calochortus venustus roseus.—C. Vesta, C. V. purpurascens. *Garden*, November 17.

Cattleya Mossiæ var Wambekeana. A fine form of Mossiæ, with a lip resembling that of Dowiana or gigas. *Lindenia*, t. cdxxxiii.

Chorozema Lowii ×, hort.—A hybrid raised in England between C. elegans and C. ilicifolia. *Revue de l'Horticulture Belge*, December 1.

Cornus florida rubra, *Revue Horticole*, Nov. 1.

Crab-Apple, General Grant, very productive, handsome, and of good quality. *Canadian Horticulturist*, November.

Cypripedium Godefroyæ Godefroy, var. leucochilum, hort. *Lindenia*, t. 431.

Double Lilac, Michael Buchner, *Gartenflora*, t. 1409, erroneously labelled as L. Maxime Cornu.

Gentiana crinita, Froelich, *Mehan's Monthly*, November.

Hydrangea Lindleyana, *Garden*, Dec. 1.

Iris Leon Tolstoi, *Garden*, November 10, 1894.

Lælia autumnalis var, *Dictionnaire Pratique d'Horticulture*, liv. 32.

Lælia purpurata, Lindl. var. Comte de Montebello, Linden. Sepals and petals milk white, lip rich purple. *Lindenia*, t. cdxxxv.

Masdevallias: elephanticeps, fractiflexa, hieroglyphica, Mooreana, muscosa, ophioglossa, pachyantha, striatella, ventricularia, Wendlandiana, all figured in Part 6 of Miss Woolward's *The Genus Masdevallia*, issued by the Marquis of Lothian.

Odontoglossum cordatum, Lindl., var. aureum.—Perianth segments lanceolate, yellowish; lip white, halberd-shaped; with a long acumen. *Lindenia*, t. 430.

Odontoglossum crispum var. ocellatum.—Perianth segments white, thickly beset with small crimson spots between the margins and the centre. *Lindenia*, t. 429.

O. Pescatorei, Lindl., var. Chaberiæ, Linden.—A form with the lip of a rich purple colour. *Lindenia*, t. 432.

Osmunda Claytoniana, *Mehan's Monthly*, October, 1894.

Pear Alessandro Lambre, *Giornale d'Agricultura*, November.

Pear, Souvenir du Congrès, *Canadian Horticulturist*, October.

Phœnix melanocarpa, *Revue Horticole* Nov. 1.

Rose, Paul's Carmine, *Garden*, Oct. 27.

Vriesea Rex, *Revue de l'Horticulture Belge*, November.

BOOK NOTICE.

"PHYSICAL AND CHEMICAL PROPERTIES OF SOILS"*

A useful little treatise has recently issued from the pen of Prof. R. Warington, F.R.S., on the "Physical and Chemical Properties of Soils."

This subject being very slightly treated in most English text-books, the pamphlet is written to supply a temporary want, and with the view of enabling teachers of agricultural and horticultural classes to do fuller justice to this part of their subject. In speaking of the "Relation of Soil to Water," the author says:—"The influence of humus on the capacity of a soil for water is remarkable. The surface soil of the experimental wheat-field at Rothamsted, which was sampled in January, 1869, when saturated with water, the unmanured land contained 32·4 of water per 100 of dry soil; the land manured with farmyard manure for twenty-six years contained 65·8 of water per 100 of soil.

"Thus the humic matter of soils is of great horticultural importance; not only does it profoundly modify the physical properties of soil, it is also the principal source of the nitrogenous food of plants. A soil rich in humus is rich in nitrogen. A soil poor in humus is poor in nitrogen. An old pasture at Rothamsted, with plant-roots removed, contained when dry, in the first 9 inches of depth, 0·245 per cent. of nitrogen, and 3·36 per cent. of carbon, corresponding to about 5·6 per cent. of humus.

"In very rich English pastures the percentage of nitrogen will reach 0·5 or 0·6. The soil of old kitchen gardens will reach a similar amount.

"It is stated that the proportion of plant-food present in soils is very small, even when the soil is extremely fertile, the bulk of the soil serving chiefly as a support, and as a sponge to hold water.

"A good arable soil may contain 0·15 per cent. of nitrogen, 0·15 per cent. of phosphoric acid, 0·2 per cent. of potash, 0·5 per cent. of lime; much larger quantities may, of course, occasionally be present.

"The weight of soil on an acre of land is so enormous that small proportions of plant-food may amount to very considerable quantities. Supposing, therefore, a dry soil to contain one-tenth of a per cent. of nitrogen, phosphoric acid, or potash, the quantity in nine inches of soil will be from 2,250 lb. to 3,500 lb. per acre.

"A large part of the elements of plant-food contained in soils is present in such a condition that plants are unable to make use of it. An acre of soil may contain many thousand pounds of phosphoric acid or of nitrogen, and yet be in a poor condition; while a dressing supplying 50 lb. of readily available phosphoric acid or nitrogen, in the form of superphosphate or nitrate of soda, may greatly increase its productiveness.

"The available condition of the plant food depends much on the character of the soil; a much smaller proportion of plant food will render a sand fertile than would be required in the case of a clay. This is due in part to the far greater development of the roots in a sandy soil, and to the different condition in which the mineral food is held.

"Food can be taken up by the roots of plants only when it is in solution, or in a condition capable of being dissolved by contact with the acid sap of the root-hairs. Matter which is in neither of these conditions is useless to the plant, though it may afterwards become available by the chemical action within the soil. Most of the ingredients of soil are in an insoluble condition; this fact is really of the utmost advantage, especially to those who cultivate under glass, and in pots, or else soils would lose their fertility by the frequent heavy waterings to which they are necessarily submitted."

These few notes touch only briefly the subjects treated upon, and we can confidently recommend the work to those for whom it is specially intended.

* Published by Chapman & Hall, Ld, London.

MARKETS.

COVENT GARDEN, December 13.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

There has been, during the week, a general run on first-class Potatos at an advance of 5*s.* to 7*s.* 6*d.* per ton. The best samples off Dark soils have also commanded quick sales and better prices than last week. *J. B. Thomas.*

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Above (+) or below (—) the Mean for the week ending December 8.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week. The districts indicated by number in the first column are the following:—
0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 8, is furnished from the Meteorological Office :—

"The *weather* continued fair and dry over the Kingdom generally, but towards the end of the period the condition became less settled, and some rain was experienced in nearly all places. A good deal of mist or fog prevailed at times—especially at the inland stations.

"The *temperature* was slightly above the mean in 'Scotland, N.,' and just equal to it in 'Scotland, W. and Ireland, S.;' in all other districts it was a little below the normal. The highest of the maxima were recorded either near the beginning or the end of the period; they ranged from 55° in 'England, S.W.,' and 54° in the 'Channel Islands,' to 46° in 'England, N.E.' The lowest of the minima were registered, as a rule, either on the 4th or 5th, and ranged from 16° to 21° in Scotland, from 23° to 27° in Ireland, and from 21° to 26° over England. In the 'Channel Islands' the lowest reading was 28°.

"The *rainfall* was much less than the mean in all districts.

"The *bright sunshine* varied considerably in amount, but was generally above the mean in the west and south, and below it in the east. The percentage of the possible duration ranged from 5 in 'England, N.E.,' 10 in 'Scotland, E.,' and 11 in the 'Midland Counties and Ireland, N.,' to 22 in 'Scotland, N.,' 26 in 'Ireland, S.,' and to 39 in the 'Channel Islands.'"

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

ADDENDA.—In our report of the National Chrysanthemum Society's exhibition at the Aquarium last week, we omitted to give the name of Mr. Carlisle of Watford as the winner of the 1st prize in the class for six cut blooms of Japanese Chrysanthemums.

AMERICAN BLIGHT ON APPLE TREE: *A. B.* Petroleum emulsion as sold by the sundriesmen; or soap-suds and petroleum, a wine-glass of the latter to one gallon of the former, as a winter dressing. The roots should be uncovered, and soap-suds (no petroleum) applied heavily, returning the soil over the roots. Dabbing the hiding-place of the aphis after denuding the trees of the rougher portions of the bark with whale-oil or brine is effective.

APPLE TREES AND MOSS: *A. B.* Dressing the trees with quick-lime as powder when they are wet with rain or dew. It may require more than one dressing if moss infests the trees very much. Whitewashing with lime is effectual, but the wash stays on the trees too long, and is therefore objectionable on the score of appearance.

APPLES (DESSERT) 12, AND PEARS (DESSERT) 12, FIT FOR CULTIVATION IN IRELAND: *Kerry.* Apples: Irish Peach, Summer Strawberry, Jennet Moyle, Court Pendu Plat, Margil, Red Astrachan, Yellow Ingestre, Cox's, Kerry, Ribston, Sturmer, and King of Pippins. The varieties which make shoots of moderate length, *i.e.* short jointed wood, which matures in a short summer, and which are therefore not so much affected by wind as long jointed shoots would be, are the best for Ireland. Pears: Swan's Egg, Dunmore, Napoleon, Thompsons, *Louise Bonne, *Jersey Gratioli, *Beurré d'Aremberg, *Doyenné du Comice, *Jargonelle, *Winter Nelis, Glout Morceau, *Knight's Monarch. Those with an * would be the better for being grown on a wall or fence, or if as bushes, in some warm sheltered enclosure.

BOOKS: *Grove.* The best books for a student of the science and art classes are Dr. Scott's *Introduction to Structural Botany*, 1894; and Henfrey's *Elementary Course of Botany*, 4th edition; published by Van Voorst, Paternoster Row, E.C.—*K. B.* The book that you enquire about is published by John Murray, Albemarle Street, Piccadilly, London.

CORRECTION. — WATER-TIGHT STOKEHOLES. — An obvious error has crept into my notes at p. 701, middle column, half-way down. The correct rendering should read thus:—"The width of the hole must be sufficient to permit of two 9-inch walls, one on each side." *E. H. J., Hampton Hill.* —In our last issue, under the heading "Fruit and Fact," p. 701, Mr. D. T. Fish desires us to state that in the fourth line from the end it should read 6*d.* per quarter peck instead of 64*s.* per quarter.

DEPOSIT IN BOILER: *D. R. Dixon.*—A substance called by the trade name of Anti-incrustator is sold by some of the London horticultural sundriesmen, which is good for the purpose of dissolving the incrustations on the inner surfaces of hot-water boilers.

FRUITING OF STEPHANOTIS FLORIBUNDA: *J. H.* The fruiting of this stove plant is not uncommon. It is not edible—is, in fact, poisonous. Some of the seeds might grow.

INSECT: *R. Grafe.* The scale is Ischnaspis filiformis, Douglas, found on various Palms and other plants, chiefly in tropical America. *R. McL.*

LARCH SEED: *Larix.* The seed may be safely extracted by drying the cones on a timber kiln, brick or metal covers being unsafe. The cones should be placed on the wooden cover to a depth of 6 inches, and the temperature raised to 100° F. They will be sufficiently dry and brittle in about ten hours, and should be turned twice in that period of time. The cones should then be placed on a smooth floor of earth, stone, or brick, and thrashed to pieces with a flail. The seed must be sifted from the *débris* of the cones, and kept in a dry place till towards the end of April, when it should be sown after steeping it in water for a few hours. The land should have been manured for some previous crop, and should be thrown into 4-feet beds, with 1½ feet alleys between. The weight of seed for sowing four lineal yards of a bed of this width is 1 lb., which will produce 14,000 to 15,000 plants. The seed should be covered to a depth of ¼ inch.

LILIES: *Contich.* Lilium longiflorum and its variety Harrisii, will force well if potted early in the autumn, or in undisturbed masses in large pots if top-dressed with rich soil, and the drainage put in proper order. L. candidum will bear slight hastening into flower after showing its buds, but L. umbellatum, L. dahuricum, L. Chalcedonicum, and L. auratum, are not good forcers. Much may be done in getting late bloom in the autumn by imbedding, as the Japanese do, the bulbs in balls of clay, and keeping them cool and at rest as long as possible. The "Chinese Fairy Lily" is not a Lily at all, but a variety of Tazetta Narcissus. When Lilies are forced, the cultivator must wait till the roots have permeated the soil thoroughly, and the first stages should be very gradual, not higher than 50° at night and 60° by day, but when the flowers show these figures may be increased 10°, remembering that the higher the degree of warmth employed at the flowering stage, the more evanescent the blooms. Lilies received at this season may be potted at once, or embedded in cocoa-fibre refuse out of doors, or in cold frames in close order.

MUSHROOM GROWING FOR MARKET: *A. B. J.* As yet good remunerative prices are obtained for the produce at all seasons, and we believe that they might be made more plentiful, even should the returns to the grower be somewhat less. They are too dear for middle-class households. The best kind of structure for cultivating Mushrooms in is one that, being wholly or partly under the ground-level, is economical in the matter of heating. If such a place be of sufficient width for two or three tiers of stone or slate shelves or benches, on either side of a broad central path, so many beds will be accommodated at one time, and a certain number of them in the process of cooling down to proper temperature for "spawning," that the warmth of the air will attain 55° to 60°, and no higher degree is required or desirable—that fire-heat becomes needless except in severe winter weather. Mushroom sometimes sell at £1 per bushel wholesale, though, as a rule, it is one quarter lower. If you engage in the business largely, it might be profitable to make the Mushroom spawn at home. A good manual on the subject of making the spawn and cultivating the esculent indoors and out-of-doors, will be found in Mr. Wright's *Mushrooms for the Million*, published at 171, Fleet Street, E.C.

NAMES OF PLANTS: *J. B. S.* Maxillaria punctata.—*R. G.* Ouvirandra fenestralis, the Lattice-plant native of lakes in Madagascar. — *B. N.* Spiræa Lindleyana.—*J. H. B.* 1, Gymnogramma ochracea; 2, Adiantum Pacotii; 3, Nephrodium molle; 4, Adiantum gracillimum; 5, Pteris tremula; 6, Pteris cretica albo-lineata. — *Pro bono publico.* Cannot name from leaves only. A Willow, probably.—*D. S.* Prunus serotina (N. America).

PHALÆNOPSIS SCHILLERIANA, AND OTHERS BRANCHING FROM THE CHIEF FLOWER-SPIKE: *Constant Reader.* Branching commonly takes place if through any cause the flowers first formed drop off, either in bud or later; moreover, branching is natural to these plants. Fog will cause a fall of the flowers, so will a low temperature and errors in cultivation. Probably the secondary growths will flower satisfactorily in the spring. The temperature should be a little higher at this season, and during January and February, than that which is suitable for the plants in the stove in which they are now standing, viz., 60° to 65° at night, and 65° to 68° in dull weather, with a slight advance over the highest figure in sunny weather.

PHOTOGRAPHS: *W. B.* We do not undertake to return these unless we are specially asked to to so; and we have none in our keeping of the years 1891 and 1892.

POINSETTIA SEEDING: *W. B.* The seeding of this plant is, we believe, an unusual occurrence.

POLYGONUM SACHALINENSE: *W. R. & L.* Immensely productive. You can obtain sets by advertisement in our columns.

RATING OF MARKET GREENHOUSES: *Overrated.* See answer in our last issue in Notices to Correspondents.

RED PLUM: *C. W. de Heger.* Probably Prunus myrobalana is meant.

TAR DRESSING FOR VINES: *A. B.* A pint of gas-tar to three gallons of dry powdered clay, mixing together with 1 lb. of soft soap and some soot to give colour to the substance, reducing the mixture to the consistency of thick paint, by adding warm water. There are other formulas, but the above is safe in the using, and effectual as a dressing for mealy bug.

VINES: *B. G.* The soil is by no means in bad condition, but the appearance of some of the roots sent points to the stagnation of water in the soil. Look to the drainage. There was no fungus on the roots.

JONES & ATTWOOD
STOURBRIDGE

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20*s.*

If set across three Columns the lowest charge will be 30*s.*

Page, £8; Half Page, £4 10*s.*; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d.

SEED TRADE.—Advertiser, age 21, seeks a situation as ASSISTANT. Five years' experience in all branches. Good references.—A. J. P., Messrs. Robert Veitch & Son, Exeter.

MAN'S INGRATITUDE.—We have it on Shakespeare's authority that the winter wind is not more unkind than man's ingratitude. In many cases this is unfortunately only too true. There are times, however, when the benefit received is so great that ingratitude becomes impossible. When life is rendered a burden to us by sickness, and someone comes and restores us to health, we should be base indeed to feel ungrateful. Thus, millions are to-day grateful to HOLLOWAY'S PILLS and OINTMENT, which have cured them of all stomach and liver troubles, banished headache, flatulency, indigestion, and low spirits, and cleared their systems of gout, rheumatism, sciatica, and all similar ailments.

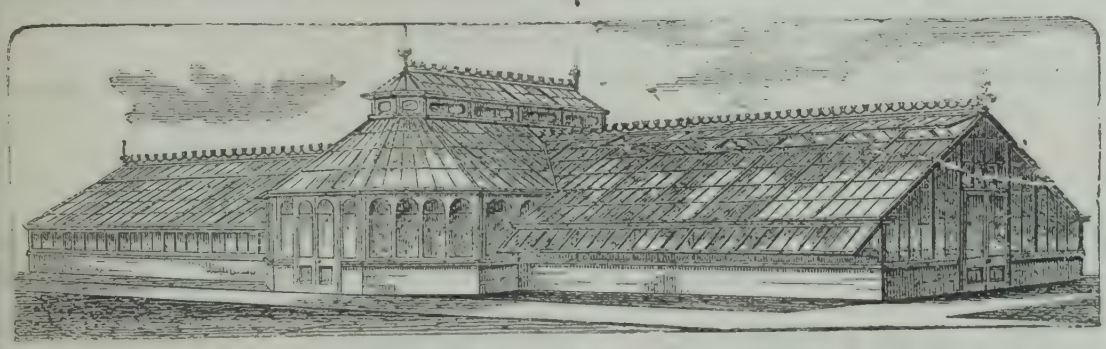
RICHARDS' NOTED PEAT.

(Trade supplied on best terms).

A large stock of the finest quality ORCHID PEAT. Also for Stove and Greenhouse Plants, Ferns, Rhododendrons, &c. By the sack, cubic yard, ton, or truck-load. Can be seen in bulk at London Wharf. Immediate despatch by any Rail or Steamer. Prompt and Special Quotations for delivery to any Station.

G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E.; Peat Grounds and Depôts, Ringwood and Wareham. Address all letters to London Wharf.



CYPRIPEDIUM INSIGNE SANDERÆ.

I have just acquired the whole of the available plants that remain unflowered of the importation of C. insigne from which SANDERÆ came. It is a noted and curious fact that NO OTHER TRUE SANDERÆ have flowered from later importations. I guarantee every plant to be from the original source, and grand things are sure to appear among them.

Good Plants with from two to five growths, 5s. each; 50s. per dozen.

P. WEATHERS, Silverhall Nursery, ISLEWORTH.

Williams'

STERLING NOVELTIES for 1895,

Our own introductions, now offered for first time.

PRIMULA SINENSIS FIMBRIATA

"SNOWBALL," New. The New Giant Strain.

Without exception, the finest White Primula in cultivation. It is more vigorous in growth than the old varieties, the foliage being remarkably strong. The flower stem is very sturdy, rises well above the foliage, and bears a profusion of massive flowers of a pure white colour of great substance. The individual blooms measure 2½ inches in diameter, and are exquisitely fringed. *Per Packet*, 5s.

TOMATO, WARDEN PARK FAVOURITE

(New), is a fine variety for winter work; grown in pots it will fruit when scarcely 6 inches high. Fruit of medium size, ribbed, and bright red colour. Very free setter, and a good bearer. *Per Packet*, 1s. 6d.

B. S. WILLIAMS & SON, Victoria and Paradise Nurseries,
UPPER HOLLOWAY, LONDON, N.

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 22, 1894.

MISLETOS.

MUCH has been written on the folk-lore of the common Misleto and the ceremonies and privileges attending its use at this season of the year; and almost everybody knows it growing, at least as it is to be had, or seen at the greengrocer's; yet, probably, few persons are aware of the wide geographical range it and its numerous congeners, often very different looking, have.

GEOGRAPHICAL RANGE.

It extends from Scandinavia to the Mediterranean, including North Africa, and from the extreme west of Europe to the extreme east of Asia, in China and Japan. It grows on a surprising variety of trees, including the Apple and the Scotch Fir, and most rarely on the Oak (see fig. 98, p. 759). Wide as its range is, however, it is by no means generally diffused and common over the whole area of its distribution, even where the conditions are apparently favourable to its existence. Thus in the eastern counties of England it is nowhere I believe, sufficiently abundant to be a pest; but, on the contrary, it is generally rare. In the north of England it is quite rare, and in Scotland and Ireland it only exists here and there, where it has been introduced; whereas in south-western England, especially in Herefordshire, and some of the neighbouring counties, it is excessively common, more particularly on Apple trees and Poplars.

This partial local profusion and partial local scarcity are exemplified also in its continental distribution; but it is a phenomenon not easily explained, because, as already mentioned, it flourishes on a great variety of trees, and it produces fruit freely season after season. Many other members of the same genus, or the same order, exhibit the same peculiarity. The common Misleto, Viscum album, presents little variety in habit and foliage, even in its most distant and diverse localities (see *Gardeners' Chronicle*, 1873, p. 1703, for figures of some varieties, repeated on p. 746). Size, due to degree of vigour, is the principal difference; and a person knowing it as it grows in England, would at once recognise it on seeing it in China or Japan, or the mountains of North India. It will be remembered that the common Misleto is furnished with ordinary green leaves, capable of assimilating crude food; but a large number of the species of Viscum are either leafless, or the leaves are reduced to small scale-like organs, and such species can consequently only use partly-organised food.

The genus is spread over the Old World; it is represented in all countries, including many

remote islands; yet it is absent from large trees of the same countries. For instance, it inhabits only the eastern side of Australia, while several species are found in New Zealand; and it extends eastward in the Pacific to the Hervey, Society, Marquesas, and Hawaiian Islands.

As now generally limited, the genus Viscum is not represented in America, where, however, other genera abound — genera not distinguishable except by a botanist; and some of the species have received the Old World's name of Misleto. Phoradendron flavescens, the Misleto of the Eastern States of North America, is very similar in foliage, habit, and colour to our own, and also has white berries. Apart from the two or three other European forms, regarded by some botanists as distinct species, by others as varieties of Viscum album, there are at least between thirty and forty species in various parts of the world.

Protective Arrangements.

The fact that the common Misleto flourishes on such a large variety of different trees, coupled with its wide range, and the fact that its seeds pass through the intestinal canal of birds without injury, indicates that it has no need of special protection to maintain its position in the struggle for existence. But it is evidently not so with all the species of the genus, whether leafy or leafless. Many of the leafy species, as in the allied genus Loranthus, have leaves so like the trees or shrubs on which they prey that they might easily be passed over unobserved. Of course, it is not so easy to find an explanation of the necessity for this protection, if protection it be, except perhaps in the fact that most of these species are comparatively local, and often restricted in their parasitism to one species or one genus of plants. It may, however, be no more than a physiological result of the association. It is less clear why certain leafless species live on spiny plants only, and are so situated with regard to the spines that they are strongly protected, whether they require protection or not. This is exemplified by a tiny South African species, Viscum minimum, which grows on some of the prickly, Cereus-like Euphorbias. As its name indicates, this species is perhaps the smallest species of the genus; an entire plant being often less than a quarter of an inch high, and bearing three minute flowers, one terminal and two lateral. These are succeeded by bright red berries, which, when ripe, are very much larger than the plant that bears them. Indeed, the axis of the plant is so small as to appear like a mere stalk to the berries; and any person might be excused for supposing it to be the fruit of the Euphorbia itself, in the absence of its own flowers or fruit. The South African Misletos number about a dozen species, half of which are leafy, and half leafless. Of the former, Viscum obscurum is one of the commonest, and it closely resembles the common European one; but it has yellowish-white berries. V. crassulæ is one of the rarer species, concerning which Professor Macowan, Government Botanist, Cape Colony, records, in a note in *Kew Herbarium*, that so far as his experience goes, it invariably grows on Portulacaria afra, an arborescent succulent, and bears a strong resemblance to it in foliage.

The Loranthus.

An even more striking instance of protection is afforded by the Chilian Loranthus aphyllus, a slender-tufted species 2 or 3 inches high, which preys invariably on Cereus Quisco, and is always found in the axils of the clusters of formidable spines, with which the Cereus is armed. Mr. J. W. Warburton, who lately sent specimens, to Kew, wrote that he had examined thousands of plants, and they were all in the same position. This species has large, showy red berries, and is well represented on its nurse-plant in the North Gallery at Kew.

In Australia the genus Viscum is largely replaced by the more showy species of Loranthus; but there are three species of the former on the eastern coast, two of which, V. orientale and V. articulatum, have a very wide distribution. The latter is a leafless species, with flat-

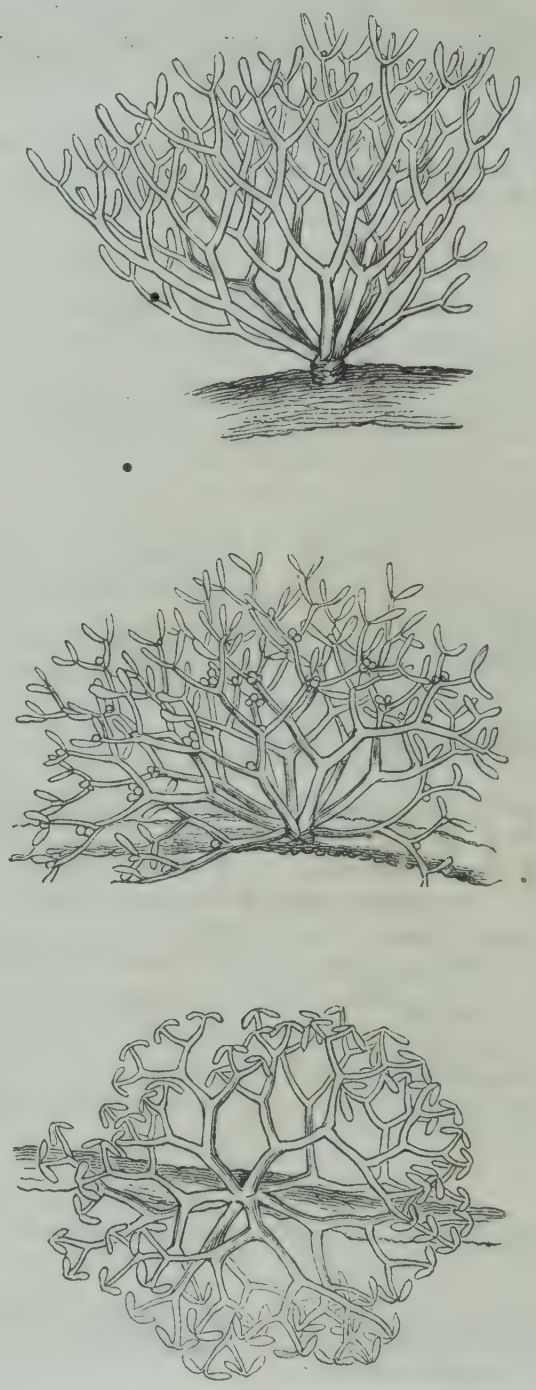

Fig. 93.—Varieties of Misleto. (see p. 745.)

tened, jointed branches, resembling an Opuntia in miniature, or even more closely the sea-weeds of the genus Halimeda. It is spread over Polynesia and tropical Asia.

The other members of the Loranthaceæ found in Europe are Loranthus europæus, a small-flowered species, not unlike the Misleto in foliage, and Arceuthobium Oxycedri, which is a slender leafless plant usually parasitical on some species of Juniper. The former occurs in central and southern, and the latter in south-eastern parts only. An Indian species of the latter genus, A. minutissimum, Sir Joseph Hooker describes as the smallest flowering plant he could call to mind. It grows on the branches of Pin excelsa, and the exceedingly small flowers a almost sunk in the bark.

I have already mentioned that the commo Misleto grows on a great variety of trees, ar in Bentham's *British Flora* it is stated that sometimes grows on the equally parasitic Lo anthus: a parasite on a parasite! I have n been able to verify this, but several other i stances are well known. Thus the New Zealan Tupeia antarctica, a plant of the same natur order, not unlike Misleto, has been found o Loranthus micranthus by several persons; an all the specimens of the four or five species o the Santalaceous genus Phacellaria in the Ke Herbarium are parasitic on various species o Loranthus.

I may mention, in conclusion, that the last named genus numbers at least 500 specie generally dispersed in tropical regions, an extending into some subtropical and temperat regions, and many have most brilliantly-coloure flowers, some of large size or in large cluster For example, L. macranthus, a native of th Andes of Quito, has flowers a foot long *W. Botting Hemsley.* [At the meeting of th Linnean Society on the 20th inst., Mr. Hemsle showed numerous most interesting specimens illustrating phenomena corresponding to thos mentioned in the above communication. Ed.]

ASPARAGUS SARMENTOSUS.

This is an elegant evergreen species of Asparagus from South Africa, which has been in cultivation on and off since Miller's time, but which does not appear to have received attention till recently. The spray here figured was shown from Kew at one of the summer meetings of the Royal Horticultural Society, when it attracted attention because of its gracefulness, the prettiness of its white starry flowers, and their powerful honey-like fragrance. The plant has been grown in a greenhouse since 1887, when it was brought from Grahamstown, where I found it on the side of a stream, its stems at that time being clothed with bright green leaves, and studded with bright red, pea-like berries, the outline of each stem suggesting a fine full fox-brush. Last summer the plant was a sheaf of stems 2 feet high, pretty enough before it bloomed, but when clothed with short crowded racemes of flowers, it was really a delightful picture. A specimen of it planted out in the Temperate-house has stems 4 feet high. The species varies somewhat in the form and size of its leaves, and in the arrangement of the flowers, the handsomest variety being that called densiflorus by Mr. Baker, and which is, I believe, identical with the plant here shown (fig. 94). It may be propagated by division, probably also from cuttings formed of the branchlets, but we have not tried the latter method. There are about a score of species of Asparagus cultivated at Kew, and this is one of the handsomest of them. *W. W., Kew.*

MARKET GARDENING: A PROFESSION FOR THE SONS OF GENTLEMEN.

Orchards.—Now that the time of year for planting is upon us, and the continued mildness favours this kind of work, although in general November is the best month, a few words on the subject for the benefit of intending fruit growers, may not be out of place. As in other matters so in this, the all-important question, "does it pay?" to plant orchards and grow Apples and Pears, is very naturally the first to arise. Treating of this subject some months ago at a meeting of gardeners, I was met, as I fully expected to be, with the objection that the orchards already planted, orchards laid out by our forefathers, did not pay, and there was no reason to suppose

Fig. 94.—Asparagus sarmentosus, Linn.: flowers white. (see p. 746)
From a Photograph taken at Kew.)

that newly-planted trees would prove a more remunerative investment? To this objection I urged that the old-established orchards failed in two important particulars: first, that they were old, and for the most part worn out; second, and most important, that the varieties of Apples grown were not marketable kinds; they were small and of poor quality, and, for the most part, useful only for their original purpose—cider making. And herein, to my mind, lies the whole secret of success. Certainly small inferior quality fruit does not and cannot pay to grow, but I contend that, given a suitable site, the best sorts of fruit and careful cultivation, Apples certainly, and in most districts Pears and Plums, will pay, and pay well, for the planting. As a proof that these statements are based upon something more substantial than mere hearsay, I may say that last year—a particularly fruitful one all the country over, and at a time when inferior fruit was practically unsaleable at even 1*s.* per bushel—I was able to get as much as 6*s.* for such Apples as Cox's Orange Pippin and Worcester Pearmain, and 4*s.* and 5*s.* for good cooking Apples. Fruit at these prices will certainly pay for growing, as all practical men will be ready to admit. Before touching upon the more technical part of the subject, I should like to meet one more objection that will probably be urged. Possibly some will say, "Why should we plant for future generations? We can never hope to get much result from trees of our own planting." There is an old saying, often quoted, "Plant Pears for your heirs;" and no doubt the same would be applied to Apple-growing too, if there happened to be a rhyme to suit it, but this, like many another specimen of ancient wisdom, has nowadays become a fallacy. The remedy against a long and tedious waiting before realising the fruits of your labours, lies in planting trees of the right form and habit of growth. Standards are becoming more and more discarded for trees of lower and more lateral growth, pyramids and bush trees taking their place. The reasons are obvious. Bush trees yield sooner, grow finer fruit, and mature it better, from being in closer proximity to the warmth of the earth; are less trouble to prune and pick from, and, in exposed places, are better able to withstand winds and weather. So that this objection has no real worth; plant pyramids or bush Apples and Pears, and in five years you will be picking valuable crops.

Situation.—Choose, if possible, a site for an orchard sheltered both north and east, but as this is not always possible, let it suffice to say that the spot should be as well protected naturally as can be found. Much can be done by the timely and judicious planting of screens around the orchards. Damsons form a good shelter, and are very inexpensive, and we have seen a good screen formed by a hedge of Poplars, planted close together, and topped to keep them bushy. As the orchard trees grow, however, they will protect each other more every year. It is generally considered that the side of a hill, a gentle slope southwards for preference, is the best site for an orchard, but I would even recommend planting on the hill-top, rather than in the valley. True, the soil may be richer, and the trees make more vigorous growth in the low-lying lands, but the great fear is that late frosts, such as we experienced this spring, will often ruin the crop at the blooming and setting time.

Soil.—Undoubtedly the best and most suitable soil for fruit trees of all sorts is a good sound loam, the deeper the better, and rather inclined to be heavy than too light. Such a soil is certainly the ideal, but the absence of it need not by any means preclude fruit-growing. Whilst we have before us the prolific orchards of Kent, where fruit is grown successfully in shallow chalky land, and weak sandy soils, and of Sussex, upon the clay, we need not despair of planting judiciously in almost any land of moderate depth. The great evil to be guarded against is wet, badly-drained land, where the water stagnates round the roots of the trees. This is the most fertile source of that dire enemy to Apple trees—canker. See, then, that your orchard site is well drained; that it has a natural drainage, if possible, but, at all events, is freed, as perfectly as can be managed, from stagnant water.

Cultivation and planting.—There has been a considerable difference of opinion amongst authorities as to the wisdom of trenching the land before planting an orchard, but, for my own part, I would advise the young fruit-grower to trench well and thoroughly at all costs. It seems to me—particularly on shallow soils—that the mere fact of having the best of the soil at the bottom must at least ensure the trees making a good start; must provide for the roots, eager to start into growth, just that essential they are seeking. Apart from this, trenching is, to some extent, an equivalent to draining.

My advice, then, would be, trench the land by all means if your pocket will allow of it, but failing this, have the field ploughed up as deeply as possible, and, if grass land, allow it a season to get into condition before planting. In planting, the distance from tree to tree and between the rows depends somewhat upon the nature or habit of the variety grown, whether widespreading or compact, and upon the form of tree chosen, standard or bush. For standards, Mr. Bunyard, of Maidstone, recommends a distance of 20 feet all ways; for bush and pyramids 15 feet, and even 12 feet for dwarf varieties. My own experience leads me to believe, that a uniform distance of 15 feet from tree to tree, is, for almost all purposes, the best. An acre of land will require 108 trees, 20 feet apart; 193 trees, 15 feet apart; and 302 trees, 12 feet apart.

A few words about the actual process of planting. Dismiss from your mind at once the erroneous idea that anyone can plant a tree; there is a proper method in planting as in all other operations—and the grower cannot be too careful for the future welfare of his orchards, that this first and most important work is done well. See first that the hole is large enough, that it is made to accommodate the roots, and not *vice versâ*, as is too often the case. Be careful, that in filling in, the tree is not planted too deeply, let the soil be made fine, so that the roots being spread out naturally, and not cramped, it may filter in amongst the fibres and induce them to make a start. The tree should be gently shaken up and down by the man holding it during the process of filling in, so as to settle the soil; and as far as possible, treading (a frequent source of injury to tender roots) should be avoided, and only a gentle pressure allowed just before banking up. When finished, the centre of the hole should be the highest, the soil sloping away on all sides from the tree. On very shallow soils, the planting should be as near the surface as possible, and the roots encouraged to keep near the top, by occasional mulchings of manure. I do not believe in heavy manuring at the time of planting, but think a good mulching round the trees the first year after planting far more efficacious. Have all the trees staked and firmly tied, day by day, as the planting proceeds, and never leave any unsecured at night, if it can be avoided. As we began by saying, November is the best month for planting, but it can be successfully effected up to January or even February, provided the weather remains open.

Trees.—As I have said before, I strongly recommend the orchard-planter, to choose trees in the form of pyramids or bushes, in preference to standards. Order the trees from some really reliable nurseryman, and see that they are well-rooted and free from any sign of disease, particularly canker, before planting them. We are rather of opinion that bushes grown in another county, or at all events in a soil differing in some ways from that of the new orchard, are to be preferred, inasmuch as the change usually promotes a free and more ready growth, so that the intending fruit-grower would do well to go further afield, than to the nearest nursery, merely because it is close to home.

Varieties.—This is the age of hungering after novelties, the horticulturist doing more to augment it than, perhaps, any other class. Without disparaging experiment and improvement, we heartily wish there were less of them, that the varieties of plants of all kinds were reduced by one-half, and that many of the high-sounding names of plants with their accompanying glowing qualities, were erased from the catalogues. It is misleading to the young mind, and vexatious to the more experienced, to read through the long list of modern tradesmen's catalogues, and to try to discriminate between good, bad, and indifferent, when all are so apparently excellent. What, and how to choose them, is the puzzle! Happily, there are certain sorts of Apples and Pears that have become known by their excellence as good marketable kinds, and that they are not more numerous is, to our mind, rather an advantage than otherwise. Without denying that there are many more varieties worthy of cultivation, we would submit that the following short lists of Apples and Pears will be found, in their way, complete, and, for market purposes, always saleable when well grown.

Apples.—Dessert: Mr. Gladstone, the best of the early Apples; Worcester Pearmain, to follow the first, a fine brilliant-coloured fruit, selling well straight off the trees; Cox's Orange Pippin, the most excellent of all English Apples for flavour, colour, and money-value; King of the Pippins is good in quality, and colours well, but it will not do on all soils, being inclined to canker. Blenheim Orange is too well known to need description, but it is rather a slow bearer; Lady Sudeley is considered the most showy dessert Apple yet introduced. Cooking:—Beauty of Kent, a great cropper, and of attractive appearance; Lane's Prince Albert, a gigantic Apple; Ecklinville Seedling, a flat, medium-sized fruit, of good quality; Wellington, valuable chiefly for its keeping properties.

Pears.—Dessert: Williams' Bon Chrétien, an old and early favourite; Clapp's Favourite, not sufficiently known or cultivated, being handsome in appearance, large, and of excellent flavour; Louise Bonne of Jersey, a great cropper; Doyenné du Comice, most delicious in flavour, the best in its season; Marie Louise, succeeds well in dry soils; Pitmaston Duchess, very large and popular; Beurré Clairgeau, a very free bearer, not first-rate quality, but a good market sort. Stewing: Catillac, a gigantic fruit, the best cooking Pear; Bellissime d'Hiver, heavy cropper and good keeper.

The varieties of both Apples and Pears that I have selected here are as nearly as possible those that usually succeed on most soils, and I have myself grown most of them with success upon somewhat shallow soil.

Cost.—Naturally this is an important consideration, and one that requires careful handling. What will it cost per acre to plant an orchard of Apples and Pears? Three-year-old trees should be obtainable by taking a quantity at from £5 to £7 per 100. Most nurserymen who quote trees at from 1*s.* 6*d.* to 2*s.* 6*d.* each are willing to average them at 1*s.* when several hundred are taken. The cost of the trees then, 15 feet apart, will average about £11; the labour of cultivating, planting, staking, mulching, &c., averages from £4 to £6 per acre, so that we may estimate that the cost per acre, inclusive of everything, will be about £16, more or less, according to the cultivation necessary.

Profit.—Bush and pyramid trees may be expected to yield a small crop three years after planting, and when about ten years old should be bearing heavily. Fabulous yields of 500 bushels per acre are on record, but it is not by these we must judge in order to obtain a fair idea of the probable profit. The average crop per acre from an orchard in full bearing may be stated at about 130 bushels, but taking a low figure, we may say 100 bushels, which, if good fruit, should sell readily at 4*s.* per bushel, leaving a profit, after deducting the expenses of picking, packing, &c., which would amount to from £3 to £4, of about £16 per acre. We leave it to our readers to decide whether the "game is worth the candle." *A Market Gardener.*

THE CALANTHES.

The garden varieties of Calanthe vestita are amongst the most useful of winter-flowering plants, and since numerous amateurs have occupied themselves in the raising of seedling Calanthes, crosses of various kinds have become very common. The beautiful pale and deep rose-coloured varieties have been produced by crossing the C. rosea (Limatodes rosea) with soft rose-coloured flower with C. vestita. Dominy effected this cross forty years ago, his seedlings, named C. Veitchii ×, flowering for the first time in Messrs. Veitch's nursery in 1859, and until Mr. Seden crossed C. Veitchii with C. vestita rubro-oculata twenty years later, nothing further was done in this direction. The produce of this cross was named C. Sedeni ×, and it is rather singular that the offspring of this cross should produce darker-coloured flowers than the seed-bearer C. Veitchii ×, while the pollen parent has pure white sepals and petals, with a reddish blotch in the centre. Mr. Cookson, Oakwood, Wylam-on-Tyne, and Sir Trevor Lawrence, Bart., have each been the means of introducing many seedling varieties; some of them producing spikes of great length, beset with beautiful pure white flowers, others with rosy-crimson flowers of large size, and others with different shades of pink. The cross-fertilisation and hybridising of Orchids is a slow process, but the time required in bringing to the flowering stage these Calanthes is shorter than that of any others which have been attempted. From the time of fecundation of the blossoms till plants appear above ground, a period of six months only intervenes, and these flower in three years. I have taken mental notes of the progress made in the flowers of these seedlings, and it does not appear that the more recent varieties show such well-marked progress as those flowered ten years or more ago. C. Bella, flowered in 1881, is a lovely variety with delicately tinted pale rose flowers; C. lentiginosa carminata in 1883, is a rich carmine; C. porphyrea, 1884, is of a lovely deep carmine colour; the white form of C. Veitchii was flowered more than ten years ago; Mr. N. Cookson raised a fine form and named it C. Cooksoni, and he has flowered some fine seedlings quite recently, and aided by his excellent gardener, Mr. W. Murray, he is likely to get new breaks from his more recent crosses. We make a very good show in Great Gearies with C. Veitchii × and the two forms of C. vestita with the red and yellow blotches on the lip; these can be purchased at a cheap rate. It is one of the most interesting, exciting occupations of the amateur or the gardener to raise crosses from flowers fertilised with a purpose, especially as the operation calls for but little labour, and the time of waiting for the ripening of the seed vessels and the appearance of the seedlings, and their flowering, are not very protracted.

The work of the hybridist in the production of distinct novelties of Calanthes was hampered owing to the lack of variety in the types; but now that so many distinct breaks have been made, this work is becoming much more interesting. The same process of progressive development must be applied to the Calanthes as to the Carnation, Pansy, Dahlia, &c. One generation of cultivators will hand the work down to another, with the result that a gradual improvement in the flower will go on. Improvement in the form of the flowers of Calanthes must be sought after as well as variety and distinctness of colour, just as we have for many years been looking for and also obtaining improved form in the flowers of our Gladiolus and Phloxes. How beautiful in form, as well as brilliant in colour, are the flowers of our Phloxes, compared with those of fifty years ago; and this desirable change has all been brought about by years of careful cross-fertilisation and good culture. The deciduous Calanthes seem to be quite as amenable to the same kind of manipulation. Changes occur in the seedlings which are not easily accounted for, and this is especially true of florists flowers, one lot being very great improvements on the parents, whilst others are equally disappointing. It is possible that the state of the weather at the time of fertilisation of the blooms may have some subtle kind of influence that is at present unknown to us. The year 1893 was the most favourable for seed-saving that has been known for many years, and I am looking forward to the flowering of the plants produced from the seed of that year with much interest.

As regards the culture of Calanthes, they may be separated from the general stock of Orchids and grown in any warm house. As to potting-soil, loam, sand, and decayed cow-manure in a dry state suit them best, with good drainage, and they should be rather under than over potted. They may be planted three good strong bulbs in a 5 or 6-inch flower-pot, with the base of the bulbs only in the soil. The new growths start from the bases of the bulbs, and with the growths the new roots are seen pushing freely amongst the new fresh loam. They require good treatment; for instance,

the bulbs are kept at rest until March in a warm house, say 50° to 55°, no water at all being afforded. I lay the pots on their sides under the stages till the time comes to repot them. Another important point is watering the plants. The pseudobulbs should be planted in a moderately-moist compost, and no water applied till it is seen that the roots are putting forth, when it should be afforded in moderation, till, as the season advances, the pots become filled with roots, when water may be applied almost every day, and when the new bulbs are forming, weak liquid manure-water may be applied, but all artificial manures should be avoided. The safest kind is cow-manure, even stable-manure being unsuited to their needs. The great thing is to keep them near the roof-glass in the warmest house when they are making their growth, shading from bright sunshine, but not overdoing the shading. The leaves will begin to decay when the flower-spikes appear in the autumn. *J. Douglas.*

(From Foster-Melliar's *Book of the Rose.*)

BOOK NOTICE.

THE BOOK OF THE ROSE. By the Rev. A. Foster-Melliar, M.A., Rector of Sproughton, Suffolk. (Macmillan & Co., pp. 336, 29 illustrations.)

When a writer undertakes to add another book on any subject on which many have been written, there are two questions which inevitably occur to one's mind—first, whether there is room for such an addition; and second, whether the writer is qualified for his task. With regard to the book now before us, we think the answer to both these questions must be in the affirmative; we have had, it is true, books of various kinds, but not one of them quite answers the expectations of the Rose grower, or meets his many requirements; of course the most popular book is Dean Hole's, and neither Mr. Foster-Melliar's or any other book, is likely to dethrone it from that position: but we believe the Dean himself will be the first to admit that there is room for another more thorough and more practical work. With regard to the second point, there can be little doubt as to Mr. Foster-Melliar's qualifications for the task; he has been a successful grower and exhibitor of the Rose, especially of the Tea Rose, for many years; he has been a careful and accurate observer, and a constant contributor to gardening periodicals on his favourite flower. His style is bright, and the book before us is one which is easy and pleasant to read.

The *Book of the Rose* consists of fourteen chapters, in which the following subjects are treated: the history and classification; situation and soil; planting; manures; pruning; stocks; propagation; pests; Roses under glass; exhibiting; manners and customs; selections and calendar of operations;—of these, the longest and one which sets forth more especially the writer's qualifications, is that on "Manners and Customs," which is, in truth, a graphic description of all the best known and most valuable Roses. We have no wish that this notice should be of so comprehensive a character as to be in any way a substitute for the book itself, and we shall, therefore, note what we consider its chief characteristics and excellencies.

In the first place, it is a book for exhibitors; Mr. Foster-Melliar does not himself say so, but he writes for enthusiasts. Now, we never yet knew a Rose enthusiast who either was not, or did not aspire to be, an exhibitor. We know there are some purists who look upon this statement as a very shocking one, but it is none the less true; and, what is more, we have known many an amateur who has been an exhibitor, but who, for one reason or another, has retired from the contest, and with this result, that the enthusiasm has gone. They even cease to attend Rose shows; and although they will tell you that they still love their Rose garden, you can see that the means and labour that used to be bestowed upon it no longer find a place. The exhibitor, then, or the would-be exhibitor, will find in this book everything that he needs, not only in the actual way of setting up his Roses, but also the method of culture which will bring them up to the point of perfection he requires.

The second point of excellence in the book is its thoroughness; nothing is left to mere conjecture or loose interpretations; you are told exactly what to do; and you must be exacting indeed if you find any point on which you desire information that is not included in these fourteen chapters. Again, and in close connection with this, we would notice its thoroughly practical character: take, for example, what the author says on the subject of planting—we refer merely to one portion of the subject—that of filling up vacancies in beds; he says: "If a separate hole be made for each plant, let it be wide enough; do not curve the roots, or let them cross each other. If they naturally want to cross, or there be two or more going in the same direction, put some fairly light soil between them that they may lie in layers, but always horizontally. See that the soil which is put against the roots themselves, or to cover each layer of roots, is at all events fairly fine and crumbly, if not actually dry and powdery; lift the plant by the top up and down a little with a shaking movement to settle the soil more thoroughly amongst the fibres, and remember that the whole operation of planting is done much more thoroughly and expeditiously by two men than by one. If single-handed, a short pointed stick for scratching fine soil between the fibres will often be found more handy than trowel or spade. Just fairly cover all the roots with a couple of inches of soil, tread it very lightly and carefully, and pass on to the next plant, for the rest of the soil can be added at the conclusion of the day's work." Surely no one, after reading this, can say he does not know how to plant a Rose. But, undoubtedly, the most important portion of the book, as we have already said, is that in which, under the quaint title of "Manners and Customs," he describes all the best Roses; this chapter occupies nearly one-third of the volume. We venture to say that there are few persons, if any, who could take up this ground as he has done; he says, "On looking over a good collection of Roses, a keen observer, even if he be unlearned in their culture, cannot fail to be struck with the difference observable in what is called the habit of each sort, for there is almost endless variety in wood, leaves, thorns, strength and manner of growth, apart from the blooms themselves. He would also probably notice a good many of what he would call red Roses, very much alike to his untrained eyes in general appearance, and he might wonder how they could all be distinguished apart." To show how he carries his views out, take his description of "General Jacqueminot" (Rousselet, 1853): good, but rather slender growth, and fine but thin foliage; liable to mildew, but not much injured by rain; very free-flowering, fragrant, and a good autumnal, but decidedly thin. It must be grown very strong, and cut young to be fit for exhibition; but it is often well shown, principally by nursery-

*

men and large amateurs, and is best as a standard maiden. As bright as Duke of Edinburgh when grown to perfection, but not lasting, or of the largest size; still, "Le Brav Général" knows its weakness, "pulls itself together" in hot weather, and tightens its point as hard as it can. Few Roses have had such a lasting reputation; for this grand old veteran is the great-grandfather of almost all our red H. P.'s, and is still grown very largely on all stocks for market and florists' purposes, "Générals" being almost as well and affectionately known in the trade as "Niels." Of course, there will be differences of opinion on some of the points on which the author insists; on two subjects which have been frequently written on in the pages of the *Gardeners' Chronicle*, we are glad to find that Mr. Foster-Melliar is in accord with those writers. He dislikes the idea of making a separate class of hybrid Teas, so called, and also objects to the multiplication of sections, and would include under the term hybrid Perpetuals, the so-called hybrid Teas and perpetual Bourbons, such as Mrs. Paul. If this were done, it would simplify matters very much.

The book is well got up; paper, type, and binding are alike good; it is illustrated with twenty-nine process-blocks, for the use of two of which we are indebted to the publishers. Among them are some celebrated Rose gardens, Rose bouquets, and portraits of individual flowers. It comes out at an opportune time; no more acceptable Christmas gift could be offered to a Rose enthusiast than this charming and instructive volume, which, as a practical guide, we venture to think justifies its title, ambitious though it be, of *The Book of the Rose*.

RED POISON FRUITS.

Some singular circumstances have just been brought to our notice by the Government Botanist for Queensland, in Australia, which may be of interest to our readers, although we are as yet unable fully to penetrate the mystery. The story commences with a paragraph in a local newspaper to the effect that on September 11, 1894, "A lad named Herbert Ellis, who was admitted to the hospital last week, suffering from blindness, supposed to be caused through eating red berries, has died from general paralysis." The comment made by the botanist in question on this text is, that the berries were the fruits of Rhodomyrtus macrocarpa, which "have for some years past been accused of causing blindness in persons who have eaten largely of them in the raw state, while others have eaten of it freely without feeling any ill effects." Having received from the scene of the above accident a large supply of the fruit and foliage, and as many particulars as could be learnt; these were sent over to London for examination and report. From the account of the disaster, it transpires that the young man was over twenty years of age, and it seems that a boy had told him that the fruit caused blindness, so that its pernicious effects must have been largely known.

The Government botanist states that he had previously been appealed to for an explanation of this phenomenon with which the fruit was credited, and relying upon its affinities, he had always stated that it could not cause blindness, as the fruit was not unwholesome, but one of the native species which might doubtless be improved, and become worth growing for its fruit, after careful selection and cultivation. This was the position when the report of the disaster, and the delinquent fruits, were communicated to our correspondent. The fruits were sent over in two conditions, in one case immersed in preservative fluid, and in the other dried and packed in charcoal. The moist fruits were about the size and appearance of Olives, and when they arrived were of the same colour, as all the redness had disappeared. The element of doubt still surrounds the determination of the name, since fruits and leaves sent to Kew are stated to be quite different from the fruit and leaves of the Rhodomyrtus macrocarpa of Bentham, and also those of Baron Mueller, but what the true designation of the species was could not be determined by a superficial search.

The next step was to ascertain the cause of its toxological properties. The doctor at the hospital to which the young man was sent, expressed the opinion that some microbe or bacterium must have been present in the fruit. Hence, it has been inferred that such persons as have eaten of the fruit and found it harmless, may have eaten it when free from any parasite; and, in other cases, where bad effects have followed, the fruits, although apparently sound, were infested by some parasite which caused the mischief. With these details before us, we examined the fruits and the leaves, in which we were also kindly assisted by Mr. G. Massee, of Kew. Superficially, it was not difficult to recognise beneath the cuticle of the fruits, and closely collected together in large blotches, small globose, yellowish granules, not half a millimètre in diameter, but without any definite perithecium. These granules contain rather large sporules, having the character of those prevalent in the genus Glæosporium, and for that reason we have given the parasite the name of Glæosporium periculosum.* The sporules are colourless, and elliptic-oblong, with rounded ends, standing upon short peduncles. It is presumed that, when fully mature, these sporules are discharged in tendrils through the broken cuticle; but this could not be determined from the fruits immersed in fluid. Throughout the entire fleshy mass of the fruit, stout branched threads of mycelium permeated in all directions. On the leaves and twigs there were no indications of the presence of the same parasite; therefore it appears to be confined to the fruits. On the subject of the presence of microbes, we are not in a position to affirm anything, except that we did not recognise them.

Whether the parasite imparts toxological properties to the fruit we are not prepared to affirm or deny, but the most singular property is that of causing blindness. Later information respecting the youth who succumbed, is to the effect that he died in great agony. "The paralysis worked upwards from his feet, and before he died he was paralysed right up, yet his heart and lungs worked, and he was conscious up to within a short time of his death. He declared that the fruits in question were the only ones of which he had eaten." As a supplement, the doctors report that the symptoms were like those of Hemlock poisoning (perhaps, rather of Belladonna).

Certainly, it is possible that a minute parasitic fungus may so change the character of an otherwise wholesome fruit as to render it deleterious or poisonous; but we are not aware of any facts in support of the conclusion that it could specially affect the eyes, or cause blindness. If such a change was wrought in the present instance it was a most remarkable change. It seems to require stronger confirmation whether the fruit is really harmless at any time, because it is just as probable that it is normally poisonous, as that the minute fungus is the cause of the mischief. Under any circumstances, we have not sufficient evidence to convict the fungus, nor can we cite a single case in evidence to support the theory.

There are numerous species of Glæosporium which attack fruits of different kinds—Grapes, Pears, Apricots, Melons, &c.; and we know that the presence of a small mould, or of a fungus similar to the above, will impart a distinct and unpleasant flavour to very pleasant fruits, so that we cannot deny the possibility of the cause alleged being a sufficient cause. We have alluded already to the doubts expressed as to the accurate determination of the host plant; but this is a point which will not be so difficult to settle as that of the origin of the poison. As the case stands, it is one of sufficient interest to warrant this notice, and we hope that it may result in a speedy solution of all doubts. *M. C. Cooke.*

* *Glæosporium periculosum*, Cooke & Massee.—Pustules occupying the whole or part of the surface of ripe fruit, forming pale yellowish minute nodules beneath the cuticle, about ½ mm. Sporules elliptic-oblong, straight or curved, continuous, obtuse at the ends, hyaline 14—15 × 4 μ. on cylindrical sporophores, 6—8 × 2 μ. Entire fruit permeated with dense branched hyphæ, 6—8 μ diam. On ripe fruits of Rhodomyrtus macrocarpa (?). Queensland.

SICILIAN ESSENCE INDUSTRY AND THE EARTHQUAKE.

The following interesting note, bearing on the recent earthquake in Italy, is from our contemporary, the *Chemist and Druggist*, who says—Our Sicilian correspondent, writing on November 23, informs us that, since his telegram of last week, no further serious earthquake shock has taken place, though the panic still continues, people being afraid to return to their houses, and keeping to tents and wooden shelters.

Reports come from Calabria that in the plain of Radicena the gangs of men who go out to make essence of Sweet Orange refuse to continue work, owing to the damage done to their houses, some of which continue to fall every day. The centre of this earthquake is in the district where the whole of the Calabrian Sweet Orange essence is made, and where the principal article of production is Olive-oil. This Olive-oil is stored in huge cement cisterns dug in the ground, and it is quite possible that some of these have been cracked, but a leak would not be evident for some time.

With few exceptions, the chemists shops have been closed, but they are now commencing to re-open for a few hours daily. In Messina the chemists shops, which are on the ground floor, and mostly have vaulted ceilings, appear to have escaped without serious damage beyond the cracking of some walls. As the town has been built specially to resist earthquakes, these walls in many cases are 4 feet thick. It is estimated that several millions of liras of damage has been done in Messina, and several of the essence merchants' houses have suffered severely. Everybody, except the working population, has escaped to the country, with the result that business is at a complete standstill. The first shipments of essence of lemon, which are usually made about the beginning of November, will not probably be made till the beginning of next month (December).

The effect of the earthquake on prices is, of course, a chief topic of conversation, and opinions are divided. It is most probable, however, that as regards essence, the tendency will be to harden prices, at least for a time. The citric acid factory, which was re-opened at Syracuse some months since, has now been definitely closed, but it is not improbable that the output from Sicily will be considerably increased in the course of this year.

SCOTLAND.

GARDENING NOTES FROM PAISLEY.

In the west of Scotland, the town and district of Paisley have maintained a name for high-class horticulture for a long time, the numerous suburban gardens of the environs of the town so full of factories and wealth-producing industries, being centres of good gardening. It is remarkable, as being the residence of some of the wealthiest manufacturers of the north, and liberal and philanthropic employers of labour, proofs of which are everywhere apparent. A recent visit to Kilnside, the seat of Stewart Clark, Esq.—where the cultivation of plants under glass is pursued with zeal and success by the gardener, Mr. McLauchlan—revealed spacious and well-kept lawns diversified with large plantations of shrubs, the Rhododendrons especially looking green and healthy, as if they were not immediately surrounded by large factories, pouring forth volumes of smoke. Mr. McLauchlan conducted his visitors through the glass-houses, in which were long lines of Chrysanthemum plants; about 700 are grown, some with four stems, every plant being in luxuriant health, and giving promise of fine blooms. Some of the most admired were Purity, Yellow Comet, Yellow Marguerite, and Feu d'Or; and the choicest varieties are grown in great numbers for home decoration and exhibition.

A Camellia-house, which was afterwards visited, showed plants growing in a bed of soil mostly the double-flowered white, that gave promise of a capital

show of flowers about the end of the year, a season when they are most admired. When inspecting the Tomato-house we were informed by the gardener that Austin's Eclipse and Conference are the varieties most favoured, but one or the other may be discarded, the fruits being so much alike. Sutton's Magnum Bonum, and Perfection from the same firm, are good-bearing Tomatos. The Azalea-house, is a valuable structure for furnishing cut flowers and plants in the winter and spring. Specimen Azalea-growing has some amount of attention, but varieties for early forcing and plants for furnishing cut flowers are in the greater numbers. Azalea amœna is much valued for early work, its nice colour and the simplicity of its culture recommending it. Passing large clumps of Rhododendrons, the ornate conservatory which is fittingly decorated with foliage plants, pillars draped with Ivies, &c., has a pleasing effect. It is elaborately decorated with mirrors on the walls. This structure when seen through a small greenery has a very fine effect. A cool Orchid-house contained more than 500 Odontoglossums of the more useful species and varieties, and here recently about 250 spikes of bloom could be observed at one time. Some good specimens of Cattleyas and Cœlogynes were remarked in other houses; and the Chatsworth variety of the latter is the one most in favour; it is cultivated in large wooden tubs. In a plant stove were fine-foliaged plants, some capital plants of Dendrobiums nobile and Wardianum; Crotons, Dracænas, Anthuriums, and Pandanus were associated with these, very luxuriant of growth, and of exquisite colours. Cymbidium Lowianum giganteum was also in fine form in this house. In the fernery a beautiful selection of species is cultivated, Davallias being numerous, these affording excellent material for cutting. Large numbers of Dendrobium nobile were doing well in this structure amongst the Ferns. A Pelargonium-house for the culture of the zonal varieties, both double and single-flowered, was visited, the plants therein being profusely flowered. We left this well-managed place gratified with that we had seen.

At Woodside, the residence of A. Coates, Esq., the garden is well managed by Mr. Hogg, who is widely known for his knowledge of plants, and like other gardeners about the town, he cultivates an immense number of them. Bulbs, flowering shrubs, and other plants, are grown by the thousand for supplying cut flowers. Woodside is a more smoke-laden part of Paisley than Kilnside, and indoors culture is chiefly pursued. The Odontoglossum-house contains many fine plants, all of which are in robust health in spite of inimical surroundings. The Azalea-house disclosed plants especially prepared for early flowering, the buds having been set early in the summer, and the plants duly rested, thus rendering the forcing of them into bloom an easy matter. Heaths are not grown nearly so plentifully as they once were at Woodside, and they have, as elsewhere, had to make way for others—a regretable circumstance, these being among the most beautiful of cultivated plants. Erica Marnockiana, E. jasminiflora alba, and E. j. ventricosa, are in fine form, and we hope further reductions in the number of Ericas will not take place. Another house is set apart chiefly for cultivating the Dendrobium, of which a very choice selection was noted. Cattleyas were noted in good condition along one side of this house, including a quantity of C. labiata, which were doing well. Cymbidiums are well represented, and in fine health. Passing on through some stoves, Crotons, especially fine in colour and in health, Cypripediums and Vandas also in good form; and Cypripedium grande of extra merit was observed. In the next house entered were Lælias, Cœlogynes, Cypripediums, and Miltonia vexillaria in excellent form; fine Dendrobium chrysanthum, and Cattleya gigas were likewise noted. After passing through the Melon-house, where Tuberoses and Roses were growing, a filmy fernery, cool and moist, was entered. Here no special attention was given to shading the Ferns. Here are raised numerous Ferns grown from spores to meet the requirements of the place. In the Tomato-house Austin's Eclipse and Comet are the favourite varieties. Czar and Kirke's Plums in pots were remarked as giving excellent returns in the form of good crops. A pitful of Nerines made an attractive display with their crimson flowers. One thing we noted which baffles Mr. Hogg's skill and resources in the smoky locality—and that is, Rose cultivation in the open ground—the plants making a stunted and poor growth. The Camellia-house was filled with plants, having bright green foliage, and every shoot well furnished with flower-buds. A house nearly full of Asparagus plumosus, and Palms, show what has to be put under contribution for cutting for decorative purposes; and Gleichenias, Eucharis, and many other popular species are each to be seen in quantities.

We passed on to the ornamental conservatory, with woodwork of Teak and floor of mosaic. To this handsome structure there is egress from the house. Plant-furnishing is done lightly, grace being preferred to crowding flowers and foliage in masses; and such should be the case in every show-house.

From the conservatory is entered the rockery under glass, where a cool moist atmosphere is exchanged for that of the conservatory. The steps, rocky facings, and water surrounded by rocks, are most natural in design. From the rocks hang fine-foliaged Begonias, Selaginellas, Filmy Ferns, Tradescantias—indeed, any plants which can exist in health have a position in this interesting place. Renovations and alterations prevented us from seeing this unique place at its best.

The wild garden was next visited, where plants in great variety are grown amongst rocks, on mounds, and by the side of pools of water. Nymphæas are effective, also alpine plants, Daphnes, Foxgloves, and a variety of herbaceous plants. Ericas, Ferns, Spiræas, Veronicas, Cupressus, and many other species are suitably planted, the whole forming a delightful contrast to the formal glass-houses.

We left these gardens with one regret only, and that was the short time we could spend in such a place, teeming with horticultural interest. We had so much to thank Mr. Hogg for. *M. T.*

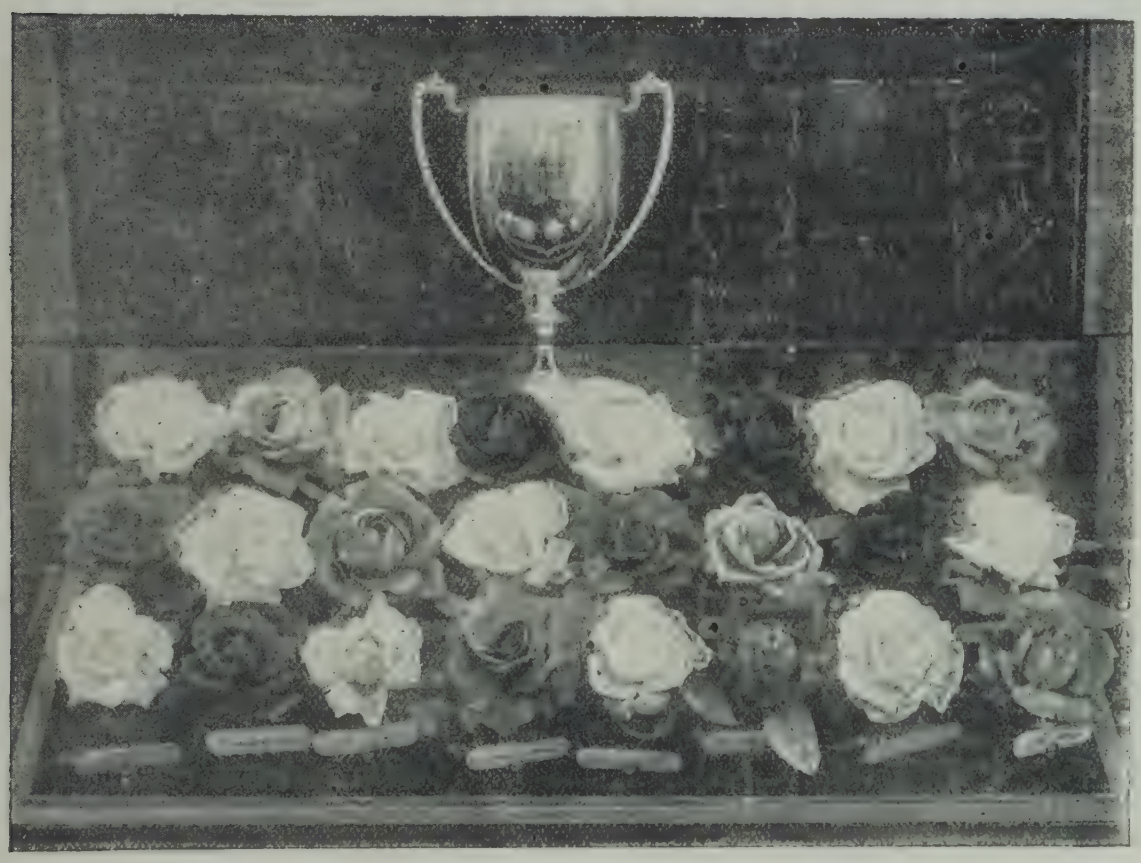

Fig. 96.—"A GOOD TWENTY-FOUR": EXHIBITED BY MESSRS. D. PRIOR AND SON, AT WOODBRIDGE, 1894. (SEE P. 749.)

(From Foster-Melliar's *Book of the Rose.*)

THE BOX AVENUE AT BECKFORD HALL GARDENS.

The Gloucestershire residence of Capt. Williams at Beckford is situated in the northern part of the county, about four miles from Tewkesbury, and the same distance from Teddington Cross. At this latter place there is an ancient direction-post, chiefly of stone, but with seven wooden arms, pointing to seven towns or villages. On one side is the following inscription:—

> Edmund Attwood of the Vine Tree
> At the first erected me.
> And freely he did this bestow,
> Strange travellers the way to show,
> Eight generations past and gone,
> Repaired by Edmund Attwood of Teddington.

In most gardens, especially those of ancient date, there is some special feature for which the place is celebrated. We had heard of the famous Box avenue at Beckford, and as we were in the vicinity of the gardens a few days ago, we availed ourselves of the privilege that lay within our reach. The Box avenue, or rather walk as it is called, is upwards of 300 feet long and 20 feet high, and is said to have been planted 800 years. It has certainly a most venerable appearance, and takes us back in imagination to the time when the monks walked beneath its shade, and visited the holy well in the centre of the garden, and which forms another important feature of the place. On the south side of the avenue each Box tree is cut into the form of a large barrel for about 6 feet high, afterwards they are allowed to assume their natural shape. Part of the kitchen garden was skirted with Box hedges about 2 feet high, which were cut perfectly square, and where the ground rose and steps had to be employed, the Box hedges running parallel with the steps, also rise in the form of steps, and presented a most singular appearance.

A new walled-in wing was being added to the kitchen garden, that was to be devoted chiefly to the cultivation of hardy fruits. A large part of the new wall with a south aspect was being planted with the best sorts of diagonal cordon Pears. Glancing at the labels we noticed such sorts as Durondeau, Marie Guise, Marie Louise d'Uccle, Nouvelle Fulvie, Bergamotte d'Esperen, Beurré Rance, Beurré d'Amanlis, Williams' Bon Chrétien, Louise Bonne of Jersey,

Beurré Clairgeau, Doyenné du Comice, Pitmaston Duchess, &c. The north wall was devoted to Morello Cherries, and other spaces to dessert Cherries and Plums. In the old kitchen-garden we noticed excellent crops of winter vegetables, and specially fine rows of Celery.

In one of the houses there was an extra fine batch of well-grown Chrysanthemums, including about 120 of the best sorts in commerce. Mr. Farmer evidently understands the cultivation of this favourite autumnal flower, and what we saw were brought to a state of high perfection. It is not necessary to give the sorts; suffice it to say, that the best new and old varieties formed the collection. The pleasure-grounds are extensive, and contained some glorious specimens of Coniferæ, while from various standpoints charming views of the surrounding hills could be obtained. In suitable positions Yew trees were cut into hedges and archways, which form a distinct feature on the ornamental grounds. All the flower-beds were furnished with spring-blooming plants, which will make a grand display during their season of bloom. Mr. Farmer had the work well in hand; every department bore evidence of skilful management, and our hasty call at the gardens at Beckford will long remain fresh on our memory. *Quintin Read.*

Colonial Notes.

WEST INDIES.

Grenada.—Mr. W. E. Broadway, lately Assistant-Superintendent of the Royal Botanical Gardens, Trinidad, has been appointed Superintendent of the Botanic Garden.

In the *Bulletin of the Botanic Garden* high praise is awarded to Mr. G. Whitfield Smith, the late Curator of the garden for the beauty, neatness, and compactness of the garden lately under his charge. It gives some idea of the difficulties colonial gardeners have to encounter to read of the pink and blue crabs which have to be contended with, to say nothing of white ants. The importance of local herbaria properly named is insisted on.

Trinidad.

We are glad to see that awards at the Chicago exhibition were made to the Trinidad Botanical Department for excellence in the manufacture of essential oil of Tangierine and Seville Oranges, of Nutmeg, Mace, Bay (Pimento acris), Lemon-grass, Cloves, and Lemon; also for the fine quality of the Sanseviera Hemp.

Sugar-cane Disease.

In some of the West India islands great destruction is caused by a fungus called Trichosphæria. Another disease called root-disease is due to a fungus called Colletotrichum. It is pointed out, however, by the Kew authorities, that it is probable the two fungi are really phases of one and the same. Mr. Dyer recommends the cutting out and burning of every diseased cane. Of course, no part of a diseased plant should be used for purposes of propagation.

Jamaica Botanical "Bulletin."

The *Bulletin* of the Botanical Department, Jamaica, for July, 1894, contains the following papers:—"Report on Cockpit Country;" "Notes on Rubber Plants, Sugar-cane Disease, Preserving Mangoes, The Cultivation of Vegetables, Utilisation of Bananas for Meal, Science and Agriculture," &c. The article on rubber plants contains a condensed account of the several trees yielding caoutchouc for commercial purposes, such as Hevea brasiliensis, Para rubber; Ficus elastica, Assam rubber; Forstonia floribunda, Jamaica rubber, not yet in commerce; and Colombia scrap rubber, the plant producing which is not specified.

Queensland.

The *Bulletin* of the Department of Agriculture for September, 1894, contains a descriptive list of new plants discovered in the colony, prepared by Mr. F. M. Bailey.

"Botany Abridged."

Under this title Mr. F. M. Bailey, the colonial botanist of Queensland, has published a little treatise, with the object of assisting school teachers to recognise and distinguish the more common or important plants of the colony.

The Week's Work.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

HINTS ON SEASONABLE OPERATIONS.—The time is at hand when most gardeners have large demands made upon them for all kinds of flowering and foliage plants for use in the dwelling. These plants get placed therein under conditions that are not conducive to their well-being; something, however, can be done to counteract these conditions by a timely preparation of the plants. The plants having been selected according to the various purposes for which they will be employed, those which are growing in warm houses should be removed to one slightly cooler for a few days, and then to one that is still cooler, syringing being meanwhile withheld. Foliage plants should be carefully sponged over with skimmed milk, so as to give the leaves a glossy appearance, and cause them to show up well under artificial light, washing it off when the plants return to the garden. In placing plants in recesses and corners, a careful choice should be made, and in draughty positions plants of small value should be used. A useful and hardy plant for such places, or where sunlight is limited in amount, is Aspidistra lurida and its variety, A. l. variegata. In point of immunity from injury under bad conditions, I would place Palms next in order, and of these the Kentias, viz., K. Belmoreana and K. Fosteriana, both of a graceful habit, and very little inferior in that respect to Cocos Weddeliana. Cyperus longus and C. alternifolius are plants that may be used without fear of loss in halls, &c. Grevillea robusta is a plant that makes a handsome table-plant, or a "dot" plant in a group of others. Araucaria excelsa is a useful subject at this season. Flowering plants in most gardens are represented by Cyclamens, Primula sinensis, Cinerarias, Richardias, Carnations, Begonias of the winter-flowering section, Azaleas, Lily of the Valley, Hyacinths, and Lilium longiflorum Harrisii; this last a very useful addition to plants that force easily into flower at this season. Before any plants are taken into the dwelling, the pots ought to be washed quite clean, the necessary tying and sticking attended to, and some fresh green moss neatly placed on the soil.

TUBEROUS-ROOTED BEGONIAS.—A pinch of seed may now be sown in shallow seed-pans, half-filled with crocks, over which some half-dried moss or some soil siftings may be placed, filling the pans with loam, leaf-soil, and peat, in equal parts, and adding a fair amount of sharp silver-sand. This compost, after a thorough mixing, must be passed through a sieve with a quarter-inch mesh, and on the top of the pan a thin layer of the soil which has been sifted in a still finer sieve should be placed. At this early date the seed should be sprinkled over with fine silver-sand, and the soil used being in a fairly moist state, no water needs to be afforded at the start. Stand in a propagating-case, and place on each pan a neat, closely-fitting piece of glass.

MIGNONETTE.—Those plants which will flower at the end of the month of March should be at the present date from 2 to 3 inches high. They may need shifting into 48's, and support afforded them by means of pieces of birch cut from worn-out brooms. Top-dress those in flower, using good loam and rotted stable-dung, and a handful of Thomson's Vine-manure for the purpose and admit abundance of air in mild weather.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

FIGS.—These can only be successfully fruited outdoors by protecting the embryo fruit upon which alone there is any hope of crop that will ripen in an ordinary season being obtained. This protection should not be afforded the trees too early in late autumn, for should mild weather like the present set in, the buds and embryo fruits will be induced to move with the probability of their being destroyed by hard frosts at a later period. All protecting materials should however be in readiness to put over the trees directly sharp frosts threaten. With the difference that the Fig requires protection in the winter, the methods adopted with Peaches on open walls are also very suitable for it; and where wide boards are placed under the coping for the protection of the bloom of wall trees in the spring, these should be put in place forthwith over the Fig trees; for the present it will suffice to place boughs of the Spruce Fir or other Conifer of similar flat growth over the Fig, sticking them behind the larger branches, or nailing the butt-ends to the wall. These boughs will last till the early spring in good condition, and may be supplemented then with fish-nets suspended from the boards and pegged down to the border. This method of protecting the embryo fruit of Figs is in every way preferable to the practice of bundling up the branches and wrapping them round with hay or straw bands.

THE BUDS OF PLUMS AND DAMSONS AND THE BULLFINCHES.—In gardens where bullfinches give trouble, means ought to be taken forthwith to make the buds of the above-named fruits secure from attack. Plum trees which are pruned, and the Damson trees of middle size, should be syringed with whitewash made of freshly-slaked lime, with some soot added to make it the more distasteful; red Currant and Gooseberry bushes being also dressed with the same. If the trees are too large to be readily syringed, the bullfinches must be trapped or shot. In this locality, large numbers are caught by having a good "call" bird in a cage as a decoy. The cage is placed near to a low bush, the branches of which are smeared with bird-lime, this being found a more expeditious way of catching them than waiting for them to go into a cage-trap. Planting Plums or Damsons close by a wood or belt of trees should, if possible, be avoided, the buds being taken wholesale in such places by the bullfinches and other birds.

TOP-DRESSING FRUIT-TREE BORDERS.—As fast as the work of pruning, nailing, and dressing of wall-fruit trees is finished, the dressing of the borders should be commenced, provided the weather is not unfavourable. When the border is about 6 feet wide, and it is reserved for the roots of the trees, a compost consisting of turfy loam, charred garden-refuse, and old mortar should be employed, the roots being kept thereby in the upper layer of soil. In this position they are acted upon by the sun and air to a greater degree than is possible when they lay deep in the soil moreover, manures reach them with greater certainty. This applies more particularly to Pears on the quince-stock, and to Plums and other trees, which can thus be induced to make their roots near the surface of the land. Wider borders which are cropped with vegetables, &c., should not be dressed with these substances in the same manner, but the dressing should be placed where the roots are, that is, at some distance from the surface. The uncropped part, say, 4 feet wide, after being hoed and raked, should be pricked over with a fork, and receive a coating of charred garden-refuse and old mortar. The fruit borders around the vegetable quarters should be carefully dug so as not to destroy any of the roots of the trees. In stiff land the roots may be encouraged to come to the surface by turning the soil up deeply, and leaving it in the rough state as dug, and by affording a good dressing of charred refuse, leaving all to become amalgamated and pulverised by the winter's frost and wind. If the land be light and sandy, then a top-dressing of stiff loam or soil of a clayey nature will benefit the trees.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

PEAS.—Where Peas were sown out-of-doors in late autumn, the plants will now be sufficiently advanced to allow of a little soil being drawn up on each side of the rows, further protection being afforded by sticking short stiff twigs of Yew or of Spruce Fir into the ground firmly, so that they are not blown about to the injury of the plants. A watch should be kept on the plants that they are not reduced in numbers or in stature by mice and slugs. The former must be trapped, and the latter kept at a distance by an occasional sprinkling of fresh-slaked lime down each side of the rows; and

should the slugs be very troublesome, small heaps of bran put here and there will attract them, and they may then be caught and destroyed.

PREPARATION OF LAND FOR EARLY CROPS.—A south border or other warm spot in the garden should now be prepared for sowing or planting small areas with early vegetables or tubers, &c. If the soil be heavy or retentive, plenty of the spent manure from Mushroom-beds, charred refuse, leaf-mould, or potting bench siftings should be dug into it, the surface being left roughly as dug, to be mellowed by frost and wind. Light soils, on the contrary, if in need of fertilisers, will be improved by the addition of heavy soil, clayey loam, marl, and rotten manure.

ASPARAGUS IN FORCING PITS AND FRAMES.—Owing to the mildness of the season, there is no difficulty in keeping up the proper degree of warmth, and the produce has come along readily. Do not let the heads remain any longer time in the frame than is really necessary, as they soon spoil; but pull them up, cutting off the butt ends, placing them in small bundles upright in water, and keeping in a cool dark place till wanted for table. Asparagus keeps fresh in this way for several days. If blanched heads are asked for, cover the crowns with a layer about 1 foot thick of light sandy material, the principal part of which is half-decayed leaves, and gather the produce when the heads appear above it [or cover with flower-pots having the hole at the bottom closed]. Place successional batches of crowns in heat at intervals of three weeks. If the soil of the beds is getting dry, apply water at a temperature of 90°, and give a little air afterwards to admit of the escape of vapour.

PARSNIPS AND JERUSALEM ARTICHOKES.—These roots are not improved by being lifted and stored for any length of time before using them, a very little drying depriving them of their best qualities; a portion of the crop in the ground may therefore be covered over with tree-leaves to a depth of 6 inches to prevent frost entering the soil. Some strawy litter placed on the top of the leaves will prevent these from blowing about and making the garden untidy. Where Parsnips become much cankered if left in the soil, it will be advisable to lift the entire crop at this season, selecting the sound roots and storing them in moist sand at the foot of a north wall, and putting aside the unsound ones for present use.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

PEACHES AND NECTARINES.—Continuing the remarks on these fruits made by me in the Calendar of last week, I would recommend that a rather buoyant air be maintained during the flowering and setting time, and when a good set of fruit is obtained, syringing the trees daily with tepid water, and affording ample watering at the roots, will have the effect of seeing them through the stoning-period, at which stage the temperature of the houses should be 53° by night, with a genial growing warmth by day. Keep a look-out for aphis, making use of quassia-water and the syringe when it is noticed. Applications of quassia-water do no harm to the trees, whilst fumigation often injures the leaves. Succession-trees should be pruned, cleaned, trained, and everything in the houses put in readiness for a start when the proper time comes. To maintain a supply of fruits till out-of-doors fruits come into use, a house should be started every month from November onwards. For killing scale or mealy-bug on the trees, brush the latter with strong solution of soft-soap and rain-water, and then apply Lemon-oil or petroleum emulsion. The walls and trellis-work should be well washed with water, soft-soap, and petroleum, filling up with cement all holes that may afford lurking places for insects. Lay in the young wood, so that there is no crowding of the foliage, and so that the light can reach every part of the tree, or the fruit will be poor in colour and the wood weak. Apply dressings of loam and manure to the borders, and then water them copiously. Keep these trees as cool as possible.

PINE-APPLES.—Preparations may now be made for starting a batch of Queens for fruiting towards the end of May and later, selecting stout thick-set plants with a close rosette of heart leaves, which have been grown and rested as previously advised. When the bottom-heat is dependent on a bed of tanner's bark or tree leaves only, care must be taken in making it up to mix plenty of the old materials with the new, so as to obtain the requisite degree of heat, that is, 85°, without the risk of its getting too high. When the heat is obtained from hot-water pipes, its regulation is a matter of plenty of piping and the proper use of the valves. Before plunging the plants a few of the bottom leaves should be twisted off, the surface-soil pricked up, and some of it removed, top-dressing with good loam, pressing it firmly about the collars where the new roots will be emitted. Take care that sufficient space be left for affording water. Plunge the plants 2 to 2½ feet apart according to their size, and in doing so do not break or bend the leaves. After the plants are plunged, if any are known to be dry at the roots, afford these a good watering of weak guano-water at 85°. The bottom heat must be watched carefully if it is derived from tan or leaves, as the figure above given is high enough at starting; the state of the soil should be ascertained from time to time, and the drying of the bottom roots guarded against by affording thorough waterings when water is needed. If the bed gets too warm, lift the pots partially out of it for a time; which will let out the heat, and prevent loss of roots. The plants may be replunged when the heat declines. The temperature of the air by night should range from 60° to 65°, and by day 70° to 80°, with a little air afforded whenever possible, damping the floors but not the plants for the present.

SUCCESSION.—Fruiting plants which will not be started just yet, may still be rested, but not letting the soil get very dry, and keeping the temperature at 60° by night, and 10° higher with sun-heat and plenty of air. Plants with growing fruit should have a steady bottom heat of about 85°, and as much water at the roots as the plants require, as well as plenty of aërial moisture. Suckers may be potted and plunged in a mild bottom heat in a close pit, and kept there till the roots form, at which time water and air may be afforded them.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

THE GENUS PLATYCLINIS.—The several species belonging to this genus were once more commonly known under the name Dendrochilum, and they are pretty enough plants when in bloom. A plant of P. uncata standing in the intermediate-house at Burford Lodge is now in bloom. It has a resemblance to P. filiformis, but the thread-like racemes are shorter than in that species, and the flowers a trifle larger, and of a yellowish-green tint; while those of P. filiformis are of a uniform canary-yellow, and it is distinguished from that species by producing its flowers at the winter season, whereas P. filiformis usually flowers in June or July. Platyclinis uncata should be well supplied with water at the roots whilst in flower, and till the growth is completed for the season; it does well suspended in a light position in the intermediate-house the whole year round. At this season P. filiformis is at rest, and a light place in the intermediate-house, with the compost kept fairly moist, will suit its requirements for the present, but when growth re-commences, more warmth becomes necessary. The spring-flowering species, P. glumacea, is now starting into growth, and should be raised to a place near the roof of the East Indian-house. As soon as the young breaks are about 2 inches in length, they emit a number of new roots, which quickly enter the soil, and no time should then be lost in repotting those plants which require it. If repotting be not done at that time, it cannot be done till the flowers fade. From the present time onwards, this species should be liberally supplied with moisture at the root and overhead, the under sides of the leaves being also occasionally syringed to dislodge red-spider. P. Cobbiana must be allowed to remain in the intermediate-house till renewed activity take places, when it may be similarly treated to P. glumacea. The species above mentioned root freely in well-drained pots of peat and sphagnum-moss.

CALANTHES OF THE VESTITA SECTION have not retained their blooms nearly so long this season as usual, the very dense fogs having spoilt their beauty and freshness at an early part of the season. As Calanthes require a period of thorough rest, they should, immediately on the spikes being cut, be placed on a dry shelf, close to the roof of the warmest house, where the light will help to mature the growths. Water must be entirely withheld till after the repotting of the plants in the spring; and before removing them to their resting quarters, clear every pseudobulb from the white and brown scale insects which commonly infest them.

CHYSIS.—Such Orchids as Chysis aurea, C. bractescens, C. Chelsoni×, and C. Sedeni×, owing to the small amount of sunshine we received during the autumn, were much longer than usual in maturing their pseudobulbs, and even at this date some of them are not properly matured; but it will not be prudent to allow them to remain longer in the warm house with the great risk there is of their starting into premature growth, and forming no flowers. A safer quarter for them will be a house with a drier atmosphere; and while at rest therein they should be afforded very little water, just enough, in fact, to prevent shrivelling.

CATTLEYA LABIATA WARNERII.—Those plants on which fresh growths are now starting should be suspended close up to the roof at the warmer end of the Cattleya-house, or better still, in a light and airy position in the East Indian-house till growth be finished, returning the plants to the Cattleya-house to open their flowers. During the period of growth, water in sufficient quantities to keep the compost fairly moist should be afforded. The repotting will be better delayed till the flowers fade, as it is at that time that the plant makes the greatest number of roots.

PERISTERIA ELATA, an old, but still favourite species, the central parts of whose flower have some resemblance to a dove, succeeds in a stove temperature whilst growing, but now that the large pseudobulbs are mature, the drier Cattleya-house is the better place for the plant. This species requires a long rest, without which, however strong the pseudobulbs may be, flowering is problematical. The application of water during rest needs great care, and it is better to lean to the dry side than afford too much water.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

THE PLANTING OF EVERGREEN SHRUBS.—Advantage should be taken of open weather to push on with the planting of evergreens, more especially when the plants have not an abundance of roots or a good ball of earth. Although evergreens which have good balls of earth and roots may be transplanted with success in spring, such is not the case with poorly-rooted plants, which suffer greatly if drying cold weather follows the planting; whereas those which were transplanted in the autumn will have pushed out new roots by that time in sufficient numbers to afford the needful support. Newly-planted beds of shrubs should be well mulched with half-rotted stable-manure mixed with tree leaves.

ROSES.—Roses in beds should be mulched with farmyard-manure, not too much decayed, and if it be more in the nature of litter, if appearances need not be studied, it will be better for the plants. In cold or wet districts, and in heavy soils, Tea Rose bushes will be less injured by severe frost if the shoots are gathered up together, and a few bracken fronds or straw loosely fastened round them, earthing-up the stems slightly at the same time. Tender varieties of the Rose cultivated on walls may be covered up with mats and litter if very severe weather should occur, otherwise this mild season the less protection afforded the plants the better. Standard Tea Roses may be tied up in like manner to the bushes, inserting a few bracken fronds among the shoots, and shortening some of the longer of these.

CALCEOLARIAS.—Take advantage of the mild weather to remove the lights entirely from the frames; clear away all decaying matter and stir the surface. The cuttings of Calceolaria amplexicaulis, which were the earliest made, will now require to have the points pinched out to induce bushiness.

PANSIES AND VIOLAS.—The cuttings put in on outside borders should now have the ground cleared of tree-leaves and weeds, and a slight surfacing of sandy soil applied. As a protection against frost, place boards on edge round the beds, and a rough kind of trellis-work of bean-sticks over them, for the purpose of supporting the long litter or mats that may have to be put over them in hard weather.

GLYCERIN AS PLANT FOOD.—M. ASSFALL, of Erlangen, has shown that a solution of from two to five parts per thousand of water is sufficient to enable plants previously deprived of their starch by blanching to produce that substance when exposed to the light.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38°.1.

The Perfume of the Rose.

MR. FISH'S paper at the last meeting of the Horticultural Club on the perfume of the Rose, read at the last meeting, provoked a general discussion. In the course of his remarks, the lecturer insisted on the necessity that all new Roses, to be acceptable, must be endowed with fragrance. COLERIDGE, at Cologne, "counted two-and-seventy stenches, all well defined, and several stinks." Antithetically, we may state that Mr. FISH recognises an almost equal number and variety of fragrant perfumes in the Rose. The most deliciously-scented Roses according to him are La France, Goubault, Devoniensis, Maréchal Niel, Bessie Johnson, Madame Knorr, Charles Darwin, Gustave Piganneau, Horace Vernet, Jean Liabaud, Jean Soupert, Rev. J. B. Camm, Pierre Notting, Duchess of Marlborough, and Charles Lefebvre. Nearly all dark-coloured Roses are sweet, and some whites such as Augustine Guinoisseau, have a delicious fragrance. To Boule de Neige an odour as of new milk is attributed.

Among Tea Roses, Mr. FISH enumerated as remarkable for their fragrance, Adam, President, Devoniensis, Gloire de Dijon, Madame Welche, Mr. James Wilson, Souvenir de S. A. Prince (pure white), Princess of Wales, Safrano, &c.

Among the Noisettes, Aimée Vibert, Lamarque, Madame Carnot, Triomphe de Rennes, were alluded to; Moss Roses, the Austrian Briar, Harrisoni, the Provins, or Cabbage Roses; most of the China Roses, the Japanese species rugosa and polyantha, Anna Maria de Montravel, the white Banksian, the white Scotch, the Stanwell Perpetuals, Lord PENZANCE's hybrids from the Sweet Briar, and many others, came in for notice at Mr. FISH's hands. It is, however, not necessary to specify more illustrations, as, unfortunately, we have no means of defining the varied fragrance of which the Rose is capable, unless by comparison with others equally indescribable. Socrates has the odour of the Peach, others that of Violets, Pinks, Apples, Melons, Raspberries, Apricots, Hyacinths, Myrrh, Mignonette, Coriander, and even bugs!

Combining practical economy with his flights of imagination, Mr. FISH went on to enquire why we English people did not avail ourselves more largely of the opportunities for profit which the Rose offers us. He sketched the mode of growing Roses in Bulgaria, and the method of extracting perfume there and at Grasse, and he very naturally asked why we could not do likewise? Great Britain itself furnishes so many wild Roses that botanists have never been able to agree how many or how few varieties there really are. Some of them have the fragrance of Mignonette.

A factory near Leipsig for the extraction of perfume from Roses was described. About 85 acres are now given up in this neighbourhood to the cultivation of Roses for this purpose, Rosa centifolia and R. damascena being the varieties chiefly grown. What can be done in Saxony and Bulgaria can surely be done here, and hence the validity of Mr. FISH's contention.

Medicinal and other uses of the Rose were also alluded to, Mr. FISH in this matter acknowledging his indebtedness to Mr. SAWER'S treatise on the subject, to which we shall shortly have to refer at greater length.

Poetical allusions when the Rose is spoken of come unbidden into the mind, and Mr. FISH was characteristically unable to resist the temptation to indulge in them. He took for his text an expressive passage that may not be familiar to all of our readers, and with which we may therefore fitly close this note:

> "For green is to the eye, what to the ear
> Is harmony—and, to the smell, the Rose."

OUR ALMANACK. — Secretaries of Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1895, for insertion in the Almanack, to be published in our issue for January 5.

LILIUM GIGANTEUM AT FISHER'S HOTEL, PITLOCHRY, N.B. (See Supplementary Illustration.)—It is a charming scene that is depicted in our engraving on the opposite page, with its border of perennial plants and specimen of Thuya gigantea, with a fine vigorous plant of Lilium giganteum on the left, which, when in flower at the beginning of August last, measured 8½ feet in height, and possessed thirteen flowers of 11 inches in length. Mr. ROBERT PEARSON, the gardener at the hotel, to whose kindness we are indebted for the photograph from which the illustration was engraved, states that it was planted a few years ago along with some others, but no flowers have appeared previous to this year.

IMPERIAL INSTITUTE.—On Thursday afternoon, Dec. 13, Dr. SOMERVILLE, of the Durham College of Science, read a paper dealing with "Some Aspects of British Forestry." Professor SCHLICH, Ph.D, of Cooper's Hill, occupied the chair. The extension of sylviculture in this country was discussed chiefly as an agency for bringing profit to the landlord and benefit to the State. The absence of satisfactory returns from many of our existing woods was traced to excessive initial expenses, unscientific management, game, and the inferior quality and consequently low price of much of our home-grown timber. The poor quality of the timber was shown to be largely due to the way in which our plantations are managed, and especially to their being usually over-thinned, and too limited in extent. Reference to the Board of Trade statistics did not justify a common prediction that timber will become both scarce and dear in the near future. If, however, timber-exporting countries are cutting into their capital stock of trees, and are shipping more timber than is annually produced, a period of scarcity may arise with a suddenness of which the Board of Trade Returns need not be expected to give any indication. The desirability of the State purchasing land suitable for forestry as a means of providing employment in rural districts was strongly insisted upon. Sylvicultural operations, and the transport of timber to the nearest sawmill or railway station, necessitate the employment of approximately one forester or other workman to 50 acres of wood; while the conversion and utilisation of the timber employ an even larger amount of labour. It was pointed out that, at a low estimate, hill pastoral farms are attended to by one shepherd per thousand acres, so that forestry can find remunerative employment for at least twenty times as many labourers as pastoral farming.

NATIONAL ROSE SOCIETY. — The general meeting was held on the 13th at the Horticultural Club, Hotel Windsor, upwards of fifty members being present. As reported in our columns last week, the financial position is favourable, a balance of £72 11s. 9d. being shown. Members' subscriptions amounted to £374, while their present number is only two below the highest record, which, we believe, was in 1892. After the accounts were passed, Mr. E. B. LINDSELL and the Rev. A. FOSTER-MELLIAR were added to the list of Vice-Presidents; and Mr. A. SLAUGHTER, Steyning, with Mr. F. RIVERS, Sawbridgeworth, were appointed to their places upon the general committee. The Chairman (C. E. SHEA, Esq, Foot's Cray, Kent) had a difficult task in steering through the most interesting portions of the other business, the chief of which was the consideration of Regulation 13, with a view to altering it so as to read, "No person shall be allowed to compete as an amateur who sells Rose plants, Rose blooms or buds for budding." To this was added, "except new seedlings and sports." The most animated discussion followed, it being generally conceded that such practices had become far too general, and unless cognisance were taken of the matter, Regulation 13 was a dead letter. *Bonâ fide* trade growers or amateurs were asked for. It may seem, as not a few members expressed, a little hard upon those who cannot afford to let chances of partially meeting expenses slip by, but to sell blooms, buds, and surplus plants, and to ask for quotations from trade growers, is clearly to place themselves in the same position as nurserymen. Mr. C. E. CANT, Colchester, and Mr. G. MOUNT, Canterbury, confirmed the above practices. The last-named gentleman, in remarking that he had experience both as an amateur and a nurseryman, was eloquent in support of this alteration, which was adopted by a large majority. There was further discussion upon a second motion relating to the original regulation, Mr. E. B. LINDSELL and others asking that it should be made operative and binding, or repealed. There were no dissentients to this, but the majority felt very strongly that charges should be made out clearly and proved to the satisfaction of the committee before the offender was asked to resign or exculpate himself. On the other hand, a few wished more drastic measures, suggesting that any member might make a charge, and it should fall upon the accused to refute it. This side of the question did not find general favour; it was felt that no member would venture upon these in-and-out tactics after the full and warm manner in which the question had been discussed. An alteration was decided upon in regulation 7, which is of considerable importance: In future the plants must have been grown by and have been the property of the exhibitor for at least three months. This was not so much because of actual occurrences where both employer and gardener exhibited from the same plants, as the feeling that such an opportunity was open. Sir ALEXANDER ARBUTHNOT and others felt it would come hard upon affiliated societies where classes were distinctly made for both amateurs and gentlemen's gardeners. In the National Rose Society's exhibitions all must be members, but not so with affiliated societies. The motion was carried, presumably as a safeguard to the parent society. Chromatella and Cloth of Gold are to be retained, and Paul's Early Blush and Mrs. Harkness added to the list of synonymous Roses. A sub-committee was appointed under the style of a general purposes committee, to consider and report upon matters to the general committee, but to have no executive power whatever. It may be of interest to country members to know that the new catalogue fund not only cleared its expenses, but had a balance of £3 to hand over to the general fund of the society. The dates and places of shows

Lilium giganteum, Fisher's Hotel, Pitlochrie

during 1895 are Gloucester, June 27; Crystal Palace, July 6; Derby, July 17. It was also suggested that Reading be the place of meeting for the southern show in 1896, and Ulverstone for the northern show; this, we apprehend, will be subject to confirmation at the next general meeting. Notwithstanding the sharp frosts of late spring, it was pleasing to notice that the shows during 1893 were well up to the average, and the idea of a permanent southern show most popular. The revival and extension of this early meeting with the consequent extra expense, was felt to have paid its way.

Results of Crossing Cucurbits.—From certain experiments in the above direction it is concluded:—"1. That Pumpkins (Cucurbita pepo) and Squashes (Cucurbita maxima) will not hybridise. 2. That Pumpkins and Water Melons (Citrullus vulgaris) will not 'mix,' nor will Squashes and Melons 'mix.' 3. Cucumbers (Cucumis sativus), Sugar and Musk Melons (Cucumis melo) will not hybridise; nor will they 'mix' with Pumpkins. 4. The different forms of Cucurbita maxima will readily cross with each other, Mammoth Chili, Hubbard, New Prolific Marrow, American Turban, &c. 5. The forms of Cucurbita pepo, as the Long Warted, Nest-Egg Gourd, Vegetable Marrow, New Golden Bush, Bush Scalloped, Italian Striped, Perfect Gem, common Pumpkin, and Sweet Sugar, will readily cross with each other. 6. The hermaphrodite flowers of Musk Melon are self-impotent, and this is true also of some Squashes. 7. Certain varieties are prepotent, as shown in character of fruit, bine, and leaf. It is, however, often not well-defined, both parents transmitting equally." *"Results of Crossing Cucurbits," Bulletin No.* 23, 1893, *p.* 916—17, *Iowa Agricultural College Experiment Station, published* 1894.

Royal Gardeners' Orphan Fund, Concert at Altrincham.—The annual concert organised by the Altrincham Gardeners' Improvement Society in aid of the Royal Gardeners' Orphan Fund, was held at the Literary Institute, Altrincham, on Wednesday evening, the 5th inst. For such a worthy charitable object it was only to be expected that the public would signify their sympathy in a practical manner, and the result was that the large hall was packed to its utmost capacity. Several ladies and gentlemen well known in the musical world, and the fine band of the Altrincham Orchestral Society, kindly came to the assistance of the Committee, and their efforts met with hearty approval. From a musical point of view the concert was a grand success, and financially it exceeded all expectations, as after paying all expenses there was a balance of £50 10*s*, which sum has been forwarded to the Hon. Secretary, Mr. A. F. Barron. This is the third annual concert. Two years ago a sum of £20 was raised, last year £35, and this year the handsome sum named above. The committee worked hard to achieve this excellent result, and they are highly gratified with the success which has attended their endeavours. If other Gardeners' Improvement Societies organised entertainments on similar lines, the funds of this very deserving charity would be considerably enlarged.

Agricultural Statistics.—The Board of Agriculture has published a preliminary series of statistical tables showing the acreage under crops in 1893 and 1894, and other particulars of interest to cultivators. The total area under cultivation in 1894 in England is nearly 25 millions of acres (actually 24,880,717), about the same as in 1893. The area occupied by the principal cereal crops is about the same as in 1893, with the exception of Rye, the acreage of which was nearly doubled in 1894, viz, 81,239 acres, instead of 47,386, as in 1894. Peas, also, were more largely grown in 1894. The grand total for corn crops, including Peas and Beans, is given at 6·1 millions of acres (we omit the remaining decimals) in 1894, as against 5·9 millions in 1893. Green crops and hay crops occupied about the same area in both years. Small fruits in England occupied 62,457 acres in 1894, as compared with 1893, when 59,694 acres were thus utilised—an increase of 2763 acres. Similar details are given for Wales, Scotland, Great Britain, Ireland, and the United Kingdom as a whole, as also for each county separately. A general report will be issued after the close of the year.

Stock-taking: November.—Poetry is certainly not very nearly allied to trade and commerce; but a perusal of the past month's "Trade and Navigation Returns" certainly brings to memory the line, "Man never is, but always to be blest," for the "good time" is still to come, though, it must be confessed, there have been times when things were very much worse; and then, again, we have a good prospect. Though we have an increase of imports to the amount of £565,171, the decrease on the eleven months is just £7,105,067. True, considering the immense volume of the imports, this is not so very great a deficit; but the comparison ought to have shown an increase. There is the consolation, however, that the values of all imports, or nearly all, have largely decreased—so much the worse for the vendor. The following figures are extracted from the summary of imports for November:—

Imports.	1893.	1894.	Difference.
	£.	£.	£.
Total value of imports	35,801,961	35,236,790	—565,171
(A.) Articles of food and drink—duty free	11,836,973	11,531,293	—335,675
(B.) Articles of food and drink, dutiable	2,568,874	2,498,001	—70,873
Raw materials for textile manufactures	7,932,702	6,835,644	—1,097,058
Raw materials for sundry industries and manufactures	3,299,044	3,683,795	+384,751
(A.) Miscellaneous articles	1,640,460	1,491,384	—149,076
(B.)—Parcel Post ...	41,802	65,420	+24,618

The decrease in the value of tea imported, we may casually remark, is £108 000; and this fact may be used as a peg whereon to hang another—to wit, that we have been favoured by the Agent-General for Natal with the satisfactory information that the estimate for the next crop is 800,000 lb. For so very youthful an industry, these figures are very satisfactory, and considering the state of things in the East, especially the Tea-growing portion of it, there does not appear to be much fear of over-doing the industry in Natal. As for the imports of fruits, roots, and vegetables from abroad, we glean the following from the general mass of figures:—

Imports.	1893.	1894.	Difference.
Fruit, raw:—			
Apples ... ... bush.	602,210	1,179,595	+577,385
Cherries ... ... ,,	...	...	...
Plums ... ... ,,	2	1,538	+1,533
Pears ... ... ,,	43,170	59,331	+16,161
Grapes ... ... ,,	173,971	100,694	—73,277
Unenumerated ... ,,	36,051	58,768	+22,717
Onions ... ... ,,	419,275	597,601	+178,323
Potatos ... ... cwt.	49,295	151,005	+101,710
Vegetables, raw, unenumerated ... ... value	£ 52,298	£ 68,551	£ +16,253

These figures certainly do not decrease in value with the monthly record; but leaving them for the mastication of vendor and purchaser, we pass to the subject of—

Exports,

which show an increase in November over the same period last year amounting to £429,328, but the figures for the eleven months record a decrease amounting to £2,533,518. Had we had these last figures the other way round, it would have been a much more satisfactory record; as it is, the record for the month shows an improvement, much of which is due to the new American tariff, and here it may be recalled to mind that the President in his Message, on opening the parliamentary session, advises a larger concession to free trade—the free admission of coal and iron, and allowing all ships to be reckoned as American when bought by Americans and registered as American. The President hopes to encourage shipbuilding at home, and so keep freight profits in the hands of merchants and shippers. This latter is somewhat problematical, but the registering of ships built here means what may be termed "a big order." Furthermore, the prospects of trade with Italy seem more encouraging; and as the "P. and O." Company's dividends are looking up, we may conclude that trade in the East is improving.

Meeting of the Brussels Orchidéenne.—The most beautiful Orchid shown at the last meeting of the Orchidéenne, December 9, was Odontoglossum crispum antverpiense, from MM. Janssens & Vincent, of Antwerp (First-class Certificate of Merit, *à l'unanimité*); the flower is large, its divisions ivory-white, much spotted; the lip bears a large spot in the centre, the finely-cut edges are very much dotted. Cypripedium × Augusta (C. Spicerianum × C. Sallieri (?)), from M. Moens, has a splendid standard, bright red at the base, the mid-rib dark red, petals bright dark brown on the upper parts. C. × Fiveanum (C. Spicerianum × C. Harrisianum, from the same exhibitor, bore pale flowers; C. × Ivonnæ, from M. Linden, was of the C. × Leeanum class, and bore a fine well-shaped blossom. Maxillaria Lindeniæ and Brassia Finetiana, with flowers of a bright yellow, with clear brown spots, from M. Linden; Cypripedium × Leonæ, from M. le Dr. Capart, and C. × Lombaerdianum, from M. de Lombaerde, deserve mention as novelties. As good varieties, the following were remarkable:—Cypripedium × Harrisianum from M. Moens; C. × Harrisianum superbum and callosum, with a very large lip, and from M. Van Wambeke, Cattleya labiata Warocqueana; from M. de Lombaerde; Cypripedium × Leeanum Madouxianum from M. Madoux; Cattleya labiata Warocqueana and Cypripedium insigne var. from Dr. Van Cauwelaert. Three fine Orchids, remarkable for cultivation and bloom, were the following, from M. Van Wambeke, Lycaste costata, a splendid specimen, Oncidium cucullatum and Cattleya labiata Warocqueana.

Mr. Alfred Outram, who has represented Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, London, N., is severing his connection with that firm, after representing it for twenty-two years in Great Britain, America, and Canada. Mr. Outram has been an occasional correspondent of this journal. He will be at liberty to engage in a similar capacity with any firm desirous of being represented, and from his long experience and practical knowledge of the business, he is not likely to be long out of employ.

Shirley and Surrounding Districts Gardeners' and Amateurs' Mutual Improvement Association.—The monthly meeting was held at Shirley, Southampton, on the 17th inst., Mr. B. Ladhams presiding over a fair attendance of members. A paper was contributed by Mr. Jesse Jones, The Gardens, Terrace House, Southampton, on the "Cultivation of the Eucharis," illustrated by some capital photographs of a group and specimen taken from plants under his care. A hearty vote of thanks to Mr. Jones for his interesting paper concluded the meeting.

Messrs. B. S. Williams & Son.—This firm has opened a West-End establishment at 169, Piccadilly, for the purpose of extending their floral and decorative business. The premises are elegantly fitted, and brilliantly lit with electric light, so that the shop is an addition to the amenities of Piccadilly.

Peeblesshire Horticultural Association.—At the usual fortnightly meeting held on Tuesday evening, the 11th inst., a paper on "Bedding-out in Peeblesshire," was read by Mr. Jno. Cunnison, gardener, Kingsmuir Hall, who dealt with the subject in a practical manner, and dealt with plants and methods of treatment especially suitable for the county.

THE HORTICULTURAL COLLEGE, SWANLEY.—Mr. COLVILE BROWNE has resigned the office of Principal of this establishment.

CATTLEYA MAXIMA GIGANTEA.—We are not responsible for the apposition of these names. The original C. maxima was discovered by HARTWEG in 1841, but the special variety now to be mentioned was introduced to M. LINDEN's establishment, by WALLIS, in 1864. The plant, however, has gradually become rarer and rarer, so that it was till lately practically extinct. M LINDEN has recently re-introduced the species in its finest form, and in the *Orchidophile* speaks of pseudobulbs 40 centimètres in length, the flowers in clusters of eight or ten, and even twelve. As an autumn-flowering variety, it will be welcome, and a fit associate of the true Cattleya labiata.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.—The monthly meeting of this association, Dr. GROVES J.P., B.A., of Newport, presiding, was held at Ventnor, Dec. 1, 1894, when a paper was read on "The Chrysanthemum," by Mr. C. ORCHARD, of Bembridge. There were fine blooms of all the sections of Chrysanthemums staged to illustrate the essay. After the paper was read, questions were asked and remarks made on the peculiarities of different varieties. The general failure of Golden Wedding throughout the country seemed to be an insoluble problem. A hearty vote of thanks was accorded the chairman, essayist, and those who had staged blooms and plants.

THE LATE DR. BENNET.—A monument to Dr. JAMES HENRY BENNET to whose efforts the reputation of Mentone as a health resort is largely due, was unveiled there on Thursday in presence of a large crowd of people, including the local authorities, the foreign consuls, and the principal medical men of the Riviera. It will be remembered that Dr. BENNET's conclusions were largely based on his observations on the growth of plants as affected by climate. These observations were first published in our columns, and afterwards incorporated in his well-known book *Winter and Spring on the shores of the Mediterranean.*

PETWORTH HORTICULTURAL SOCIETY.—On November 28 and 29 there was held at the Town Hall a successful show, the first autumn show the Society has held. The Chrysanthemums were, as a whole, past their best, but Mr. WELLS and Mr. LETCHFORD exhibited some grand cut blooms. Lord LECONFIELD's gardener contributed a handsome group of miscellaneous plants; as did also Miss MCRONALD, Chichester.

"THE FRUIT-GROWERS' YEAR-BOOK" (Cable Office, 30, Fleet Street, London).—This is a very useful little publication, containing, in addition to a calendar and practical directions for each month, essays on fruit culture, by Mr. B. WELLS, Mr. E. MOLYNEUX, on packing fruit for market, fruit-drying, jam-making, &c. An account of Mr. ROCHFORD's vineries at Turnford, near Cheshunt, where there are 25 acres under glass, is given; and similar short notes of the nurseries of Messrs. RIVERS and BUNYARD. A classified directory of fruit growers in each county of the United Kingdom will be very valuable for reference. One objectionable feature we may note is the intrusive manner in which the advertisements are mixed with the text. Indeed, the mercantile element obtrudes itself throughout the book in a way that is hardly calculated to inspire amateurs with confidence. The object of the compilers would be better attained if the advertisements, overt and covert, were kept in their proper places. The book should be in the hands of all growers for market.

HORTICULTURAL CLUB.—The usual monthly dinner and conversazione took place at their rooms in the Hotel Windsor, on Tuesday, the 11th inst., the chair was occupied by the Vice-President, Mr. HARRY J. VEITCH; amongst those present were Sir Alex. Arbuthnot, Messrs. Bunyard, Moss, James H. Veitch, D. T. Fish, Peter Veitch, Ironside, C. Pearson, and Harrison Weir. The discussion was on the odour of Roses, and was opened in an exhaustive paper by Mr. D. T. Fish. Many of the members present afterwards joined in the discussion, and a hearty vote of thanks was given to Mr. Fish for his paper.

CORNWALL IN DECEMBER.—Mr. HOWARD FOX obligingly communicates the following list of plants flowering at Rosehill, Falmouth, in the open air on December 16, 1894:—

Abutilon megapotamicum
" Boule de neige
" Crusader
" Prince of Wales
Acacia from Wynberg, 2-year-old, 8 feet high
Acanthus mollis
Actinotus
Andromeda formosa
Aralia Sieboldi (Fatsia japonica)
Azalea amœna
" Double White
Begonia semperflorens
Berberis Bealbei
Brugmansia sanguinea (profuse)
Choisya ternata
Cistus florentinus
" hirsutus
Coronilla glauca
" viminalis
Corydalis lutea
Cyclamen Atkinsi
Desfontainea spinosa, also in seed
Diplacus glutinosus
Erica carnea
Escallonias, white and red
Eugenia apiculata
E. ugni
Eupatorium, shrub, 7 feet high
Fragaria indica, also in fruit
Fuchsias, in vars.
Genistas, in vars., 12 feet high
Grevillea rosmarinifolia
Helianthus (new miniature)
Heliotrope
Hellebores, in vars.
Hydrangea quercifolia and other species
Iberis Pruiti
Japanese Anemones
Jasminum nudiflorum
Lantana
Leptospermum baccatum
Leycesteria formosa
Lobelias
Magnolia exoniensis
Marguerites
Marigold (Cape)
Mühlenbeckia complexa
Nicotiana affinis
Œnothera macrocarpa
Olearia Gunniana
Phlox Drummondi
Pittosporum Tobira
Polygala Dalmaisiana
Primula obconica, &c.
Salvia (red-flowered shrub)
Saxifraga crassifolia
Schizostylis coccinea
Skimmia japonica
" longifolia
Solanum jasminoides
Tropæolum canariense
Tussilago Farfara
Veronica anomala
" diosmæfolia
" glauca cœrulea major
" ligustifolia
" parviflora, &c.
Viburnum rugosum

Also Acacia dealbata, 20 feet high, in bud ready to burst; Benthamia fragifera, in fruit Madras Citron, in bud and fruit; Senecio petasites, in bud, 6 feet high.

THE PARENT LARCHES AT DUNKELD.—Some few years since, we published illustrations of these historic trees (see *Gardeners' Chronicle*, February 12, 1876, p. 200), and of some of about the same age at Linley, Shropshire. The Dunkeld Larches were planted in 1738, and the two remaining ones were measured, says *Nature*, in 1888, with the following result:—

	Ft.	In.
Height	102	4
Circumference:—		
3 feet from ground	17	2
5 " "	15	1
17 " "	12	10½
51 " "	8	8
68 " "	6	1

Our contemporary merely gives the measurements of one of the trees he mentions. Although the date given for the introduction of the Larch is 1738, the tree is mentioned by PARKINSON in 1629 (see *Conifer Report, Royal Horticultural Society*, p. 14).

It is interesting to see what was said about the Larch at that time, on which account we give the following extract from the *Paradisus*, p. 608:—"But in our Land being rare, and noursed up but with few, and those onely louers of rarities, it groweth both slowly, and becommeth not high . . . . . The blossomes are very beautiful and delectable, being of an excellent fine crimson colour, which standing among the greene leaues, allure the eyes of the beholders to regard it with the more desire: it also beareth in the naturall places (but not in our Land that I could heare), small soft cones or fruit, somewhat like vnto Cypresse nuts, when they are greene and close."

ELECTRIC LIGHT IN HORTICULTURE.—Some day, perhaps, when every other civilised nation has adopted it, our growers may think it worth their while to make enquiries about the use of the electric light in the culture of plants. The experiments of the late SIR W. SIEMENS were duly recorded and illustrated in these columns some years since, and they were so remarkable, and, so far as they went, so conclusive, that the success of the enterprise commercially even then seemed only a matter of time. In the meantime, our American brethren have stolen a march upon us, and may be trusted to attain "results of direct economic value" some time before we do. We have already alluded to the results in the case of Lettuce-culture, and recommend those interested in the subject to read the "Essay on Electricity and Plant Growing," by Professor BAILEY, Professor of Horticulture, Cornell University, Ithaca, New York, in the *Transactions of the Massachusetts Horticultural Society for the Year* 1894, p. 54.

MARKET PRICES IN THE METROPOLIS.—One of the most interesting features in the second part of the *Journal of the Board of Agriculture*, just published, is a series of tables, in which is set forth the monthly mean prices, wholesale, of fruit, at Covent Garden, Farringdon, Borough, Spitalfields, and Stratford Markets, derived from the pages of the *Gardeners' Chronicle* week by week. It is satisfactory to find our endeavours appreciated by a Governmental department.

CHRISTMAS TREES.—An essay before a recent meeting of a Forestry association deplores what it terms the "craze" for Christmas trees, by so much, the author insists, fostering a spirit destructive of the growing forests. To our mind says *Meehan's Monthly*, for November, that which gives human pleasure is not waste—and what pleasure does not float around the memories of the Christmas tree! Even from the timber-growing standpoint, little harm is done, as in the Atlantic States they are confined chiefly to red Spruce and Balsam Fir—not by any means of great import in timber calculations. Kinds that are valuable for timber rarely come in. It is to be regretted that the first inventor of the Christmas tree cannot be known, and a monument built to his memory. The idea originated in Germany. The legend is that the Christ-child, disguised as a vagabond, went to a cottage for shelter, and was not turned away. The forester made him happy. It was Christmas, and the wanderer took a sprig from a bunch of green on the mantel and planted it by the cottage door. For ever after as it grew, on Christmas day, it was loaded with gifts which it bore for the forester's family. Thus far in the realm of story lies buried the good deed of the inventor of the Christmas tree.

THE DIVINING ROD AND ITS USES.—Messrs. BAKER & SON, 25, Paternoster Square, London, have published an essay on this subject by Mr. E. VAUGHAN JENKINS, and Messrs. T. F. YOUNG & R. ROBERTSON. It is rather strange that the subject has not been investigated by our electricians and seismologists, and that galvanometers and other instruments which must be much more delicate in their indications than human "media" have not been turned to account to prove or disprove the allegations made. Though perverted and distorted almost beyond recognition, there is generally a grain of truth in popular belief, however superstitious. It is not only that some people are alleged to have this faculty, while the majority do not possess it, but the nature of the rod has to be taken into consideration. "A green Hazel rod full of sap" is preferred. "The Fern," meaning we suppose the bracken, is said to be very sensitive, and "the most active," used by the two writers above mentioned, "is the Douglas Fir." We are afraid there is not much to be got out of this assortment, but if any one wishes to know how it is done, let them read the present book, which whatever we may think of some of the stories in it, bears the impress of good faith on the part of the writers.

PRESENTATION TO MR. THOMAS LOCKIE.—This well-known and highly-esteemed gardener, who has left Oakley Court, Windsor, to take charge of the gardens at Doddington Hall, Huntingdon, succeeding the late ROBERT PETFIELD, was entertained at supper at the Swan Hotel, Clewer, by thirty of his friends, including many of the leading gardeners of Windsor and the surrounding district, Mr. HARRY TURNER, Slough, taking the chair. After supper and the reading by Mr. CHERRY of a sympathetic address,

Mr. [Turner, on behalf of the committee and subscribers, presented Mr. Lockie with a handsome gold watch and chain, and Mrs. Lockie with a diamond brooch. Mr. Lockie was twenty-two years gardener at Oakley Court.

Publications Received.—*The Journal of the Board of Agriculture* No. 2.—*Millet Bulletin of the Michigan State Agricultural College Experimental Station.*—*Revision of North American Cacti, &c.*, by John M. Coulter, United States Department of Agriculture, Division of Botany.—*Peach Yellows and Peach Rosette*, by Erwin Smith, United States Department of Agriculture.—*The Effects of Spraying with Fungicides on the Growth of Nursery Stock*, by T. Galloway, U.S. Department of Agriculture, Washington.

Fig. 97.—Cypripedium William Lloyd: flowers rose and crimson.

Amateurs' Column.

Peaches, etc.—I noted in the *Gardeners' Chronicle* recently, an article on Peach growing in Belgium, and how very successful it is, and that it brings £600 000 of foreign money to the pockets of the Belgian people. Beyond this, I saw a few days ago a friend of mine from California, and he told me how great breadths of land are being covered with Peach trees, and that some of the fruit they will probably bear will some day be over here bright and fresh, and no doubt it will; and then the French Peaches that also come, and I hear that hereabouts the wall Peaches have done fairly well, so we are not likely to be "wanting" Peaches, but for all that, I as an amateur like growing my own. Many years ago I planted a standard Peach tree, I think it was called Early York. It grew well and bore, and ripened much fruit, but they were small, yet the flavour was good. This being in my mind, I spoke to my friend Mr. Francis Rivers about having another trial. He kindly presented me with three pyramid trees, one Early Louise, one Early Beatrice, one Alexander. Well! every gardener knows of the disastrous spring frost we had here, this spoilt our Strawberry crop, our Apples, &c. At this time my Peach trees were in full bloom, so I gave up all idea of a crop, especially as the Gooseberries close by were browned and many fell off. But no! It was not so, both Early Beatrice and Louise set a very good crop, so much so, that I had twice to thin them, cutting off over two dozen from each. Being small trees I left about a dozen and a half on each, all which though not large, ripened on or about August 1, and were of good flavour. The Alexander came a little later with much larger highly-coloured fruit, there were fifteen, as the tree was not well set for bloom, they ripened thoroughly and were delicious. There is another variety that I must get, and that is Waterloo, I have seen standards of this loaded with bright red fruit, and good in flavour. Besides having the fruit, the blossom is pretty, and the foliage and the style and growth of the tree is graceful. Now what I am coming to is, Why do not more amateurs grow standard or pyramid Peach trees? there are plenty of warm nooks where they would do well, though mine are fully exposed to very rough winds, yet they have done well. Why buy foreign fruit, when we can so easily grow our own, and not only that, but have the pleasure of seeing them grow. I grew some good-looking Pears this year, but none of these had much flavour. The wet weather was too much for them. Catillac was very large. Durondeau was the best flavour, but the blue tits spoilt a large number, in fact, all on one pyramid. By far the handsomest Pears that I have seen this year, and the best flavoured, are some I bought at two different times, they were delicious and wonderfully juicy — they came from California. *Harrison Weir, Iddesleigh, Sevenoaks, Dec.* 11, 1894.

Cypripedium William Lloyd.

This richly-coloured Cypripedium (*see* fig. 97) is a hybrid obtained from a cross between C. bellatulum and C. Swanianum, and was shown before the last meeting of the Royal Horticultural Society by Mr. P. Weathers of Silverhall Nurseries, Isleworth, when it received an Award of Merit. In our report of that meeting, we described the flower as resembling C. Chas. Richman, in the dark rose and crimson colour which suffuses almost the whole of the surface.

The broad upper petal has feathered crimson-purple lines, and the substance of this beautiful flower generally is thick and wax-like.

Home Correspondence.

The Gardeners' Royal Benevolet In Titution.—It appears to me that many gardeners who desire to see impartiality upheld, will feel a debt of gratitude towards "Enquirer," whose letter appeared in your last issue. As sure as the elections come, so are the enclosed weighty epistles sent forth; no name or place of the sender is visible; surely it is not distributed owing to the names attached for catching votes or influencing other voters away from the most deserving. It is evidently not wise, and certainly not fair towards others whose opportunities have not been so favourable for obtaining such signatures. I have been closely connected with similar funds from their commencement, and even in committee I have never thought it right to advocate candidates either at the meetings [or otherwise, and for the same reasons I have never voted, feeling that the majority of outside voters would, after seriously considering each applicant's position officially set forth, do the deciding according to their honest convictions. I do think that trade influence should not appear, and that a correct basis should be adopted under such conditions. I am glad the subject has been approached, and sincerely hope both sides will be impartially discussed. *Henry Cannell, Swanley.* [The epistle referred to was an appeal for support of a particular candidate, backed by a statement that his petition was signed by the treasurer and five members of the committee. Ed.]

—— Gardeners have been frequently rated, because they, as a class, do not subscribe in greater numbers to the above excellent Institution, the claims of which should specially appeal to their generosity; but if the communication of "Enquirer," p. 729, is correct, I am afraid it will not enhance the prospects of their so doing. In the official list of candidates I have often noticed the recurrent phrase—"been a gardener all his life in the neighbourhood of so-and-so." Now, I myself have had several changes since I began my gardening career, and I know many more that have had a similar experience; some manage to drop into a berth where they can remain, and such fortunately seldom have recourse to the benefits of the Institution. Therefore it would be somewhat difficult to give a full description of each candidate's gardening career, but certainly the irony of fate is exemplified in "Enquirer's" note, another rendering of the eleventh hour labourer in the vineyard! Was the erstwhile shoemaker elected on the pension list? or will he be put up again? if so it would be only right and fair to candidates that have been gardeners all their life, to have full particulars given next time. Being a subscriber, I should feel very hurt if, in years to come, a turn of that treacherous wheel of fortune necessitated my name being placed on the list of candidates, —and then—oh, then! to find myself elbowed out by one of the same standing as mentioned by your correspondent. *Pathfinder.*

—— "Enquirer's" letter, page 729 is of a somewhat startling nature, and, assuming it to be a fair statement of the facts of the case, it certainly requires

the attention of all who are interested in the welfare of our good old Institution. Residing, as I do, at a considerable distance from London, I am not often brought into contact with those who more directly have the management of it, consequently I am not acquainted with the minor details of its working. Looking at the names of the Committee as published annually, we should expect that the persons named would surely not allow the claims of a person (however worthy he may be) who did not enter upon an horticultural life until forty, to be called a gardener in the sense that this Institution was and is intended to benefit. We subscribers at a distance have to rely on the remarks of the Committee that are published each year about the respective candidates. Hence the necessity of these remarks being based on facts. The age when each candidate enters his gardening career should always be stated. As one who has not only subscribed for fourteen years, but who has also done some little in other ways to further the interests of the Institution, I shall await with interest some explanation from the management as to the charge of "Enquirer." *H. J. Clayton, Grimston, Tadcaster.*

CHRISTMAS REQUIREMENTS.—At pages 689 and 690 of the *Gardeners' Chronicle*, a "Market Gardener" introduces a very interesting and varied assortment of plants, fruits, and flowers available for this season. But among the cut flowers I notice that no mention is made of two at least of our never-failing Christmas flowers, viz., Chrysanthemums and Poinsettias. The former of these has an importance of its own, and so, indeed, has the latter plant, from a decorative standpoint, though, of course, the coloured bracts that are so generally admired at this time have nothing to do with the true flowers. For church decoration, however, both plants are in great demand; indeed, are really indispensable at this time. For its decorative and market value, the Chrysanthemum cannot easily be superseded, and especially is this the fact when it is remembered that these flowers are forthcoming at Christmas-time in both yellow and white. The adaptability of their flowers to the ordinary sitting-room or public building, where artificial light is used, makes them quite indispensable at Christmas-time. The duration of the blossoms of some varieties is also very noteworthy. For decorative purposes at this season we have no white that can equal Lady Lawrence, the purity of its flowers being all that can be desired, while its lasting properties are great. This variety may be easily carried over into the new year, and still be fresh and good. Another excellent late white is Lady Canning, the flowers of which are very pure. In this case the plant is possessed of a dwarf bushy habit of growth, that will render it most welcome as a pot plant for furnishing. Whether this latter is going to be sufficiently free-flowering for the market-grower has yet to be decided. Yet another dwarf white variety, which must not altogether be overlooked, is Boule de Neige. It is an old variety, certainly, and not a first-class flower, but there is this about it, that it may be relied upon for Christmas work, which is an important point to nurserymen and florists, who supply cut flowers for decorations. Then among the yellows we have Mrs. Hogg and W. H. Lincoln, both excellent in their way, and also distinct. There is also Golden Gem, a flower the colour of which is variable, and the name too frequently a misnomer. The terminal blossoms are generally yellow, and often of a pleasing shade. Kate Mursell, the beautiful primrose sport from Lady Lawrence, is also a charming flower equally late in flowering as the original. These by no means exhaust the list of Chrysanthemums suitable for and obtainable at Christmas; and I should not omit to name Eucharis grandiflora, double-flowered zonal Pelargoniums, forced Lilac, with its delicious fragrance; and paper-white Narcissus were in great quantity on the principal markets of this country. *Another Market Gardener.*

MR. BLACKMORE AND FRUIT CULTURE.—It is difficult to discover a cause for the crusade that Mr. Blackmore has preached against fruit-growing; the 10 acres of land, which have not been profitable to him, can hardly constitute a basis to attack one of the industries of the nation. I am told that in Devonshire thousands of acres are occupied by worthless and worn-out trees, from which a very nasty drink, called cider, is manufactured; the fruit for this beverage is generally battered from the trees (poor old things), gathered up from the soil, and thrown into heaps, rotten and sound, and all nauseous. The superstition that these repulsive Apples can make good cider ought to be smashed, abolished, and trampled upon by the Devonshire worthy, Mr. Blackmore, and he will then do good service to his county, but the "boom" will not be very tremendous; the annual net profit of some of the brewery companies would probably buy up all the growing stock of fruit-trees in the United Kingdom, and the re-planting of one county would tax the resources of all the English fruit-tree growers (so much for the "boom"). Let the replanting, however, be done with the finest sorts of dessert and culinary Apples, the cider will then be worthy of a refined taste, fine Apples will make fine cider, and the so-called cider Apples return to the limbo of ignorance from which they were drawn. Under Mr. Blackmore's leading, Devonshire will again become a source from which a fine English drink will be a blessing in disguise to the whole country, wholesome, pleasant, and inspiriting, and which can be produced as cheaply as the horrible stuff which sometimes passes as cider. *T. Francis Rivers.*

FRUIT AND FICTION.—There must be something fascinating in Mr. Blackmore's letters treating of what he calls the "wretched delusion" of fruit-growing to ensure the insertion of such rhapsodies as he writes. He asked for one instance only of a successful fruit-grower. I gave him two, but he is unconverted. If such evidence would convince him I think I could engage to cite him two successes to every one of his failures. Failures and successes there are in every business—not only in fruit-growing, but in literature as well—yet, if Mr. Blackmore cites his own experience in literature, would he advise failing fruit-growers to become literary men? I think not—nor would it be wisdom to say, because there are literary failures that literature is a "wretched delusion"—yet one is as important as the other, and both must be developed, and both will receive attention in spite of all opposition, and both businesses will have its successful operators and failures. It is so with every business or profession. The crucial test to success in almost anything is the compulsion—most persons are compelled to do something to live and better their condition, and as a rule they are forced to stick to it or fail, and that means ruin. Hundred of cases might be cited. Look at Gilbey's firm—there is an instance. Rumour says that they were nearly spun up at the beginning, but to wind up meant ruin, so they stuck to business till success dawned upon them, and now look; and it is so with thousands more. Look at the great fruit-growers of to-day, to name them would be a task for the numbers are so great. Does this view show it to be a "wretched delusion." It is mere twaddle to say so, and an unjust reflection on respectable men. It is a pity this controversy on so great a subject should drop before it is well thrashed out, and no partiality should be shown in altering or cutting out expressions in the correspondence, but fairness should be exercised all round, and Mr. Blackmore forbidden to abuse men engaged in a great industry by such phrases as "fatal fad," "wretched delusion," and other such choice terms, for there are persons who take notice of such things, to the real injury of themselves and others. *B. Wells, F.R.H.S., The Fruit Nurseries, Crawley.*

THE SEASON.—As an instance of this mild season, I may state I found a full grown Strawberry in my garden here, nearly ripe, on Nov. 18, and one before that date, they are still blooming; to-day I find the buds on fruit-bushes and Raspberries are moving; Primroses in the woods are looking gay. I send twigs of two old shrubs I knew more than sixty years ago, not often seen now, Caronilla emerus, or Scorpion Senna, and Tamarisk, grown more by the south coast, blooming freely. I have seen beautiful hedges in gardens clipped or knifed to 3 feet or more, are very ornamental; a tree here is about 16 feet high, very useful to cut from as greenery. We have had several degrees of frost, on Dec. 4, 10°, thermometer 22° at 4 feet from the ground. *W. Divers, Heath Cottage, Linton, Maidstone.*

EUCHARIS.—Having seen your illustration of a pot of Eucharis grandiflora in a recent paper, I should like to say a few words respecting the very successful cultivation of the plant by Mr. Taylor at Belmont, Wimbledon: there are twenty-two pots of bulbs ranging from 8 to 12 inches in diameter, each of which recently carried from twelve to twenty-one spikes of flowers; they occupy the side of a low span-roofed house, and seem quite at home—they were thought worth photographing. *Admirer.*

DOUBLE LYCASTE SKINNERI.—A few weeks ago one of my plants of Lycaste Skinneri bore two flowers on a spike, which fact I communicated to the *Gardeners' Chronicle* (see issue for December 1, p. 675). Another plant in my collection is now showing two buds on one spike. In the case of both plants, the spikes simply bear two distinct flowers. Another occurrence of the same kind here in the autumn was that of a plant of Cattleya Bowringiana had fourteen flowers on one growth. *N. Blandford, Bitterne.*

FRUIT AT THE DRILL HALL.—The very fine collection of culinary Apples staged by Mr. G. Bunyard at the last Drill Hall meeting of the Royal Horticultural Society certainly attracted the attention of the visitors, but to show them on plates taught no one anything. I venture to suggest to Mr. Bunyard that it would be of greater service to an aspiring fruit-growing nation, were he to set an example at some future meeting to market growers of Apples how to tastefully and conveniently pack their fruit for sale in a way that will command the patronage of the grocer and the admiration of the public, in the same way that so much of imported fruits are submitted to public attention. The foreigner caters chiefly for the high-class shop-keeper and the great stores. Our home growers chiefly for the greengrocer and the costermonger. With such a fine lot of fruits as Mr. Bunyard has, and some other growers also, what capital object-lessons might be at the Drill Hall furnished! We want to see our Apples sized, neatly packed in very cheap boxes or crates, and in moderate quantities, rather than in bushel baskets. *A. D.*

WATER-TIGHT STOKEHOLES.—On page 701, Mr. Jenkins gives directions for making water-tight stokeholes. Bricks and cement used as he states, however, would be a heavy item of expenditure, and likely to deter many from undertaking such work. Water is a difficult element to keep in and keep out, and a guarantee of success would be risky after all his expensive process. I have maintained, and still do, that an iron tank is more effectual and economical than bricks and cement. The pipes, both flow and return, must of course be carried over the top of the tank. The bottom of the tank in front of the furnace, and where the shovelling is done, should have loose sheets of iron laid on to prevent wearing the bottom of it. But why have a sunk hole at all? Why not place the boiler on the ground level? I am well aware of the prevailing opinion that the whole of the pipes must be above the boiler, and have also a gradual rise the whole of their length, but this notion is erroneus, for the boiler will do its work as well if above the pipes as if set below, and a house 200 or 300 feet distant from it, though it may be a few feet lower, can be heated to any degree, according to the number of pipes put in. We have a structure in this establishment heated by a boiler that is 2 or 3 feet above its work; the boiler is set on the ground level, and the pipes below. Mr. Dillworth, of the late firm Metcalfe & Dillworth, Preston, has heated several ranges of houses in gardens near the coast, and in low-lying districts, without excavating a stokehole at all, and he recently informed me that difference of levels presented no obstacle to him. *W. P. R., Preston.*

NE PLUS ULTRA PEA.—This variety was distributed from here by Mr. Brownlees, whose family resided at this place for over sixty years, and not from Berkhamsted, as stated in the article on the "History of the Pea" in your last week's issue. *W. Eoden, Marlow's Nursery, Hemel Hempstead.*

THE BLACK CURRANT MITE. — Amongst the members of the old school of gardening it is likely that they, not having had the advantages of the present generation in becoming acquainted with the habits of plant-pests, and the appearance of fungus diseases, labour under the delusion that because they have not seen or heard of them, the whole must be a myth; this, at least, appears to be the case with one of your correspondents in relation to the Black Currant mite (Phytoptus ribis). I made the first discovery of this troublesome insect about twelve years ago, but at that time did not know where to find any information regarding it [you did not read your *Gardeners' Chronicle*, where it was fully described at that time!]. However, I was able to rid the garden of it by burning all the affected bushes. Since then it has been my good fortune to become acquainted with some of the writings of Miss E. A. Ormerod. I would strongly advise "A. D." and, in short, every gardener, to invest 5*s.* in the

Manual of Injurious Insects, and Methods of Prevention," by that author, as it contains much useful information about most of our worst insect foes. At p. 603, "A. D." makes bold to assert that the Black Currant-bud mite is only to be found on badly-grown plants. This much may be granted him, that weakly plants are sooner overrun than vigorous ones, simply because the latter afford a much more limited area for the insect to cover. The truth is, health has nothing whatever to do with the presence or absence of the mite, and this "A. D." will learn should it ever find its way to the Currants under his care (I presume he is a grower). Twelve months ago I had occasion to give a lecture in one of the villages on the estate of my employers, and as the mite had been one of the worst enemies of the cottage gardens, I was asked to make a specialty of this subject. I responded to the request, and strongly urged all those whose bushes produced abnormal buds (like the specimens I had), to dig up and burn them. This was done, and young plants supplied from the gardens under my care, free of cost, with the result that not a vestige of the mite can now be found. Facts are oftener stronger than fiction, and this, perhaps, "A. D." will admit when I tell him that all the cottagers on this estate have exceptional inducements to cultivate their gardens well, and that it was in the garden bearing the highest number of marks for cultural merit that the mite had made the most headway. Stunted growth and bad cultivation were not to be found within the enclosure, and is it not more rational to think that the Currant-bud mite would increase most on bushes in a robust state of health, with good fat buds for them to feed on, instead of on starved plants? Moreover, is it not when rabbits find abundance of food that they increase the fastest? *Phytoptus.*

LOBELIA CARDINALIS.—What a showy, useful free autumn-flowering plant is Lobelia cardinalis! Yet, strangely enough, it is not often met with now-a-days in private gardens. The spikes of scarlet flowers rising from 2 to 3 feet high out of tufts of long, narrow, bronzy foliage, are very telling in effect, either planted in single rows in shrubbery borders or in irregular masses some 3 to 4 feet from the walk in herbaceous borders, in which latter position they form a striking contrast to the plants with which they are associated, such as Michaelmas Daisies, of various shades of colour, Pyrethrum uliginosum, and Anemone japonica alba. And in a cut state the Lobelia cardinalis keeps fresh a long time, if put into water as soon as cut, and it is admirably adapted, in conjunction with long-flowering shoots of the above-mentioned plants, for filling large vases for the decoration of rooms. Recently I noticed a long row of Lobelia cardinalis in fine flower in a border close to the several ranges of glasshouses in the nurseries of Messrs. Keynes, Williams & Co., Salisbury. The plant has everything to recommend it, being a good grower in any garden soil of average fertility, and easily increased by division of the roots. *H. W. Ward.*

LARGE EXHIBITS AT THE DRILL-HALL MEETINGS.—The resolution passed unanimously at the ordinary meeting of the Fruit Committee of the Royal Horticultural Society held on October 23, inviting the Council to place restrictions on the number of dishes of fruits exhibited by any one firm or person at any one Drill-Hall meeting should, if adopted by the Council, be productive of some good results. Certain evils now result from the present system: First, we constantly see a large number of the most unmeritorious sorts exhibited, which would be better left at home; and further, even of known good sorts, many inferior samples are often staged for the purpose of making up big collections. Such exhibits have no interest, add nothing to the attractions of the meetings, and are not at all the sort of things the meetings are established to encourage. Secondly, these huge collections too often cramp and confine space for many other small but not less interesting exhibits. Thirdly, there is growing up a sort of running competition for notoriety as to the presenting the largest collections. Where is it to end? These are the reasons which prompted the Fruit Committee to take action, that body being driven to their wits' end to find suitable awards, the range being exceedingly limited. However, it has been pointed out that fifty dishes, assuming the restriction be adopted by the Council, might be interpreted as fifty baskets, which would mean a huge collection again. Still, limited to fifty sorts, there would be much gain. Yet I think the wisest course would be to take the bull by the horns and rigidly limit every exhibitor to a maximum of table space, leaving him to fill it as he may. That could be so determined as to cut down the huge collections of to-day to something like proper limits. I personally do not complain of any one or of all the exhibitors. The system complained of has grown up gradually. Its objectionable nature was specially impressed on the fruit committee, when making certain awards, because it was felt that space and numbers did give undue advantages. Of course, it is the trade houses that chiefly create the difficulty, and not private gardeners. It is so rare that these latter require unusual space, that what they have done calls for no comment, beyond saying that in some respects the collections of vegetables shown on October 23 were the most representative ever seen. Still, the very highest award having been made, such another collection will hardly be repeated. None the less, any restrictive regulation should have general application. Then it is hoped that the council will not mind helping the committee in the matter of awards, so far as to lay down a regulation as to awarding the highest, a gold medal, an award that is eagerly sought for, but which ought to be very hard to gain. It is sometimes rather invidious to distinguish as to the relative merits of unlimited collections, but once these are restricted to equal numbers or areas, then each one can be dealt with on its absolute merits. I have not much sympathy with those persons who want to make the Drill Hall meetings into shows. It is true that nothing can be more welcome than very meritorious objects, and if all the exhibits at those meetings were distinctly meritorious, there would be nothing to find fault with. But we have to see a good deal that is very common-place, and such things if they fill the tables, at least, add nothing to the dignity, interest, or attractiveness of the meetings. Whilst it may be said, what would the meetings be without the trade collections, it may be retorted what do the meetings gain from very much of this trade material? I do not know that the getting of a good advertisement is the chief aim and object of the meetings, and no doubt there are numerous exhibitors at the Drill Hall who care not a rap for an advertisement, but who do very much like to let their fellows see what good things they may have to show them; and that is a form of personal ambition that commands and merits our warmest respect. There is no part of the Royal Horticultural Society's work that commands more respect, not merely on the spot, but in the provinces, than the regular meetings, and the less they become mere trade shows, and the more meetings for the exhibition of all that is best and interesting in horticulture, the greater will it redound to the honour and glory of the society. *A Fellow.*

FIG. 98.—MISLETO OAK IN EASTNOR PARK. (SEE P. 745)
(From a sketch by the Rev. Professor Henslow.)

THE DEAR LITTLE SHAMROCK OF IRELAND.

"THERE'S a dear little plant that grows in our isle,
'Twas St. Patrick himself sure, that set it,
And the sun on his labour with pleasure did smile,
And the dews from his eyes oft did wet it.
It thrives through the bog, through the brake, through the mireland,
And he called it the dear little Shamrock of Ireland,
The sweet little Shamrock, the dear little Shamrock,
The sweet little, dear little, Shamrock of Ireland."

About four years since, as is well known in Cork, I changed my residence, Temple Hill, to new and most virgin soil that had been a sheep pasture for years, now known as Ard-Cairn. The labourers of the village near at hand know what a big job the undertaking was when started—in fact, to make a new place. There were seventy large unwieldly trees, 100 years old, or even more, to be got rid of; there was an immense amount of carting and ground levelling to be done, the filling up of hollows, &c. In doing this the men got down to a bed of brown shingle, and this when taking the pre-Adamite or never before disturbed soil to fill up a particular hollow. This is given by way of preface. The soil having been removed to the depth of 4 or 5 feet, was spread over about a rood of ground that was to all appearance perfectly sterile. The same year, in the autumn, I got it stirred up with digging-forks and pickaxes, and dressed with bone-meal and soot, as a sort of stimulant differing

greatly to what had ever before reached it. The following spring, upon this particular spot, up came a crop of tufts of lovely Shamrock of the most verdant green, and having a 17th-of-March-like appearance—so full of virgin purity, and yet out of such a sterile soil! I lifted a number and planted them out at a distance of 1 foot apart, and we had clumps in 1893 and 1894, 18 inches in diameter from a single plant. From this crop I have succeeded in saving a quantity of seed, and intend to offer it to the Irishmen in America through some trade journal. The seed is bright golden in colour, intermediate in size between that of common Trefoil and White or Dutch Clover.

The problem I want solved is this: Whence came the seed from which the original plants or germs sprang? What was it as "matter" while resting beneath this 4 feet of surface for thousands of years? And how has it kept its character? It is certainly the first lot of Shamrock-seed sowed in quantity on the soil of "ould Ireland." I am planting out 1 acre of young tufts for the seed-crop of 1895, upon the top of my Daffodils, when I expect to harvest a big quantity of seed. I may mention that the natural soil at Ard-Cairn is loam, resting on limestone, and that when making excavations at a lower depth, we have come across a deposit, here and there scatterings of iceberg, drifted or conveyed limestone boulders that with the slightest touch of the sledge-hammer fall to pieces, and when examined they are found to contain fossilised remains of eels, mussels, and cockle-shells in a perfect state. Such limestone boulders are not all of the same degree of hardness, some are much softer than what are found in the adjacent quarry of Beaumont. *W. Baylor Hartland, Ard-Cairn, Cork.*

FLORISTS' FLOWERS.

CARNATIONS.

THESE plants form an important feature now in most gardens, and although they can be grown well in a mixed border of herbaceous plants, it is better to have beds or masses of them planted by themselves, and they will produce a striking effect in the garden, and furnish quantities of cut flowers when in bloom. In poor soils, Carnations will grow and produce flowers about the end of July or early in August only, but in rich deep good loam a succession of blooms is produced until the frost cuts them off. Beds of seedlings, if well managed, produce the greater masses of bloom. Plants now in frames of the florists' varieties require to be looked over, and all decaying or dead leaves removed, the surface of the soil to be stirred at the same time with a pointed stick. Green-fly may be brushed off, but the most effectual method of dealing with the aphis tribe, green or black, either in houses or frames, is to fumigate with tobacco-smoke.

THE AURICULA.

In winter the Auricula is supposed to be in a quiescent condition, and I wish they were in these early days of December, but instead they continue to produce flower-trusses. The Auriculas are like their near allies, the Primroses: when all of them are flowering they are pretty enough, but when flowering so freely in autumn they will not produce such good bloom in the spring. After a wet season like that of 1894, one would have expected cold, foggy weather, but we had such beautiful weather on the first Monday of December that one did not wonder that the thrushes and Primroses thought that spring had come. What are we to do with our precocious plants? Keep them quite dry at the roots, say the old florists. This may do in severe frost, but up till now we have had little. The best we can do is to pull the lights off whenever the weather permits, and keep them tilted night and day, unless there is a dense fog. Remove all dead leaves, and if a spring bloom is the main consideration, pick the pips off also. Do not let the plants get dust-dry at the roots, but let them be well on the dry side before giving them water, and in applying the water do not wet the leaves. *J. Douglas.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

DECEMBER 11.—Present: Dr. M. T. Masters (in the chair); Dr. Bonavia, Mr. McLachlan, Mr. Michael, Rev. W. Wilks, Rev. G. Henslow (Hon. Sec.).

Pines, &c.—Dr. Masters exhibited a series of cones, &c., received from Mr. Herrin, gardener at Dropmore, as follows:—Pinus Lambertiana, the Sugar-Pine, from California, the cones being 12 inches in length, of which the seeds are edible. Abies nobilis, remarkable for the golden-coloured reflexed bracts and the silvery foliage. Araucaria imbricata, first and second year's cones. The largest tree at Dropmore was raised (as also the one lately dead at Kew) from seed brought by Mr. Menzies from Chili. Cupressus Goveniana, remarkable for its elegant branching with decussating branchlets. C. macrocarpa, only growing at Monterey, on the coast of California. It succeeds well on our own coasts, but not inland.

Primula obconica, Cause of Eczema.—Dr. Bonavia described a case of a lady who was three times made seriously ill by handling this plant before it was discovered to be the cause. It appears to be harmless with most people, but is a serious source of trouble to some persons who touch it.

Nepenthes bicalcarata, in Flower.—Dr. Masters showed specimens of the flowers of this plant, which has not been known to blossom in this country before. The inflorescence is an umbel, and not an elongated raceme, as in other species. It was received from the Edinburgh Botanical Gardens.

Tritoma with Axillary Buds.—Dr. Masters showed drawings illustrating the unusual occurrence of flower-buds arising near the base of the stem in this plant. It was observed that other plants are occasionally seen to throw out supernumerary flower-buds, as Docks, Nettles, &c., from stems which usually wither and dry up in autumn.

DEVON AND EXETER HORTICULTURAL.

We learn from the report of the proceedings of this society, which appeared in the *Devon and Exeter Gazette* of December 8, 1894, that a statement was made at the recent annual meeting held at Exeter Guildhall on the 7th inst., under the chairmanship of A. O. Sillifant, Esq., sheriff of the county, which shows an unfavourable position of the finances. The credit balance at the commencement of the year amounted to a sum of £40 9*s.*, and at the finish of the year to £16 7*s.* 9*d.* The committee, in view of the serious state of the finances, urged the members to do all in their power to induce more persons to join the society.

Two exhibitions were held during the year, but at neither was the attendance good. The committee suggested that a Rose show should be held in June or July instead of the August show. It was decided that a Rose and general Show and a Winter Exhibition should be held.

EDINBURGH BOTANICAL SOCIETY.

DECEMBER 13.—The second meeting of the session was held by this Society at 5, St. Andrew Square, on the above date, when a good number of members were present. The programme of communications, contained some interesting items. In the absence of the President, Surgeon-Major H. H. Johnston, occupied the chair. The report for the year 1893 4, showed a very favourable result, considering the additional expenses incurred during the year, and it was unanimously accepted. Mr. R. Stewart Macdougall, B.Sc., was elected a resident Fellow of the Society. Upon the table was an interesting display of plants from the Royal Botanic Garden, illustrating variegation in a large number of orders of plants, which were much admired. Fruits of the remarkable Sebastiana, containing the larvæ of Carpocapsa saltitans from Mexico, were exhibited by Mrs. Sprague.

The newly-elected Fellow, R. Stewart Macdougall, B.Sc., gave, with lantern illustrations, an interesting paper upon Lathyrus sativus, treating of its properties, with a comparative review of some other leguminous fodder-plants, a vote of thanks being heartily accorded the lecturer for his paper. Some well-dried specimens were exhibited of the flora of Ile d'Aigrettes and Les Bénitiers, Mauritius, by Surgeon-Major H. H. Johnston, who also read a report on these islands. Prof. Bayley Balfour, F.R.S., spoke of the importance of recording the flora of these islands, and a vote of thanks was awarded to the reader. The meteorological report from the garden, by Mr. A. D. Richardson, showed a small rainfall during November, as well as an extremely mild average temperature. Notes of a series of experiments of stem-ringing of broad-leaved trees, were read by Mr. Richardson; and Mr. R. Lindsay, Curator, gave a report of vegetation in the garden, very few species being noted as flowering during the last month; Aponogeton distachyon flowered freely in the pond; and Luculia gratissima, L. Pinceana, and Melastoma malabathricum, were exhibited from the glasshouses, by Mr. R. L. Harrow.

HARD-WOODED GREENHOUSE PLANTS.

(*Continued from p. 722.*)

ACACIAS.—The culture of the Acacia resolves itself into two heads, viz., that of plants grown in pots and those planted out in greenhouse or conservatory borders. In either case an excellent return in flower can be had, but the greater quantity, of course, under the latter method. There are varieties which are better suited to pot-culture than others, and of these again there is a considerable diversity of habit. If planted out in lofty conservatories, either as pillar, wall, or roof-plants, the effect when in flower, is really magnificent; the flowers being produced invariably during the early spring when outside flowers are still scarce. There are many gardens where the planting-out system is adopted with excellent results. Syon House and Buxted Park are two instances in private establishments; and at the Royal Gardens, Kew, it is even more extensively adopted in the Australian or temperate-house. When grown in this way, they require to be pruned to keep them within bounds, and this operation should be attended to immediately they are out of flower. An extensive border is not needed or desirable, otherwise the increase in growth would be excessive for all but the largest of houses. The stronger growers, as A. dealbata and A. armata, should have a loamy soil in which to grow, whilst such as A. Riceana and others, need more peat. The last-named is a suitable one for rafters or roofs, whilst A. armata is capital for erect training to pillars or columns, and A. dealbata for covering walls. Of varieties suitable for culture in pots, A. armata, A. Drummondi, A. cordata, A. lineata, A. rotundifolia, and A. verticillata are a select half-dozen, and of these the two first-named are probably the most useful. Less pruning is needed when grown in pots, but keep the plants compact and dwarf, or a deal of time must be spent in tying. If potted thoroughly well in good soil, they will continue in health for two years or even longer, in the case of large plants. Peat and yellow loam, of good fibrous character in both instances, and in nearly equal proportions, will well suit plants of a fairly good size. For small plants it is better to use a greater proportion of peat and sand in both cases. Firm potting is indispensable, for without it the plants eventually become loose around the stem, and impoverished also. These Acacias being amongst the hardiest of greenhouse plants, it is possible, in sheltered and fairly favourable localities, to stand them out-of-doors by the end of May, gradually inuring them to the full sunshine, so that the growth may be completed speedily, and the wood well matured. From thence onwards to the end of September, they will be perfectly safe, and they should then be housed in a light and well-ventilated structure. The potting should be done either when first starting into growth after flowering, or soon after they are housed. During hot weather they will need frequent syringings to prevent red-spider, which, if in any way troublesome, should be destroyed by syringing with sulphur-water. White-scale is another and oftentimes a very troublesome insect-pest to the Acacia, considerable perseverance being required to exterminate it. The best remedy will be a well-proven insecticide at nearly or quite the prescribed strength, used as a dip or for syringing which should be followed by a syringing with water

at about 100° F. In regard to insects, the same remark applies to the planted-out examples. I have not thus far alluded to Acacia lophantha, which is best known, perhaps, as an ornamental plant in sub-tropical gardening, being better raised from seed, the germination of which is exceedingly variable, and needing an extremely moist soil and a brisk heat. This species makes a good decorative pot plant of medium size, and planted out will grow even in lofty houses almost too vigorously. I have seen it in one garden ripen its seeds annually, but if I remember rightly, the plant was in a pot and rooted through into the border, a partial check being thus given. The variety of Acacia, which is so largely imported in a cut state, presumably from the south of France (the Riviera, Nice, &c.), is A. dealbata, or a closely-allied species. It is somewhat surprising how well these long panicles of bloom will last in a fresh condition. I note in an old catalogue, dated 1878, just referred to, that thirty-one varieties or species are enumerated, whilst nearly sixty are given and described in *Dictionary of Gardening*. For all practical purposes, however, I deem those already named to be as good a selection as can be made for garden culture. They are all essentially decorative plants of the first rank, and are well worthy far more attention than they have of late received. *J. Hudson.*

VARIORUM.

Roe Deer and Conifers in Moravia—The winter is not of unusual severity—perhaps 25° below freezing-point, Fahrenheit, with an occasional dip of 10° or 12° below zero, and this lasts for some months without a break. All outside in the garden is frozen hard, and vegetation is asleep, the snow piled up a yard or more high at the sides of the paths. Touch the iron handle of a hothouse door with the bare hand, and the skin at once adheres, and your only chance is to at once let go, with some slight loss of epidermis. The cigar or pipe will not "draw," the moisture has frozen between your lips and the burning end, and it goes out. A look round among the specimens of Thuia, Cupressus, Spruces, and Silvers, reveals the fact that the roe-deer have been in numbers, and severely cropped the points of the shoots to appease their hunger. It is annoying, but what can you do? The fences are banked up with snow, drifted in places like a slanting wall, and this frozen hard enough to carry a man of 10 stone, and here the deer have got over whilst you and your men, with the exception of the hot-water boiler attendants have slept. There are two or three coniferous plants which the roe have not spoiled—Cupressus Nootkaensis and the Yews; the first has a nauseous odour and probably flavour, and instinct tells the deer the latter is dangerous if eaten. Alas! for Cupressus Lawsoniana, it is a great favourite with them, and has suffered accordingly. Red Virginian Cedar (Juniperus virginiana) has immunity from attack by roe-deer when aged, but, like Pinus Strobus, the squirrels delight to nibble the tips, and the snow is covered with them. Thuia sibirica (Warreana) is not much hurt; they do not quite like the flavour, and a nice hedge of it is all right so far. There are only two ways of preventing further mischief, and one is to protect with wire-netting, only the difficulty consists in getting stakes into the iron-bound soil, wherewith to support the netting; the other is to lay on the snow, or, better still, in the forks of the deciduous trees, small bundles of toothsome hay; but beware of touching this with your hands, or as little of it will be eaten as of the Cupressus Nootkaensis. If you have been thoughtful, the Mistleto which grows so abundantly on the Maples by the river will have been cut off with saw and axe, and left under the trees where it fell, a few trees at a time being denuded—not all; you must husband your food stores, for it is perhaps three months still before the snow melts, and the deer need no further help. If the deer have not barked any of your trees, be thankful; the pruning of the tips of branches will cause a more bushy growth than is altogether desirable, and the long sweep of the lower branches is curtailed for a time; but a lesson has been learned that shall bear fruit another winter. *An English Gardener Abroad.*

JUMPING BEANS.

The so-called "Jumping Beans" which have, for the past few weeks occupied a place in the daily press, and which are none other than the "jumping seeds" of some thirty-six years ago, have been carefully described and illustrated in the *Chemist and Druggist* for December 8. The writer of the article in question draws attention to the fact that in 1858, Westwood published an account of the seeds, and described the little creature that causes the motion under the name of Carpocapsa saltitans in the *Transactions of the Entomological Society of London*, and in *Gardeners' Chronicle*, November 12, 1859.

Though the plant which produces the seeds has recently been referred to Sebastiania Palmeri, Müller is stated by the writer in the *Chemist and Druggist* to have ascertained that several species, notably S. Palmeri, S. Pavoniana, and S. Pringlei, have a similar motion arising from the same cause, namely, that of the jumping or springing of the larvæ contained in the seedless carpels. "The jumping Beans are mostly collected near the town of Alamos; their Spanish name is Brincadores. At the time when the fruit begins to form, a moth, the

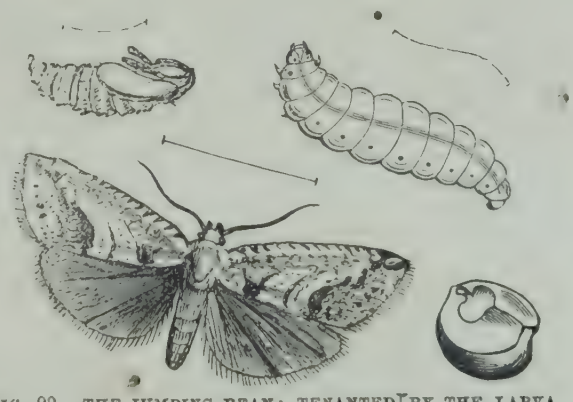

Fig. 99.—The jumping bean: tenanted by the larva of carpocapsa saltitans.

Carpocapsa saltitans, deposits its eggs in the immature whorl. The caterpillar which causes the movement of the fruits is a bright yellow creature, with reddish head, from 8 to 11 millimètres long, and provided with eight pairs of legs. . . . It is closely allied to the Apple-grub of our orchards (Carpocapsa pomonella). Similar dancing grubs have been found in Collugnaya brasiliensis, which was originally believed to be the mother plant of the Jumping Bean; in the fruit of the Tamarisk, which has been found to harbour the larvæ of a small beetle (Nanodes tamaricis), of which the saltatory movements were described in Mathias de Lobel's *Herbal* of 1576; and in certain varieties of Oak-galls, notably those of Quercus macrocarpa and Q. alba."

Our contemporary tells us that the jumping seeds owe their present popularity to an enterprising American firm of advertising experts who have created quite a Bean boom during the past two months. And next, that the movement of the seeds has suggested to a Yankee the invention of a new game. "He divided a circle into segments, numbered the latter, then placing a Bean on the circle, the game commenced, and the betting. It can only be a winter game, for the Beans begin to jump in September and stop in May," at which period the moth emerges from the carpel by a small circular hole which he cuts at one end.

ASHRIDGE.

It would be difficult to say what month in the year the conservatory can be made to look brightest, but I think anyone visiting Ashridge (the seat of Earl Brownlow) would agree that the display at this season would not be easy to surpass (I wish it were possible to produce a similar effect at our autumn Chrysanthemum shows, it would be a relief from the round, formal group we are accustomed to). What strikes one here as a pretty feature is the natural way in which the climbers are allowed to hang over the Palms, Strelitzias, Dracænas, &c.; amongst these are arranged (in groups) Poinsettias, grand plants, with glossy-green foliage down to the pots; alternate with these are groups of well-grown Chrysanthemums (in distinct colours), Orchids, Arums Amaryllis, the latter a very pretty salmon colour (I believe it was introduced by His Lordship from Jamaica some years ago); these with Double Primulas, Roman Hyacinths, and Maidenhair Fern, make a good finish. Mr. Lowe, the head gardener, and his assistants, are to be congratulated upon the natural and artistic effects. It is pleasing to find that the other structures are well stocked. We noticed amongst the Orchids a very choice collection of Cypripediums, C. Chamberlainianum, C. Spicerianum, and C. Harrisianum, holding their own well amongst the others. All the orthodox table and furnishing-plants are well grown here; also a good stock of late Chrysanthemums, which will carry them well into the new year. *J. F.*

NURSERY NOTES.

MESSRS. S. SPOONER & SONS, HOUNSLOW.

A general nursery stock may be seen here, but fruit trees are the specialty of the firm. Plums are grown in numbers, 50,000 of them having been budded this season, the budding being preferred to grafting, as the latter method entails most labour. A loamy soil with a good clay bottom is admirably adapted to their growth, and we noted maiden trees having made a growth of 7, 8, and even 10 feet of well-ripened wood. The collection includes all the best varieties grown for market and other purposes, but the premier place is given to Victoria as the most useful for general purposes. Monarch is also grown in quantity, it is a very large, rather late, and truly good variety, of robust growth, and a free bearer. The fruit does not crack in a wet time, and the tree succeeds as a pyramid, cordon, or standard. An important addition also to late Plums was Grand Duke, which bears freely, and is one of the best for cooking. A very valuable market Plum, early, hardy, and a certain bearer, is Rivers' Early Prolific; it is good for dessert, and when cooked is one of the best flavoured. Another of Messrs. Rivers' introductions—The Czar—a sturdy and upright grower, is as early as New Orleans, and a good and constant cropper; it fruits in clusters, and does not crack. Another great market variety is Gisborne's, somewhat resembling Pershore; it is a stout grower, and an abundant bearer.

Increased attention and space is being paid to the culture of the best Apples and Pears. That excellent Apple, Bismarck, whose worth is fast becoming generally recognised, is a great favourite here; four rows of two and three-year-old trees have produced this season some ten large-sized highly-coloured fruits on each tree. Speaking of highly-coloured fruits, Carlisle Castle is specially noteworthy in this respect; it is of medium size, and may be used either for kitchen or table, and for exhibition. Other high-coloured sorts included Gascoigne's Scarlet, probably the handsomest Apple grown, and worthy of garden culture on account of its agreeable flavour. An excellent and handsome yellow-fruited Apple is Grenadier; it is a regular cropper, and is valuable either for market or villa gardens. Wealthy is a pretty Apple, and of first quality; the flesh is white and tender—an American variety of great excellence. A very prolific market kind, and beautiful under garden culture, is Colonel Vaughan; the fruit is moderate in size, red-flushed and streaked. Lady Sudeley, handsome, and somewhat large for a dessert sort, requires careful handling when picked, as the fruits soon show any little disfigurement like that very handsomely-striped Apple Duchess of

Oldenburgh. Duchess's Favourite is a good market sort; the fruits are somewhat small, but are of a glowing red colour. One of the best Apples known is Early Julien, and the fruits, which are of a primrose colour, may be cooked when quite small. Worcester Pearmain is a great favourite for market. The firm have raised a new kitchen Apple called the Baron. It is a seedling from the well-known Wellington, and has medium-sized fruits; it also keeps as well as Wellington, and is a free bearer. Cox's Orange Pippin has been the shortest cropper this season. Councillor, sometimes known as Yorkshire Beauty and Red Hawthornden, is a handsome yellow, red flushed Apple, and bears fruits on the points of the shoots, requiring, therefore, only partial pruning; it is a good market sort, and is much esteemed as a garden tree on the Paradise. We noticed good quantities of Apples, Gold Medal, Bramley Seedling, Lord Suffield, Stirling Castle, Dr. Harvey, Domino, Hoary Morning, Ecklinville Seedling, Yellow Ingestre, Lord Grosvenor, Warner's King, Keswick Codlin (which seems to succeed in all soils and situations), Peasgood's Nonsuch, Golden Spire, Pott's Seedling, Gravenstein, not a handsome-looking fruit, but of remarkably rich flavour, especially when fresh from the tree; and others.

To refer briefly to Pears—a very useful market sort is Fertility, with medium-sized fruits, and a good bearer. Pitmaston Duchess, and that profitable market sort, Hessle; Duchesse d'Angoulême, Souvenir du Congrès, Conseiller de la Cour, Doyenné du Comice, Williams' Bon Chrétien, the very prolific Gratioli of Jersey, Glout Morceau, Marie Louise, Gansel's Bergamot, Swan's Egg, a very old but good variety, fruits medium-sized, Beurré Diel, B. Giffard, B. d'Amanlis, B. Capiaumont, and Louise of Jersey, were noticed, and many others. A good stock of Cherries, standard, pyramid, and dwarf-trained, may be seen; and of Peaches and Nectarines in leading varieties. Roses are present in large quantity, including the best varieties. *J. B.*

TRADE NOTICE.

A FIRE broke out on Wednesday night, the 19th inst., at Mr. W. Duncan Tucker's Horticultural Building Works at Tottenham. The timber stacks on the west side of Lawrence Road were destroyed, but those on the east side were untouched. The fire will not, therefore, interfere with the conduct of the business in any way.

MARKETS.

COVENT GARDEN, December 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

There has been, during the week, a general run on first-class Potatos at an advance of 5*s.* to 7*s.* 6*d.* per ton. The best samples off Dark soils have also commanded quick sales and better prices than last week. *J. B. Thomas.*

SEEDS.

LONDON: *December* 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market exhibited an idle holiday character. Trefoil, Alsyke, and Red keep steady. White Clover seed, on the other hand, is exceptionally depressed. There is nothing doing in Rye-grasses. The new Kœnigsberg Tares just arrived prove acceptable, both in quality and price. For White and Scarlet Runners full prices are asked. The Canary-seed market shows great strength. Hemp seed offers on tempting terms. In neither Mustard nor Rape seed is there any change. Linseed is slightly easier.

FRUITS AND VEGETABLES.

BOROUGH: *December* 18.—Quotations:—Cabbages, 2*s.* to 2*s.* 6*d.*; Savoys, 2*s.* 6*d.* per tally; Brussels Sprouts, 9*d.* to 1*s.* 6*d.* per half sieve; Cauliflowers, 1*s.* 6*d.* to 2*s.* per dozen; Greens, 1*s.* to 1*s.* 6*d.*; Turnips, 1*s.* 6*d.* to 2*s.*; Carrots, 1*s.* 9*d.* to 2*s.*; Parsley, 1*s.* 6*d.* per dozen bunches; Parsnips, 2*s.* to 2*s.* 6*d.* per bag; Horseradish, 1*s.* 1*d.* to 1*s.* 3*d.* per bundle; Celery, 4*s.* to 8*s.* per dozen bundles; Onions, English, 2*s.* to 3*s.* 9*d.* per cwt.; do., foreign do., 1*s.* 9*d.* to 2*s.* 3*d.* per bag; Apples, 3*s.* to 9*s.* per bushel; do., Canadian, 12*s.* to 18*s.* per barrel; other sorts, 8*s.* to 10*s.* do.; Pears, 2*s.* to 4*s.* 6*d.* per bushel, and 2*s.* to 4*s.* per case.

STRATFORD: *December* 18.—The supply to this market during the past week has been excellent, and with a large attendance of buyers, a brisk trade was done at the undermentioned prices:—Cabbages, 1*s.* to 2*s.* per tally; Savoys, 1*s.* 6*d.* to 3*s.* per tally; Cauliflowers, 1*s.* to 2*s.* per dozen; do., 5*s.* to 8*s.* per tally; Celery, 6*d.* to 9*d.* per roll; Horseradish, 1*s.* to 1*s.* 3*d.* per bundle; Brussels Sprouts, 6*d.* to 1*s.* per half-sieve; Holly, 6*d.* to 2*s.* per bundle; Miselto, 8*s.* to 10*s.* per crate; Evergreen, 6*d.* to 10*d.* per bundle; Turnips, 1*s.* 9*d.* to 2*s.* 3*d.* per dozen bunches; do., 30*s.* to 40*s.* per ton; Carrots, household, 22*s.* 6*d.* to 30*s.* do.; do., cattle-feeding, 20*s.* to 25*s.* do.; Parsnips, 6*d.* to 10*d.* per score; Mangels, 14*s.* to 18*s.* per ton; Swedes, 12*s.* to 18*s.* do.; Onions, English, 55*s.* to 70*s.* do.; do., Dutch, 1*s.* 9*d.* to 2*s.* 3*d.* per bag; Apples, English, 2*s.* to 6*s.* per bushel do., American, 14*s.* to 20*s.* per barrel; do., Belgian, 9*s.* 6*d.* to 10*s.* 6*d.* per case.

FARRINGDON: *December* 20.—Quotations:—Sprouts, 1*s.* 6*d.* per bushel; Parsnips, 40*s.* per ton; Beetroot, 1*s.* 6*d.* per bushel; Carrots, 25*s.* to 35*s.* per ton; Turnips, 30*s.* to 40*s.* do.; Onions, English, 70*s.* do.; Chestnuts, 15*s.* per bag Pine-apples, 3*s.* 6*d* to 4*s.* 6*d.* each; Tomatos, 4*s.* 6*d.* per box; Pears 8*s.* to 10*s.* per case; Apples, Canadian, 11*s.* to 15*s.* per barrel; Grapes, English, 9*d.* to 1*s.* 3*d.* per lb.

POTATOS.

BOROUGH: *December* 18.—Prices ranged from 60*s.* to 110*s.* per ton.

STRATFORD: *December* 18.—Quotations:—Magnums, dark-soil, 60*s.* to 65*s.*; do., light-soil, 62*s.* to 70*s.*; Bruce, 65*s.* to 80*s.*; Imperators, 65*s.* to 80*s.*; Main Crop Kidneys, 70*s.* to 85*s.*; Beauty of Hebron, 70*s.* to 80*s.*; Scotch Magnums, 65*s.* to 75*s.*; do., Bruce, 65*s.* to 75*s.*; Scotch Main Crop Kidneys, 80*s.* to 90*s.* per ton.

FARRINGDON: *December* 20.—Quotations:—Maincrop, 90*s.* to 100*s.*; Sutton's Abundance, 80*s.* to 90*s.*; Bruces, 70*s.* to 80*s.*; Magnums, 65*s.* to 70*s.*; Imperators, 75*s.* to 80*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 120*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 6 *s.* to 105*s.*; do., inferior, 36*s.* to 80*s.*; mixture, 98*s.* to 105*s.*; and straw, 23*s.* to 36*s.* per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending December 15, and for the corresponding period last year:—1894: Wheat, 20*s.* 10*d.*; Barley, 21*s.* 5*d.*; Oats, 14*s.* 3*d.* 1893: Wheat, 26*s.* 9*d.*; Barley, 28*s.* 10*d.*; Oats, 18*s.* 3*d.*

CATTLE.

CHRISTMAS MARKET.—On Monday last there was a splendid show of beasts and sheep on offer, the beasts showing a grand array of the usual breeds—Scotch, Devons, Herefords, Welsh, and mixed breeds. Early maturity was a prominent feature; but the demand was slack, and prices not encouraging—in many instances £3 to £4 per beast being taken to encourage business. There were grand pens of Downs and other favourite classes of sheep, all fetching good prices—some, we believe, in excess of former years. Prices were helped by reason of the shorter supply than put up last Christmas all round; breeders and feeders well deserved the high meed of praise awarded to them; and, although beasts suffered in price, it must be borne in remembrance that the cost of feed during the past year was much less than in 1893.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (−) the Mean for the week ending December 15.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1894.	Below 42°, difference from Mean since January 1, 1894.	Rainfall. More (+) or less (−) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1894.	Total Fall since Jan. 1, 1894.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1894.
		Day-deg.	Day-deg.	Day-deg.	Day-deg.	10ths Inch.		Ins.

*	4 +	51	0	+ 325	— 26	1 +	210	37·4	16	42

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N. 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 15, is furnished from the Meteorological Office:—

"The *weather* during this period was mild and very unsettled over the Kingdom as a whole. Rain fell almost daily in the western and northern districts, and some rather heavy falls were experienced in the south and south-east towards the end of the period.

"The *temperature* was much above the mean, the excess ranging from 4° in the 'Channel Islands,' to 6° in nearly all other districts, and to 7° in 'Scotland, W.,' and 'England, N.W.' The highest of the maxima were recorded during the middle or latter part of the week, when they ranged from 62° in 'England, S.W.,' and 60° in 'Scotland, W.,' to 54° in the 'Midland Counties,' and to 53° in 'England, E.' The lowest of the minima were registered on the 9th, and varied from 23° in 'Scotland, E,' and 26° in the 'Midland Counties,' and 'England, S.,' to 30° in 'England, N.W.,' and 'Ireland, S.,' and to 35° in the 'Channel Islands.'

"The *rainfall* just equalled the mean in 'Scotland, E.' and 'England, N.E.,' but exceeded it elsewhere, the excess in most cases being considerable, and especially in 'Scotland, N.'

"The *bright sunshine* shows a deficit in all districts. The percentage of the possible duration ranged from 16 in 'England, S. and S.W.,' and in the 'Channel Islands,' and from 13 in 'Ireland, S.,' to 6 in 'Scotland, N.,' 'England, N.W.' and 'Ireland, N.'"

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

PINUS AYACAHUITE.—We have received the following communication from W. T. Thiselton-Dyer, Esq., C.M.G., &c., director of the Botanic Gardens, Kew: "We are badly off for this interesting species at Kew. I am anxious to get young plants for our Pinetum, but am unable to find any but grafted ones in the trade. It is possible that some nurseryman may have seedlings to dispose of, in which case I should be obliged if he would communicate with me."

LAWN-SWEEPER AND COLLECTOR.—A correspondent, "E. W. P.," would be greatly obliged by some of our readers kindly informing him where a machine capable of sweeping and collecting may be obtained.

GRAFTING.—M. LUCIEN DANIEL (*Revue Générale de Botanique*, 6, 1894) has been making a thorough study of herbaceous grafting. He has not only studied the subject from the morphological and physiological point of view, but now suggests a series of principles for the practical application of herbaceous grafting. He finds it possible to vary the flavour of legumes by grafting on a plant having a different flavour; to retard the flowering of Crucifers (and so to avoid hybridisation by insects, &c., when it is desired to keep varieties pure); and to create new varieties by grafting after seed formation. He has not been able to graft etiolated herbaceous plants. *Botanical Gazette.*

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

ANALYSES OF EDIBLE ROOTS AND OF VEGETABLES: *A. L.* The *Handbook to the Food Collection*, Bethnal Green Museum, will afford some information, but a thorough knowledge of this subject would require several years' practice in a laboratory. There are few accessible books treating of these analyses.

FREESIAS: *Constant Reader.* If the bulbs were of flowering age they may fail to flower from being prematurely ripened, or from too early application of water after potting them. We cannot say with certainty. Under the right treatment, pursued from now onwards, the bulbs should flower another year.

MOULD ON CHRYSANTHEMUM LEAVES: *W. Stanbury.* The white mould, Oidium chrysanthemi, see *Gardeners' Chronicle*, November 29, 1884, fig. 118. The grey mould not found, but from the description it may be a Penicillium, and not a parasite; hence, not injurious, but developed upon dead spots. *M. C. C.*

NAMES OF PLANTS: *F. G. Walton.* 1, Rhipsalis salicornioides; 2, Mammillaria; 3, Haworthia cymbiformis; 4, Cereus; 5, Haworthia radula; 6, Gasteria disticha. *W. W.*—*A. J. A. B.* Your specimens are both forms of Acokanthera spectabilis.—*J. C. S.* 1, no fungus present; 2, Peziza (Lachnella) nivea; 3, missing; 4, Stereum hirsutum, Fr.; 4, again, Marasmius androsaceus, Fr.; 5, Tremella frondosa, or sarcoides—no fruit; 6, grumous matter, nothing to be made out of it. Perhaps one of No. 4 should be No. 3. *M. C. Cooke.*—*J. C. S.* 1. Peziza repanda, Fr.; 2, Hypoxylon multiforme, Fr.; 3, Corticium Lycii, P.; 4, not a yellow Peziza, as stated, but an immature Hymenochœte; 5, Diatrype disciformis, Fr. *M. C. Cooke.*—*J. Monro.* 1, Urceolina pendula; 2. Pteris serrulata; 3, Pteris serrulata cristata; 4, Phrynium variegatum (Maranta); 5, Pteris longifolia; 6, Pteris Bausei.—*T. S.* 1, Aspidium falcatum (Cyrtomium); 2, Leycesteria formosa; 3, Anthericum variegatum.—*H. T.* Cypripedium insigne, Dendrobium nobile. The cross you mention is little removed from C. Harrisianum.—*Cooper.* 2, Elæagnus pungens.—*Ignoramus.* We cannot undertake to name plants from their leaves only. Is it a climber, or what? you give no information, and send a wretched scrap, which may be an Asparagus.—*J. H. B.* Crotons: 1, variegatus; 2, angustifolius; 3, Queen Victoria; 4, Hammondii; 5, Countess; 6, Macarthuri.—*W. T., Hea Moor.* Ilex latifolia.

PLAN OF PUBLIC PARK: *R. T. H. P.* The figure which you enquire about was a photograph of the drawing of the plan, greatly reduced. If you will kindly send your plan, we will consider its suitability for reproduction.

VIOLET LEAVES BROWNED AND DISFIGURED AT THE EDGES: *A. B. C.* Probably the effect of saltblast. We do not find either insects or fungi.

WASTE FISH FROM A SHOP AND ROAD-SCRAPINGS: *Constant Reader.* Rather than dig this in among the Roses just as it comes from the shop, when it might do harm to the roots, it would be better practice to let it decay, and then make use of it. Mix the refuse fish with soil, make a heap of it when mixed, and cover with 6 inches of soil, so as to keep in the ammonia as much as possible. The road-scrapings will do good if the soil is a poor clay, in making it more pervious to moisture; but they should be incorporated intimately with the staple to a depth of 2 feet; merely digging them amongst the Roses without trenching the land will not benefit the plants much. This might be done now, the Roses being laid-in till February, and lightly protected during hard frosts with Fern or straw. Do not place the 8-inch layer of leaves on the Rose beds; it would do more harm than good.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

Has a knowledge of Office and Seed-shop Work. Excellent testimonials. — J. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SALESMAN, BUYER, or GROWER, etc.— Age 30; good all-round experience. Twelve years excellent references.—F. W. MACER, 5, Berwick Street, Pimlico, London, S.W.

THE END OF THE CENTURY draws near, and somehow the fact impresses one and makes one think. On the threshold, as it were, of the twentieth century, we pause and take a glance back over the years that are gone. How much has happened during the now dying century! What wonders have been given to the world! The power and use of steam, the electric telegraph—these and many others are the discoveries of the nineteenth century. But that which will cause the closing century to stand out above all that have gone before and all that are to come, is the fact that in its earlier half was discovered a priceless blessing to mankind—those universal remedies—HOLLOWAY'S PILLS and OINTMENT.

PRIMULA OBCONICA GRANDIFORA,

ONE OF THE BEST NOVELTIES FOR THE COMING SEASON.

Individual flowers much larger than those of the normal type, measuring from 1 to 1¼ inch in diameter; they are also deeper in colour, and of greater substance. Seed 2s. 6d. per packet.

PRIMULA SINENSIS FIMBRIATA, BRILLIANT.—Beautifully-fringed flowers, of the most brilliant and richest shade of crimson-magenta, tinged with carmine; lemon-yellow eye. 2s. 6d. per packet.

PRIMULA SINENSIS FIMBRIATA, COMET.—Rich carmine-crimson, shaded with magenta; throat yellow, surrounded with dark maroon zone. 2s. 6d. pkt.

Among the numerous varieties of Chinese Primroses, the two described above are immeasurably the best high-coloured varieties; and one of the best Whites is "MONT BLANC," also 2s. 6d. per packet.

WILLIAM BULL, F.L.S., Establishment for New and Rare Plants and Seeds, 536, King's Road, Chelsea, London, S.W.

Williams'

STERLING NOVELTIES for 1895,

Our own introductions, now offered for first time.

PRIMULA SINENSIS FIMBRIATA

"SNOWBALL," New. The New Giant Strain.

Without exception, the finest White Primula in cultivation. It is more vigorous in growth than the old varieties, the foliage being remarkably strong. The flower stem is very sturdy, rises well above the foliage, and bears a profusion of massive flowers of a pure white colour of great substance. The individual blooms measure 2½ inches in diameter, and are exquisitely fringed. *Per Packet*, 5*s*.

TOMATO, WARDEN PARK FAVOURITE

(New), is a fine variety for winter work; grown in pots it will fruit when scarcely 6 inches high. Fruit of medium size, ribbed, and bright red colour. Very free setter, and a good bearer. *Per Packet*, 1*s*. 6*d*.

B. S. WILLIAMS & SON, Victoria and Paradise Nurseries,
UPPER HOLLOWAY, LONDON, N.

CHRYSANTHEMUMS.

NOVELTIES

are very numerous, but I prefer to offer ONE really meritorious to a dozen second-raters. Out of a large batch of seedlings I find many which are equal to several Novelties offered this season, but the one which excels ALL others is

MRS. W. J. GODFREY.

Undoubtedly the Best Novelty of the year, and the most beautiful variety in existence. A massive and monster MRS. ALPHEUS HARDY, combined with good sturdy habit and easy culture.

Miss RITA SCHROETER

(C. E. SHEA).

This is the only English Seedling of the year certificated at the principal Exhibition of the National Chrysanthemum Society, held in November last.

THE MOST RELIABLE CATALOGUE published will be sent free to all applicants.

W. J. GODFREY, EXMOUTH, DEVON.

TEA ROSES
IN POTS.

STRONG PLANTS
In Great Variety.
Splendid Quality.
ALSO
STRONG CLIMBING ROSES.
All of the Best.

FULLEST PARTICULARS ON APPLICATION.

Also H.P. & all other Roses from the open ground.

DICKSONS, CHESTER.

RHODODENDRONS ON THEIR OWN ROOTS

The finest named hardy kinds can now be supplied. These are much to be preferred to grafted plants, which are in many instances most unsatisfactory to the purchaser.

ANTHONY WATERER,

VEITCHS'
CHOICE
FLOWER SEEDS

POST-FREE.

PHYSALIS FRANCHETI (NEW)

Award of Merit, R.H.S., October 9, 1894.

A novelty of sterling merit, very striking in appearance, producing bright red fruits 3 inches in length, and from 7 to 8 inches in circumference. Per Packet, 2s. 6d.

CAMPANULA PYRAMIDALIS COMPACTA (NEW).

(Syon House Variety).

This variety is quite distinct from the older form, being of dwarfer pyramidal habit, with larger flowers, and a deeper blue; very sturdy and free-flowering.
Per Packet, 1s. 6d.

DATURA-CORNUCOPIA (NEW).

Flowers of immense size, beautifully marbled and strongly scented. Per Packet, 1s. 6d.

SEED CATALOGUE for 1895 *has now been posted to all Customers; if not received kindly notify and another copy will be sent.*

THE
Gardeners' Chronicle.

SATURDAY, DECEMBER 29, 1894.

THE DAFFODIL "SIR WATKIN."

THE giant Daffodil Sir Watkin came upon us all as a surprise in 1884—just ten years ago. Its history has always been veiled in obscurity, and although Mr. Pickstone gave an interesting account of its discovery at the time, it was always supposed that there was some secret which he had not revealed. Whenever he was pressed for further information, he used to say that some day he would tell all he knew about it. He has now very kindly furnished me with an autobiographical sketch of his early life, in so far as it led up to the discovery of the Sir Watkin Daffodil, so we have now the full explanation from his own pen. I give the narrative in his own words.

"I was born at Whitefield in 1823. John Horsfield, son of William, was one of my playfellows, and I was often privileged to go into Horsefield's garden in Warren Lane, Besses o' th' Barn. I knew John Horsefield very well. William and I went to the same dame-school at Besses o' th Barn. Most of the cottages at that time were occupied by handloom-weavers. It was the common occupation of the poor in the district, and, commencing to work at seven years of age, which was then usual with working people's children, I too became a handloom-weaver. In 1840, however, I got work in a Manchester warehouse, and served an apprenticeship to the business. My father had been manager for many years for a local manufacturer at Whitefield, who gave up business in 1843. I was then twenty years of age; my wages were 12*s*. 6*d*. a week. My father was very distressed at losing his situation, and especially depressed that with his well-known ability in the manufacture of coloured goods, none of the local firms sent for him to work for them. His wages in so important a job had never exceeded 27*s*. a week, and a present of £5 at Christmas. Although only a youth I wrote him a letter, advising him to begin manufacturing for himself. He had saved very little out of his small wages, and did not see how it could be managed. I told him it would come from somewhere, and so it did. Starting in a part of the cottage in which we lived, success was soon assured. The concern grew by leaps and bounds. Hard work with great economy made itself felt, and at the end of two years we had saved £1250, and repaid all the borrowed money with interest." [We need not follow Mr. Pickstone's commercial history further. He prospered in business, and in 1866 made arrangements by which he ceased to be an active partner.]

"It was during the period of comparative inactivity, from 1866 to 1872, that mining proclivities took me into Wales. I hired a cottage in a remote and very picturesque part of Merionethshire, in near

proximity to Arran Mowddy, one of the higher mountains, and immed ately beneath Crowach Crag, which rises nearly 1000 feet perpendicularly. It was under the shadow of this great rock, on a tributary of the River Dovey that I met with the great Welsh Daffodil, now known to florists all the world over as Sir Watkin. Some of my bulbs came from the garden of a ruined cottage connected with a mine that had been given up. This mine was on land that had belonged to the Wynns of Wynnstay, thus connecting its early history with Sir Watkin's family. I nourished this foundling Daffodil for years, but simply as a Daffodil. When I removed to Hampstead near London, I took the bulbs with me. It was a very fine, pretty, sweet-smelling Narcissus, and that was all it was to me. It might have been in all the florists collections, for anything I knew. In 1873 I bought a place in the corner of Denbighshire near to Caerwys. I took my Daffodils with me from London, and planted them in the garden and woods at Maesmynam Hall, and there they grew, those that found themselves in suitable situations grew famously, those in bad ground fell back.

"About the year 1880 there chanced to come that way, looking out for something he could pick up, one of the well-known caterers for Shudehill Market, Manchester. The Hall being within sight of the railway from Chester to Denbigh, this man seeing the profusion of flowers, left the train at Bodfern, and walked to Maesmynam. I happened to be away from home that day. On my return, my boys told me that a man had been, and wanted to buy all my Daffodil flowers, and he would call again. I told them they might sell them, and divide the money. They sold them for £2. Thousands of them were soon after taken away, and were sold both in Liverpool and Manchester. The man refused even to be bribed to say where he got them from.

"The following year, on one of my visits to Whitefield, I put into my coat one of my very fine Daffodil flowers. On leaving the station at Whitefield I met one of the sons of Horsefield, who was a postman there. He was attracted by my Daffodil, and stopped me to see what it was. It was a stranger to him, he said, and it was very nice indeed. I thought as it was a strange flower to a son of the raiser of the Horsefield Daffodil, I had best try what the best florists knew about it. I therefore sent out boxes of blooms to several experts, amongst them to Joseph Allen of Whitefield, referred to in Mr. Brockbank's article on John Horsefield in the *Gardeners' Chronicle*, October 20. A box went to Peter Barr of Covent Garden, and to each of the Dicksons of Chester. I also took blooms with me on my visits to Manchester, and sold them to the florists. It happened that some of the blooms thus sent out found their way to the Daffodil Conference of 1884, and as the flower proved to be an unnamed child, a stranger amongst the great florists, it was there and then baptised 'James Dickson.'

"At this juncture several amateurs and some business florists turned up at Maesmynam to find out something about this new wonder. James Dickson & Sons were the first to call. They made overtures to buy my bulbs. I sold them 1000, and agreed to give them the first offer of what I had. They, of course wanted to know all about its birthplace and pedigree, as did afterwards Peter Barr and others. Among my numerous visitors (April 12, 1884) came Mr. Brockbank, of Manchester, who had written to me previously, and now came by invitation specially to see my Daffodil. After a good look at my blooms, to his great delight, he said to me, "Do you know, Mr. Pickstone, that your Daffodil has been before the Daffodil Conference in London (April 1), and is now on the register of the Horticultural Society as the 'James Dickson?'" I said, of course, that I knew nothing of it. He suggested that they might have called it the 'William Pickstone,' and that at any rate I ought to have the naming of it. I said that mine was too obscure a name for so beautiful and so sweet a flower. He then suggested that it should be called 'Sir Watkin;' and as Sir Watkin Williams Wynn is the uncrowned King of Wales, and had farms near the place of its birth, I readily accepted the suggestion, and at once communicated with Lady Wynne. Sir Watkin was at that time lying ill in London, I therefore waited that afternoon on Mrs. Williams of Cefn, to whom I took a box of the flowers. They were sent to London the same evening, and in two days I had the consent of Sir Watkin and Lady Wynn, who with great willingness became sponsors to the unnamed Welsh baby. James Dickson & Sons bought my bulbs at my own price, a condition of sale being that it was to be introduced to the bulb-buying world as Sir Watkin. I gave Mr. Brockbank on the spot a bagful of the bulbs. Naturally I held all information for years from all inquirers, but I promised Mr. Brockbank that I would some day tell him something of its history, so far as I knew it; and now, at his request, I willingly hand these particulars to that gentleman. Of one thing I am certain, that Mr. Brockbank showed me, years ago, in a big old folio (Hale's *Eden*) of his, a print of this same Daffodil, but not by any means so large as those I was able to show him growing at Maesmynam Hall when he visited me there."

To those familiar with the literature of the subject it will be seen that there is nothing really new in the above narration. The history of the Daffodil had already been arrived at. The first article from my pen appeared in the *Gardeners' Chronicle*, April 26, 1884, and in it was figured a likeness of the James Dickson Daffodil, sent by the Rev. C. Wolley Dod, and which is now here reproduced (fig. 100).

In the *Garden*, October 25, 1884, there was published an article of mine on Sir Watkin, tracing it back to Hale's *Eden* of 1737, where there is a full-sized drawing given, which is also here reproduced for comparison with Mr. Wolley Dod's drawing (fig. 101).

There can, I think, be no doubt as to the identity of the two flowers.

In Hale's *Eden*, p. 484, A.D. 1756, and also in Hill's *Garden of Eden*, 1773, same page, is the engraving of the Nonpareil Daffodil, with the following description:—

The Nonpareil Daffodil.

"We have described to the gardener many valuable Daffodils, but there yet remain two or three others, which by proper management are capable of being kept to this late season; and thence acquire a new value. The present species is one. It was early distinguished by the writers on plants; and obtained, from its great size and fine colouring, very honourable names, the Incomparable, the Nonpareil, and the Excellent Daffodil.

The Latin authors have called it Narcissus maximus, and Omnium maximus, the greatest Daffodil; and C. Bauhine, Narcissus latifolius pallidus calyce amplo: broad-leaved pale Daffodil, with a great cup.

Linnæus, who has reduced under a very few heads the several Daffodils, allows this elegant flower no more than the distinction of a variety; he refers it to the common or bastard Daffodil, which he names Narcissus spatha uniflora, Nectarii limbo rotato, campanulato erecto, patulo equale: one-flowered Daffodil, with the verge of the Nectarium rotated and bell-shaped, erect, open, and equal."

This accounts for the name "Incomparabilis," which is now used for the whole tribe of chalice or star-flowered Narcissi. It would seem as if they had degenerated from the great original, which obtained its name from its great size.

This Daffodil can, however, be traced still further back, and to a source from which Dr. Hill got his original, although he used a new illustration of life-size.

In Gerarde's *Herbal*, 1636, p. 135 (1), the Nonpareil Daffodil is figured, also called N. omnium maximus:—(1) "The first of these, which for largenesse is called Nonpareille, hath long, broad leaves and roots like the other Daffodils. The floure consists of six very large leaves, of a pale yellow colour, with a very large cup, but not very long. This cup is yellower than the encompassing leaves, narrower also at the bottom than at the top, and unevenly cut about the edges. This is called N. omnium maximus, or Nonpareille; the figure well expresseth the floure but that it is somewhat too little."

Mr. Pickstone told us originally that when he first became acquainted with this Daffodil in the valley of the Dovey it was to be seen in many of the old gardens, only he thought his a finer form than occurred generally thereabouts. He found it growing in large clumps, in the cottage gardens where he became acquainted with it, and it grew also in the Plas Gardens (Sir E. Buckley's), and in many of the old farmhouse gardens, and was finest when found growing on the mountain gravelly soil. He always understood that it had grown in that valley for 100 years before he saw it, and it grows there now, although the bulb dealers have very nearly exterminated it, as they did the Tenby Daffodil when it became famous some years ago. "Sir Watkin" is therefore, the old original "Incomparabilis." Strange indeed that it should have been altogether forgotten and overlooked for 250 years at least, although its portrait was in the old herbals, and its name continued in gardeners' books; and stranger still, that Dicksons should have become the purchasers of this novelty when all the time it abounded within a few miles of their Newtown nurseries, quite unknown to them, and where it had flourished for at least 100 years. *W. Brockbank, Brockhurst, Didsbury.*

Orchid Notes and Gleanings.

CYPRIPEDIUM × LEEANUM GIGANTEUM.

Cypripedium × Leeanum has always been a favourite, and there is great variety in the different forms of it which have been raised independently in gardens. The largest variety which has yet appeared is C. × Leeanum giganteum sent out by Messrs. Heath & Son of Cheltenham, and which, when well grown, it seems impossible to excel by intercrossing C. Spicerianum, and any of the forms of C. insigne, at present known. It is at present in flower in the collection of H. T. Pitt, Esq., Rosslyn, Stamford Hill, the flowers being the largest and finest we have as yet observed. The Cypripediums are remarkably well grown at Rosslyn, which accounts for the unusual beauty of their flowers, for Mr. Pitt says he never yet has purchased one in flower which he could not show in better form after he had had it a year or so.

Oncidium tigrinum.

This plant, one of the showiest and most useful of Orchids for the cool-house, will be found in bloom at the present time, its fine sprays of yellow-lipped fragrant flowers being observed in most collections. The best flowers we have seen this year come from the gardens of R. Brooman White, Esq., Arddarroch, Dumbartonshire. Mr. Roberts, the gardener at that place, remarks in the note accompanying the flowers, that a fine show of Oncidium tigrinum can be seen there, and one of the specimens in bloom is the best he has ever seen, as would be remarked in the blooms sent, which measured fully 2 inches across the lip. There are thirty-two flowers on the spike, and these lasting a very long time in perfection, render the species of much value at this season. Moreover, the plant takes up but a small amount of space. *J. O'B.*

M. Peeter's Orchids.

At Brussels we visited lately a large house entirely devoted to hundreds of Cattleya labiata in bloom. Among the specimens we noted two very distinct varieties—C. labiata Peetersi, Rolfe, and an unnamed variety. The former was noticeable for the unusually dark colouring of the whole of the flower, the tint was a beautiful purplish-red, the mid-rib broad and rosy-white, which makes it exceedingly effective; the lip is broad, still darker purple than the petals, which are velvety, very firm in texture, so that the flower appears as though cut out of velvet. The other variety is certainly an unusual one, and quite unique. All the divisions of the flowers are lilacy-rose, much streaked with purplish-rose, after the fashion of certain varieties of Azaleas,

notably A. indica Antigone. The appearance of the flowers is most attractive and unlike that of any other known form. *Ch. D. B.*

Catasetum imperiale.

We recently admired this fine new Catasetum at

Fig. 100.—sir watkin daffodil: perianth canary-yellow; gamboge-orange cup. (see p. 774)

L'Horticulture Internationale (M. Linden), and it is far superior to all other members of this genus as at present known. The raceme, sturdy and wavy, bears twelve flowers and buds, remarkably large and of unusual colouring. The two upper petals are cream-white, like mother-of-pearl, with dots and spots of madder-colour, mixed with purple. The lip, broadly spreading, is unequalled in any other species; it is all dark madder, tinged with purple, save at the edges, where there is a narrow bordering of pure white, which widens considerably at the base; in the centre of the lip a funnel-shaped depression comes after a white space, and is surrounded by numerous unusually dark papillæ; all this portion is bounded by two bands, wherein purple predominates. The sepals are pure white, the column also white, bears a long slender horn, and the base is dotted with madder mixed with purple. *Ch. D. B.*

Orchids, &c., in New South Wales.

Enclosed you will find photos (two) of Dendrobium Bensoniæ, Cactus, and interior of cool-house; or, as we term it here, "bush-house." The Dendrobium Bensoniæ is sent at the suggestion of my gardener, who says that he never saw as fine a plant in England. The flowering-growths are those it made with me during the past season. It had altogether about 140 flowers, mostly in triplets. This plant took the 1st prize for single Orchids at our recent Horticultural Exhibition. The other Orchids to be seen on the same plate are Cattleya Mossiæ, Cymbidium albuciflorum and Cypripedium barbatum and caudatum. The tails of the latter are 27 inches in length. The small one, in the left-hand lower corner, is D. D'Albertisii.

The Melon-Cactus had twenty-flowers on it when the photograph was taken last season. It is in flower again just now, with about thirty flowers, and a considerable number of buds to break.

The interior of bush-house is somewhat unique. Originally, it was covered with brushwood for Fern-growing; I have since, however, covered it with glass, as I found this was necessary for growing cool Orchids. The southern side (which is the same as the northern side with you, and from which most of our cold winds come) is a brick wall, rusticated with lumps of what are known as "terra-cotta lumber," against which there is a sloping bank of about 2 feet in height at the back, and 6 inches in front, bordered also by lumps of the terra-cotta lumber. In this bank are planted various cool Ferns, Begonias and ornamental plants; on the lower pieces of terra-cotta lumber on the wall, dwarf-growing Ferns; and on the upper pieces, Orchids, chiefly of Australian varieties, and which promise to do well. I should have said that the other part of the house, as will be seen from the photo, is lattice-work, which, owing to its being rather open, is covered with Willesden scrim.

I am not aware that terra-cotta lumber has been used for Orchid growing in your part of the world; if not, I strongly commend it to the attention of Orchid growers for drainage purposes, more particularly in pans and baskets, but also on the lumps by itself. I may describe it as being a clay pumice. It holds a large quantity of water in the pores in a nice, sweet condition, much in the same way as charcoal does. As doubtless you are aware, it is made by mixing unctuous clay with about an equal proportion of sawdust or vegetable fibre, which in the burning leaves its ash and the material very porous. I use it almost entirely in the place of broken crocks for drainage. The roots of Orchids that do not require much sustenance just seem to revel in it.

[The material which is called "ballast" in most parts of England is in use in some gardens here for the purpose indicated. Its great weight when moist is the chief objection.—Ed.]

Just now I have in flower a Dendrobium of the undulatum group, from the Solomon Islands, the stem and leaf of which are almost indistinguishable from the type, but the flower is very distinct. The sepals (twisted) are very much like D. Johannis, but of a dark chocolate brown. The throat and labellum, of a cream white, are very much marked with dark lines of the same colour as the sepals. Four plates on the lip are very much raised, flower about the same size as D. Johannis, of the same group. It is now in the hands of one of our own esteemed local botanists (Mr. Baker, of the Technological Museum) for description.

We are at a considerable disadvantage here for want of works of reference, as we can find very little affording us any information with regard to the flora of the Solomon Islands. [There is not much to be had beyond Dr. Guppy's book.] I have several other Orchids from this part of the world, which have not flowered with me yet, amongst others, a Phalænopsis. I have also about fifteen to twenty different varieties

of Orchids from New Guinea. The pieces, unfortunately, are generally very small. One in particular, which I am almost afraid I will lose, is very distinct as an Orchid. The collection from which I received most of them was almost entirely destroyed by sea-water. This latter plant has a stem something like a very thin Vanda, not so thick as a pencil, about 12 inches long, the leaves, like short Vanda leaves, about 2 inches or 3 inches long, but thin. There was also another plant, of the Vanda or Saccolabium order.

I noticed a description recently in your paper of D. Macgregori, and suspect that I have this one amongst the collection. An Orchid that has been quite a failure with me, also all my friends, is Odontoglossum grande. Other Odontoglossums are doing well. I have tried to grow it in the bush-house referred to above, but it seems, immediately after receipt, to begin to dwindle, and does not make any fresh growth. The temperature in this house ranges in winter from 40° to 65°; and in summer, usually at night, about 60°, but sometimes 70°, and in the day time from 80° to 90°. Any advice that you can give me towards growing this Orchid will be esteemed a favour. Since writing the above I have received a flower of a New Guinea Orchid that, except it is cream-white on sepals and petals, is as nearly as possible the counterpart of the Solomon Islands Dendrobe referred to above. The lip and throat are marked in the same way, but not so strongly, and the plates on the lip are also very like. I may be able to send dried specimens. I cannot say what the plant (stems, &c.) of the New Guinea Orchid is like, as the flowers come from a correspondent in northern Queensland. *H. D., Sydney.*

BACTERIA AND INSECT PESTS.

In view of the rapid advance made in the study of micro-organisms, it is not surprising to find that bacteriology has already been requisitioned as an aid to the forester in checking certain forms of insect attack, against which all other remedies have hitherto been ineffectual. Continental coniferous forests are periodically liable to defoliation by the caterpillars of certain moths, just as our own Oak woods are frequently eaten bare and barren by the larvæ of the Oak-leaf roller-moth (Tortrix viridana). In the former case, however, the result of a severe visitation of this kind often attains the magnitude of a calamity, for the peculiarities of the Pine tribe, in regard to leaf and bud distribution and development, render a second or abnormal flush of leaves (such as occurs in the case of the Oak and other hard woods) practically impossible. Consequently, an attack by the caterpillars of such dreaded foes as the Black Arches moth (Liparis monacha), or the Pine-spinner moth (Geometra pini), may bring in its train the total destruction of forests over extensive tracts of country, compared with which our own insect visitations sink into insignificance. Until recently, the only practical means of checking, or attempting to check, the progress of these plagues have been the tedious and comparatively costly methods of placing a ring of specially-prepared "caterpillar-lime" round the stems of the trees to prevent the re-ascent of the caterpillars to the crowns, or by collecting the hybernating larvæ in and under the fallen leaves. In the Administrative District of Potsdam alone, no less than £6800 were spent in 1892 in tarring trees in the State forests, in order to counteract the attacks of the Black Arches caterpillars, and in other districts similar measures had to be adopted to preserve the forest growth.

The discovery in 1891, by Dr. Hoffman, of the bacillus of a disease which is invariably observed amongst the larvæ of L. monacha towards the end of their larval stage, has enabled the artificial introduction of this disease to the caterpillar swarms to be effected, and from the results hitherto obtained it is hoped that a timely inoculation with the bacilli of the disease may appreciably check the ravages of the pests, and prevent serious damage being done to the infested forest. The bacilli are cultivated in suitable media, such as Koch's culture gelatine, fresh flesh, cooked Potatos, &c. The healthy caterpillars are then infected by hanging out pieces of the flesh or masses of dead caterpillars which have succumbed to the disease, laying down a compound consisting of squashed caterpillar mixed with inoculated broth in trenches, or through direct inoculation of living caterpillars. The last-mentioned method is effected by pricking the last abdominal segment of the subject with an ordinary needle previously dipped in a fluid culture. Young caterpillars which are in the act of ascending the trees are selected for the operation, and these carry the infection to those in the crowns. The affected larvæ at first become dull and listless, and finally shrivel up, while the contents of the body are turned into a dirty-brown watery fluid. With a power of 600 to 700 diameters, the bacillus appears as a rod about 1 mm. in length. The disease is said to be highly infectious, and it is thought can be transmitted to a second generation by means of the moths and their eggs.

Whether this particular disease is confined to a single host or not has not yet been ascertained; but in course of time it is possible that other insect-pests may be found to possess parasitic bacterial diseases, which can be utilised with as beneficial results as in the case described above. The important part which parasites play in the life-history of certain insects has long been known. Insect species which appear in overwhelming numbers in one season are often extremely rare in the following one. In some instances, climatic conditions account for these suddenly appearing swarms, but climate alone cannot account for those cases in which the numbers of the pest gradually culminate, and then almost totally disappear. With these, further research by the scientist will probably reveal something that may be turned to practical account, and of service to all who are now troubled with visitations of gregarious forms of insect life, which probably at times receive little sympathy, even from an anti-vivisectionist. *A. C. Forbes.*

THE BULB GARDEN.

IRIS KÆMPFERI (LÆVIGATA).

There is a gorgeous characteristic splendour in these wondrous Japanese Iris. Strangely fantastic in form, and inimitable in their quaint beauty and the peculiar combination of colour often seen in their flowers, they occupy quite an unique position, not only in the lovely genus to which they belong, but also among hardy perennials as a whole. It has been well said of them that "they make a splendid finale for the Iris section, and their great, flat, broad, open petals are simply astonishing." Long after the other groups have given us their wealth of blossom, this section is a fitting finale to the rest of the species. The season of 1894 has been, on the whole, a favourable one for this section. Moderately cool weather, with occasional showers, is just what they delight in. To do them justice, however, in our gardens, we must not depend on the season. The greatest essential in their successful cultivation is moisture, and without this they make but a poor display. To ensure that the roots shall be within reach of water, they should be grown in beds by themselves, and preferably in beds where the surface is below the ordinary level. They are then easily deluged with water in their growing season, which is most important. Where opportunity offers, they should be treated as sub-aquatics, and they will revel in such a position. With abundant supplies of moisture, and even if the soil be at saturation point, and a liberal depth of rich vegetable soil in which the roots may ramble, they give little trouble, and will furnish an indescribably sumptuous display in the fullest sunlight with their huge blossoms floating in the breeze. No garden should be without them, though a special bed is needed for their reception; the cost of making is simple, and water is easily conveyed to them in many ways. A depth of about 18 inches of soil in equal parts of good-holding loam, leaf-soil, and peat should be prepared, and about one-sixth part of well-decomposed manure may be added. Old beds of these may with advantage be mulched heavily each autumn with the same material, allowing the old leafage to remain intact during the winter. New plantations should be taken in hand with as little delay as possible, planting them firmly but not too deeply. To plant these Iris in an unsuitable position is just to miss one of the greatest floral treats of the year. With annual mulchings of manure and continuous supplies of water from the end of March to the end of August, they yield a rich and unrivalled harvest of bloom. Somewhat impatient of frequent division, they should be left alone for several years to become well established. There are numerous varieties, and a wide range of colour, the latter including whites, rose, blue, purple, violet, maroon, scarlet, crimson, and others, while the elaborate markings are beyond description. *J.*

FOREIGN CORRESPONDENCE.

TERRESTRIAL ORCHIDS OF THE MARITIME ALPS.

It is seldom that one finds in a collection of terrestrial Orchids in England the alpine species well represented, which is undoubtedly attributable to the treatment they receive not being suitable to their requirements.

There are some which will succeed under ordinary conditions of an English climate, but also there are those which, to grow successfully, must have a period of rest. The varieties of Serapias, when seen growing in their native element, are for beauty unsurpassed by any of the more tropical terrestrial species which find a place in a glass-house; and yet I am sure they may be cultivated without a great deal of care as successfully as any others, and amply repay the cultivator for his pains. Having collected them, and studied the conditions under which they thrive in the Alps, I conclude that it is impossible to grow them without giving them at least four months of rest by withholding the watering for that period, or, if planted in a rockery, to give them the dryest possible place. These are the conditions under which they grow. The Serapias and Ophrys (each of which there are several species, especially the latter) are found growing in shady little nooks where sufficient moisture may be obtained during their growing season, which is from November to May. They may also often be found growing in the full sun, but they are never so happy as when growing in the shade.

I have also remarked that the finest plants, especially the Ophrys, are to be found growing in fungus formed by the decayed leaves which fell from the trees or undergrowth in which they grow. Epipactis latifolia, when growing together in quantity, is very effective, with its spikes of flower sometimes 18 inches in height. This species delights in growing in dry places. Its season of activity is very short, as it does not appear above ground before March, and as soon as it has flowered, it dies down again. Its tubers are generally deep in the ground, and often to be found on the solid rock.

Orchis, of which there are many species, are nearly all lovers of moisture. Orchis globosa I once found growing in quantity with Lilium chalcedonicum, and in a spot where little or no moisture could be obtained during the season of drought.

Where a collection of terrestrial Orchids is grown, it is impossible to keep them together in one group, and for the drought-loving species I have enumerated I should suggest the driest place to be found, planting them amongst limestone, and during rainy seasons protecting them by placing a hand-light over them. One point is evident, that in England they cannot be kept too dry both during the summer and winter months. *Riviera.*

THE CULTIVATION OF THE SUGAR-BEET IN PERSIA.

According to a recently-issued Government report from Persia, it is proposed to cultivate the Beetroot on a large scale for the manufacture of sugar, the whole to be under Belgian auspices. The matter of soil, climate, labour, and other details appear to have been thoroughly gone into with favourable results. Up to the present, it is stated that the Beet has been cultivated in Persia only for farm purposes, or as a vegetable for the market. It is usually of the red type, shaped like a Turnip; but varieties of the white and yellow forms are sometimes found. According to the Persian method of Beet culture, the earth is first stirred up to a depth of 30 or 35 centimètres with a primitive plough, but this only effects a banking-up of the soil, and does not turn it over as in Europe. The seed is then sown by hand. After sowing, the ground is irrigated every day till the seed springs up. When it is well above-ground, the irrigation is effected every ten days, and is continued to within fifteen or twenty days of the maturing of the crop, which is then taken out of the ground, either with the plough or the spade. As soon as the first crop is sown, the second is prepared as before. The sowing generally takes place about March 21, but in favourable years a little earlier, and the crop is harvested at the end of June. This latter crop is the more valuable, and gives a heavier proportion of saccharine matter.

The Persians preserve the vegetable in silos as in Europe, or in underground caves specially arranged for the purpose. In 1893 experimental growing was essayed of the variety of Beet requisite for the sugar industry, from which it appears that the Beet produced contained an equal if not superior richness of saccharine matter to that obtained in Europe. An analysis made at the end of July, 1893, gave the proportion of sugar as 13·6 per cent. for the July crop, and 14·6 per cent. for the September crop. A further report dated Brussels, February 11, 1894, gave the following result of an analysis made at the laboratory of the Tirlemont Raffinerie:—Weight of Beet, 430 grammes; saccharine matter, 15·20 per 100 grammes. A note attached to this report states that these results are remarkable. It is proved that the Persian Beet exceeds in richness the average Beet of Belgium, which does not give more than 13 per cent. of saccharine matter. Further, allowing a loss of 1 per cent. of sugar during the voyage of the Persian Beet, the original richness would be about 16 per cent., and its value in Belgium about 40 francs per ton at least.

Various estimates have been made of the weight of Beet per hectare, but latterly a more exact figure has been arrived at, after the experimental culture conducted near Kerisec. Experts now report that 30,000 kilos. may be taken as a moderate computation. At this rate it will require 700 hectares to produce the 20,000,000 kilos. required for the sugar factory annually. As the sugar Beet has never been cultivated by the people till now, no satisfactory valuation can be made, but basing their calculation on the price of other agricultural products, the experts give it as their opinion that the Beet could be delivered at the factory at 18 fr. per 1000 kilos. including a fair profit to the cultivator.

The writer of the report from which these facts are gathered proceeds to give the results of a visit to plantations of Beet in the neighbourhood of Kerisec, and compares the Persian system of cultivation with that of the Belgian. Items of expenditure and profit are also considered, and the report concludes with the following prophecy as to the future of the Sugar-Beet in Persia:—Success may depend on the amount of capital behind the company. It is probable that works may have to be carried on with little or no profit, or even positive loss, for the first year. If the company can afford to do this, and show its ability of keeping the industry afloat, I believe there may be large profits to be garnered in the future, for my calculations are based in every instance on the most pessimistic calculations of others. I feel persuaded, therefore, that with the support of the Shah and his Government the sugar industry will pay.

Fig. 101.—Sir Watkin Daffodil: as figured in Hale's "Eden." (see p. 774.)

BOOK NOTICE.

Rhodologia: A Discourse on Roses and the Odour of the Rose. By I. Ch. Sawer, F.L.S., author of "Odorographia." (Brighton: W. J. Smith, 43, North Street, 1894.)

As might be supposed from the title of the little book before us, and from Mr. Sawer's previous work, *Odorographia*, his latest issue deals chiefly with Roses as perfume-yielding plants, and embodies a good deal of the matter which appeared in the first volume of *Odorographia*. The reason for bringing this material together interspersed with other and more recent matter, and for publishing it in its present form as a separate book, is stated by the author in his preface to be that of interesting "persons located in some of our colonies where the climate, &c., is suitable to the development of the Rose. The Rose industry is capable of great extension, and the demand for the products of this flower is increasing."

After referring to the popularity of the Rose amongst all classes as a cultivated flower, the author says, "Notwithstanding this great enthusiasm, it seems that both cultivators and admirers of this flower concentrate their whole attention on the development of colour, form, and size, and pay little heed to the great variety of perfumes generated in the beautiful petals. These different odours (although, of course, blended with that of rose), are distinctly recognisable, and are in some cases very marked. The sense of smell can be trained to the appreciation of perfumes, especially in young persons, as easily as the palate can be trained for business purposes, to the tasting of the flavours of wines, Tea, or Coffee. Of course a taster, sampler, or valuer of such beverages, must naturally be possessed of a finely-developed nervous susceptibility to the slight variations occurring in every sample which comes under his notice. Such natural perfection of susceptibility is not common, although many possess the gift without being quite aware of it, they may not be in the Tea trade or the wine trade, or any trade at all; and so the gift is not trained or even appreciated. To those who are not constantly occupied in the culture of the Rose, it may seem that one Rose is very much the same as another, and excepting a few variations in colour and habit of growth, there is very little difference distinguishable. Probably many persons would never believe that there are not only Roses perfectly devoid of odour, but there are

*

some which stink. There are experienced gardeners who can name many varieties of Rose in the dark; this means that the perfume of Roses is varied, and that no two varieties possess the same odour. What is called pure odour of Rose is unique, undefinable, incomparable. It is, in fact, a type, and no imitation can approach it. It may be best represented by the Rosa centifolia and R. damascena." This paragraph is a sample of how Mr. Sawer writes, and though we may not agree with him in all his points, it illustrates his enthusiasm in the subject which he has taken up. Following upon this, he proceeds to describe the odours of different varieties and species of the genus Rosa, referring one to the odour of Melon, another to the Peach, another to the Violet, another to the Mignonette, and so on, and many interesting notes are given in this connection as, for instance, that the flowers of R. gallica, which are used officinally, are but feebly odorous when freshly gathered, but the perfume develops gradually in the process of desiccation, while that of the Damask Rose is almost destroyed by drying. That the perfume trade should have to depend almost entirely upon the Bulgarian Rose plantations for the supply of attar or otto of Rose does seem somewhat anomalous in these days of extended culture of useful plants, and one of the results of Mr. Sawer's essay may perhaps be the introduction of the favourite flower for the purposes of distillation into some other countries possessing soil and climate suited to the development of the precious oil, for precious it is when we consider the comparatively small yield and the very high price, for it is estimated that 2,000 Rose blooms are required to yield one drachm of otto, the market value of which may vary from 25*s.* to 30*s.* per ounce. Some idea of the extent of the Rose culture in Bulgaria may be gained from the fact that the average annual yield of ottos ranges from 55,000 to 58,000 ounces, and to produce this the flowers are gathered in the early morning before they expand, and rapidly submitted to the distilling process. Though Rose-growing for perfumery purposes has been established in Germany and France, and though a well-known authority on perfumes has for years past advocated the establishment of Rose and other flower farms in Fiji, Queensland, and Swan River, there are still opportunities for further development in this direction.

TREES AND SHRUBS.

THE SCARLET OAK.

The brilliant autumnal colour assumed by the large leaves of this handsome American Oak (Quercus coccinea) renders it of great value in ornamental planting. The colour of the leaves is not confined to the mature growth, for the peculiar bronzy-red of the young growth is nearly as beautiful as the autumn hues. The second growths are also very conspicuous by their rich shades of red and bronze. The contour of the tree is pleasing, and has therefore much to recommend it to the planter; and it is neat, yet destitute of stiffness. We have it planted here amongst Birch, Horse Chestnuts, and Aspens, whose leaves usually die off of a deep golden hue, and the colours of the scarlet Oak make beautiful contrasts with these. Last autumn the other trees did not possess such fine tints as usual, but the Oak was beautiful as ever. The seedling forms of Quercus coccinea vary greatly in the intensity of the leaf colouring, some turning to a reddish-brown before falling off.

A well-grown and well-placed specimen of the best variety is a very desirable object when planted so as not to be encroached on by other trees, and when backed up by clumps of Holly, Yew, or Pines. It is a suitable tree for planting at the borders of hardwood plantations, especially such as skirt the roads and drives, whence it may be readily seen. I have seen this Oak planted in damp, low-lying positions, but the trees were not a success, their side branches dying off in course of time, tufts of foliage forming on the top only. *A. Evans, Lythe Hill.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

MEXICAN LÆLIAS.—Those plants whose flower-buds were not injured by the recent fogs, are now making a fair display, but the spikes are less numerous than last year, the chief causes for this being first, the majority of the plants were disturbed by repotting, an operation they do not, as a rule, speedily recover from; secondly, deficiency of the sunlight and heat this year, so very essential to grow Lælias at their best. Of this Mexican species may be named L. anceps, L. a. Barkeriana, L. a. Protheroeana, L. a. Dawsonii, L. a. alba, L. a. Leeana, L. a. Stella, and others. Mention should be made of the beautiful L. autumnalis and its almost pure white form, L. a. alba; the pretty small-growing L. albida and L. furfuracea. The latter species enumerated come from higher elevations than L. anceps, and require a few degrees less heat whilst making growths; this is also true of L. majalus, a variety which produces its lovely flowers from the half-formed bulb early in the month of May. When these plants have done flowering, water must be almost withheld, but the pseudobulbs should be kept quite plump. The temperature should be kept at 55° by night, and the air of the house comparatively dry; fresh air in quantity compatible with the weather should always be afforded. Lælia rubescens, better known as L. acuminata or L. peduncularis, is a dwarf, compact-growing species, that is best cultivated in shallow pans or baskets of teak, suspended when the plants are growing, where a maximum amount of light is obtainable, a good position being one that is close to an upper ventilator in the warmest house. This species being now at rest, the cooler atmosphere of the Mexican division is preferable for them. The time to repot Lælias is when they commence to show new roots, but unless repotting is very necessary, owing to decay of materials or of the basket, the plants had better remain undisturbed. Healthy specimens, which have sufficient space in which to grow, should not be interfered with except for the reasons stated.

VANDA AMESIANA.—According to the conditions under which this plant is cultivated, it will be in bloom at the present time—or soon will be. To prevent the spotting of the flowers, which is a common mishap, the Mexican-house, with its drier air, should be chosen as its home, and if it be kept without water at the root, the flowers—which are, by the way, very fragrant—will last a long time in good condition. The same kind of treatment will suit Broughtonia sanguinea, a species not often seen in bloom, but a very effective plant when well done. Suspended from the roof of the Mexican-house are some Epidendrum atropurpureum (macrochilum) and the white variety, which are showing their flower-spikes. They need very careful watering at this season, or the flower-stems will turn black and the flower-buds will drop off. This is a useful and beautiful species, particularly the white variety, lasting long in perfection, and the flowers are fragrant. Plants of Dendrobium Falconeri and its variety giganteum, distinguished by its longer and stouter pseudobulbs and flowers nearly as large again as the type, should not be subjected to much dryness at the roots, or the growths will become generally weaker each successive year. A rest with great dryness produces abundance of bloom for one or two seasons, but with the effect mentioned. The plants should be kept in the Cattleya-house through the winter months, during which time the pseudobulbs should not be kept so dry that shrivelling takes place.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

THE FIGS.—In the early-house of Figs in tubs and pots everything should now be ready for starting the trees. The soil, which in most cases will be dry, should be saturated with tepid water before the pots are plunged in the hotbed. The latter should be capable of affording a steady bottom-heat of 75°; the temperature of the house being at the commencement 55° to 60° by night, and 10° to 15° higher by day, the higher figure when the sun shines warmly. Lightly syringe the plants once daily with warm water. If bottom-heat is not afforded by means of hot-water-pipes, a bed of Oak or Beech leaves and stable-dung may be used. Great attention must be given to the watering in the early stages, water being applied only when it is really required.

APRICOTS.—Trees in glass sheds or houses should now be pruned, trained, and generally put in readiness for starting. In replanting old trees, or planting new ones, no time should now be lost; as the mild winter hitherto experienced will induce these early flowering trees to burst early into blossom. Old trees which may be infested with scale should be syringed thoroughly twice over with petroleum in solution, as previously recommended, doing this whilst the buds are quite dormant.

ORCHARD-HOUSES.—Clean, train, pot, and top-dress all trees, and let the drainage of all plants in pots be made good, this being a chief point in the pot-culture of fruit trees. When arranging the pots place each tree on two bricks or thick tiles, so that the drainage-holes may not be choked with earth. Trees planted against the wall should be loosened from their supports, and tied in bundles, so that they may not be broken, whilst cleaning is being done; the walls should then be whitewashed, and the holes in them filled up. It may here be remarked that walls are the most serviceable for fruit-houses which are cemented over, being easily cleaned, and harbouring no insects injurious to plants.

MELONS AND CUCUMBERS.—Hotbeds may now be prepared with equal quantities of tree-leaves and stable manure, mixed together, thrown into a heap for a week, then turned sides into the middle, and again shaken out and put into a heap to further ferment before using it, the whole operation lasting ten days or so. When the stuff is sweetened somewhat, a bed or beds may be made up, in height 6 feet at the back, and 4 feet 6 inches at the front, and about 2 feet wider and longer than the frame which will be placed upon it, beating and treading the materials during the making. Put on the frame and lights, leave some apertures to let out the steam, and if the weather is cold protect the sides and ends of the bed with litter. A sheltered situation, facing

the south, should be chosen for the bed. When making ready, place inside the frame a sufficient quantity of cocoa-fibre to plunge the pots in. When the bed has settled down, and free from rank vapours, and the temperature at about 70°, the seeds may be sown in 4 or 6 inch pots, in sandy loam or leaf-soil in about equal parts, covering the seeds with half an inch of fine soil, and the pots with a piece of glass, shading with a piece of brown paper till the seedlings are up, and giving no water till then. Great care will be needed in airing the frame and managing the bottom-heat, which should not be much over 80°. Cover well at night, uncovering early. As soon as the seedlings are large enough to handle, pot them off into 60's in warm soil; do not water them until they have made a few true leaves, and are rooting strongly. Another way is to sow seeds low down in the pots, and earth them up as the plants grow in height. Cucumbers need shade from bright sunshine, and to be kept sturdy.

TOMATOS may be raised in the same frame by sowing the seeds in 6 inch pots of sandy soil, covering them with a quarter of an inch of fine soil, watering and covering the pots with a piece of glass and one of paper till the plants appear; then keep them as near the glass as possible, and pot-off into 4-inch pots when large enough; and when rooted into the new soil, give them a light place in a warm airy house.

STRAWBERRIES. — Plants coming into bloom should have a light house and a temperature of 55° by night, 65° by day, with a little air left on all night. Afford ample supplies of water, and brush them over twice daily to fertilise the blooms, afterwards thinning the fruits. For a succession a batch of fresh plants may be brought in for forcing at intervals of three weeks.

EARLY VINES coming into bloom should have a brisk temperature of 65° to 70° by night, 75° to 80° by day, with a good circulation of air, and not too much moisture in the air. During these dark days it is good practice to fertilise all varieties, taking pollen where it is most abundant for setting shy varieties, and be careful in ventilating the vineries.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

COB AND FILBERT NUTS.—The catkins on Nut-bushes being unusually forward, the bushes should now receive what pruning is necessary, and the amount will depend upon the degree of attention the bushes have received in previous seasons. If pruning has been properly done annually, the branches will be somewhat regular, and the operator's attention will be needed in removing sucker-growths, thinning-out weak spray, and any crossing branches. Bushes giving most trouble from suckers are those which have been raised from seed. Cuttings of short-jointed growths of the current season, 18 inches to 2 feet long, strike freely. All the eyes, except three or four at the top, should be cleanly taken out. The cuttings may be put out in rows 18 inches asunder, and 1 foot apart in the row; any cool border will suit them. If nuts are to be grown extensively—and some growers have proved them to be a remunerative crop—the major portion should be Kent or Webb's Prize Cob, between which there is but little if any difference. The Cosford is a free bearer and a desirable nut, but the bushes grow tall, and require to have the branches lopped back occasionally to keep them in reasonable limits. Bushes on stems about 4 feet high, and planted from 15 to 18 feet apart on grass, make short-jointed growth, and the nuts consequent on full exposure to the sun and air, ripen and keep better than they do when the bushes are crowded together, as is most usual. Old bushes, apparently worn out, can be greatly benefited by a good top-dressing. Should the staple be of a clayey and too retentive nature, apply a top-dressing of charred garden-refuse, sandy loam, or well-decayed leaf-soil. But if the opposite be the case, then a heavy top-dressing of clayey loam, or even pure clay, if afforded now, to be well pulverised by the frosts, will aid in resuscitating the bushes.

BLACKBERRIES.—Where these are trained to a wire-trellis, the old bearing growths should be removed, and the young growths trained in thinly. The cut-leaved variety (Rubus laciniatus) is considerably more trailing in habit than the American and other varieties. Should these be planted too closely together, have the plants thinned out to a distance of about 12 feet apart, and they will be more manageable, and there will be less necessity for shortening back to any great extent the long fruiting growths. The introduction of Wilson Junior and other American varieties a few years since gave a great impetus to the cultivation of Blackberries. Such a season as that of 1893 met the requirements of this variety in whatever position it was planted, and hence the more satisfactory crops of it generally this season, but unless a dry and very sunny position can be given them, the cultivation of Wilson Junior, fine berry though it is, should be of a limited extent, and dependence placed upon the cut-leaved variety for supplying fruit for the kitchen. When the canes are trained to a trellis, the fruit can be the better protected from birds; but in places where birds are not numerous, the most natural and profitable way to grow them in quantity is over a rustic archway spanning the garden walk; stout Oak-posts can be used for the sides, and ¾-inch round iron for the arch, with rods of Oak, Hazel, or other enduring wood, laid lengthwise along the arch to carry the growths. Such an arch will last for some years, and when necessary it can be rebuilt piecemeal. If the brambles are cut down from the part to be renovated, they will make bearing growths again the following season.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

TULIPS. — The Tulips planted early in the autumn will, in some gardens this season, be pushing through the soil, showing an abnormally early growth. To prevent injury to the plants from hard frost, which we are sure to have, the beds should be surfaced with some finely-sifted leaf-mould and sand, well-mixed together, or failing leaf-mould, the more expensive cocoa-nut fibre refuse may be used.

THE HERBACEOUS BORDER.—Now that most of the perennial plants are cut down, a dressing of decayed loam and short stable-dung in equal quantities, which should have been prepared and thoroughly mixed, should be spread over the soil. Old-established borders are especially benefited by such dressings, owing to their commonly impoverished condition. Having spread the dressing, carefully prick it in with a fork; but this is an operation that had better be left until the spring, and the new growth of the plants indicates their whereabouts to the workmen. The dressing, moreover, if left on the border affords a great protection to tender plants and bulbs; and in wet, cold soils, protection of some description is always a necessity.

BOX-EDGINGS.—Where Box is largely used as an edging-plant, it is prudent to grow a supply of it in the reserve-garden, so as to be able to repair the edgings when needed. If the soil of the edging is poor and sandy, it should either be removed, or sufficient good soil mixed with it before proceeding to plant. It is of great importance in planting Box that the soil be made very firm and level, and the lines cut quite true, whether they are straight or otherwise, and never to cut the tops of the Box-plants before they have got a good hold of the soil; in fact, no Box should be cut when there is the least fear of frost occurring before growth is made anew.

CLEMATIS.—All varieties of the Jackmannii or viticella type may be cut down to about 10 inches or so from the ground at this season, and a good mulching of farmyard-manure afforded them, cow-dung being one of the best for the purpose. This dressing may be applied quite 6 inches in thickness. Those belonging to the lanuginosa type should be moderately pruned, and those of the patens and Florida types left alone at present.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

ENDIVE AND CHICORY. — The usable Lettuces having become scarce in most gardens, Endive and Chicory will be more prized. Both require to be artificially blanched by placing them in darkness, the former by tying the leaves together when dry, lifting the plants and planting them in boxes, which, if put in the Mushroom-house, will come on quickly. The broad-leaved Batavian Endive is the best to grow at this season, and takes the place of the Lettuce more satisfactorily than the moss and other finer-leaved varieties. Chicory may be planted in pots and boxes in moist soil, and brought forward in the darkness and warmth of a Mushroom-cellar, taking care that it does not lack water, or the leaves will be tough.

FORCING FRAMES.—Admit air sparingly, avoiding draughts, and closing early in the afternoon. See that a proper degree of warmth is maintained, the French Bean requiring a minimum of 60° to do well.

ROOT STORES.—In bad weather the men may be employed to examine the roots in the various stores, removing all decaying ones, and the sprouts, which the mildness of the season has caused to be put forth.

MUSHROOMS.—Out-of-doors ridges may be made, and failing other soil that of the kitchen garden, if afforded a sprinkling of bone-meal, gives satisfactory results, still, fresh loam is the best for covering the beds. Beds which are getting dry should have warm water applied to them, a fresh covering of litter being put on to keep up the right temperature, and preserve the moisture. Ridges in bearing should also have fresh litter, especially if that which has been in use is much broken up or mouldy. Where the spawn may be running in places on the outside of the soil, remove it by rubbing with the palm of the hand, and cover up the ridge with entirely fresh dry litter sufficient in depth to raise the temperature of the surface of the bed. New beds may be made as required in Mushroom-houses and cellars, the temperature being kept at 60° steadily, and the air moderately moist. Spawn beds when, after a rise, the warmth has declined to 98°.

GENERAL REMARKS.—On frosty mornings manure may be carted or wheeled on to vacant ground, spreading it or leaving it in heaps to be spread when wanted. Heaps of garden refuse may now be turned over and thrown together in a compact flat-topped heap; all thick sticks, and Cabbage-stalks not readily decaying, should be burnt later on. The heaps of older date may be wheeled upon vacant ground, which will be trenched, or bastard trenched. When the ground is in working order, press forward digging and trenching operations, leaving the surface rough.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

CARNATION SOUVENIR DE LA MALMAISON. — At this date the flower-spikes of the earliest-rooted layers should be visible, and it is a matter of some importance that green-fly does not get a foothold on the plants, as the least injury done on the present tender state of the buds will destroy all chance of getting perfect flowers. As a stimulus to growth, very weak soot-water may be afforded once a week alternately, with clear cowdung-water. Older plants which may now be exhibiting their flower-buds, or approaching the flowering stage, should be similarly treated, save that the strength of manures may be increased with safety, the plants being better rooted. The damping of the paths, benches, &c., may still be kept up, except in rainy or foggy weather, and the ventilation of the house or pit must be well attended to, air being afforded more or less in quantity at all times, except during severe frosts. Air being so necessary to the Carnation to prevent an undue lowering of the warmth, some slight heat may be allowed in the pipes at all times. If the young stock of plants was placed in 60-pots, and they have not received a shift, the present is a suitable time for repotting them.

STAGE (SHOW) PELARGONIUMS. — Pinch the points off and regulate the stronger shoots, and as they advance sling the branches with matting to the central stick, and if sufficiently well rooted apply a teaspoonful of Thomson's manure once a fortnight, sprinkling it over the surface of the soil; admit air in quantity when there is no frost or fog, and afford then a slight heat in the hot-water pipes. The underside of the foliage may be syringed in the early part of the day, applying the spray somewhat sharply.

ALLAMANDAS.—A few of the well-matured plants may be shaken out and repotted into larger sized pots, if it is desired to increase the size of the plants, using the kind of compost recommended in a previous calendar for plants of this class. Afford them water as soon as placed in the stove, but affording no more till root-action become visible in the swelling of the buds. Allamanda Hendersonii is the more easily-grown variety, and is for that reason more generally cultivated. A. nobilis has beautiful blossoms, but it is of weak constitution; and A. Schotii is a very useful variety.

GLORIOSA SUPERBA.—A few potfuls of this lovely subject may now be made up, using the same kind of soil as the previously named plants require, no water being applied. Plunge the pots to half their depth in a warm bed in the stove, and the moisture of the house will suffice to push the tubers into growth. Place one or more sticks to each pot when the growths make their appearance, fastening these to them very carefully when they are long enough, remembering that a broken growth will do no more good this season.

1894. THE year of grace, 1894, whose history, so far as matters horticultural are concerned, we have now to trace, has been a very busy one. There has been no very striking event, no epoch-making discovery, no startling introduction, but a continuous record of steady persevering work. Signs of progress may readily be discerned, the most hopeful among which are the recognition of the necessity for increased knowledge as well as mere skill, and the consequent gradual spread of technical education. The interest in such matters as Hybridisation may be alleged as another sign of progress, whilst the establishment of a School of Cultural Science at Cambridge is an event of good augury. Commercially the year has been better than its predecessor, and whilst agriculture is depressed beyond measure, horticulture in its various branches is flourishing. True, a pessimistic note as to the prospects of commercial fruit-growing has been, as oft before, sounded by Mr. R. D. BLACKMORE. To know that gentleman is to esteem and respect him to a degree that he would hardly care to have publicly expressed. But our admiration for the man and his attainments must not blind us to the fact that, although opportunity has been afforded for others to substantiate his views, yet no one, except our old friend Mr. HARRISON WEIR, has yet done so. We do not for a moment question his ability as a grower, nor doubt the information he has conveyed to us in support of his assertion—information that cannot be made public. But on the other hand, we cannot but see that up to the present Mr. BLACKMORE'S experience is somewhat exceptional. Not only nurserymen who have fruit trees to sell, but market-growers who look to derive an income from their produce, tell us a different tale. They are not enthusiastic, these gentlemen, and they are not enamoured of the way business is conducted in Covent Garden, but their statements are all the more worthy of confidence, in consequence. Some are, from their experience, advocating market gardening and fruit culture as a profession for the sons of gentlemen. It seems that under fairly propitious circumstances a satisfactory, if not a large return, can be made from capital and labour judiciously expended in this business. Can as much be said for farming now-a-days?

The subject just alluded to has formed one of the most prominent subjects for discussion this year, and hence we put it in the forefront of our review. To do so is rather like putting the cart before the horse, for perhaps we ought to have begun with the weather. Nothing eludes our memory sooner than the state of the weather, but no cultivator is ever likely to forget the dry, roasting season of 1893. Its effect on such vegetation as could resist excessive drought was remarkable. "Well-ripened wood" led growers to expect abundant flower and fruit as a consequence. The early part of the year was for a short time exceptionally cold. This state of things did not last long, but was succeeded by mild weather. It seemed as if the promise of the ripened wood was to be fulfilled. And to some extent it was. The fruit trees and flowering shrubs were sheeted with exquisite bloom. The spring was from two to four weeks in advance of the average, and all seemed well; but in the fourth week in May came a frost—indeed, a "killing frost." Such low temperatures as were experienced in nearly all districts of these islands have scarcely ever been recorded at this season of the year. The trees were in the full flush of active vitality. The havoc was proportionate. Dismal was the outlook. Strange to say, the fruit crop, as a whole, proved not to be so deficient as was expected. Apples, indeed, have been scarce, but Pears were in profusion. After May we have had but an indifferent season—fitful sunshine, a moderate amount of heat, a plentiful supply of rain. The promise is not so good as it was this time last year, but who can say that the fruition may not be better?

A popular clamour about the management of Epping Forest led to the appointment of an influential and representative committee of experts. Their report showed, as usual, that clamour such as shows itself in the columns of general newspapers from the *Times* downwards, when dealing with special subjects was as ignorant as it was "popular." The Corporation did wisely to settle the matter as they did, and with the general terms of the report submitted to them no practical man will disagree. The increase of the beauty, interest, and educational value of the forest by the judicious introduction in appropriate localities of trees and shrubs not native to Essex is, however, a point in which we think the committee was too tender and too heedful of the ignorant clamour aforesaid. Epping Forest is quite extensive enough to have hundreds of acres left relatively wild, and hundreds more devoted to the purpose of a national arboretum, which, for the satisfaction of the newspaper scribes, we may explain is not a dressed garden.

Of the novelties and interesting introductions of the year we shall speak at length in our succeeding numbers, but here we may remark that the shows and exhibitions at which these novelties for the most part make their appearance have been unusually numerous. The series of shows in connection with the great exhibition at Antwerp have been well conducted, and have afforded our exhibitors an example alike of good taste in arrangement and patriotic disinterestedness.

At home the Temple Show was larger than ever, and the quality of the exhibits excellent, but as regards the arrangement, the least said, the better. The weather on the occasion was deplorable, but the results were financially satisfactory. The great fruit show at the Crystal Palace, organised by the Royal Horticultural Society, was very successful—so much so, that we hope the Society will continue to put itself, as it ought to do, at the head of all these larger and more important exhibitions. The Conference on fruit-growing in connection with this exhibition was very appropriate, and the interest of the people was manifested by the way in which the room was packed with auditors, on the second day a still larger room being necessitated. The ordinary committee meetings of the society in the Drill Hall have been well attended, and the exhibits, if anything, too numerous.

At Chiswick one general meeting, and one only, was held, and that was devoted to trees and shrubs. A magnificent collection of illustrative specimens was got together, but the weather was as unfavourable as it was possible to be, and the management of the Conference was such as might have given rise to the impression that the authorities were not particularly desirous that these meetings at Chiswick should be successful. The mention of Chiswick recalls the fact that the garden now presents a very different appearance from what it did in the old South Kensington days. Two old houses still remain as if to show what has been, and they form a marked contrast to the rest of the establishment. Old houses have been repaired, new ones built, long lines of dilapidated pits restored, and a general state of good keeping ensured. The trials of flowers, fruit, and vegetables have been continued, and the judges and committees have shown their usual critical acumen and disinterestedness. We can hardly over-estimate the value to horticulture of these trials, which no private efforts can adequately replace.

More, a great deal more, requires to be done in purely scientific and experimental horticulture, but this demands money, and more especially men, for the purpose. Most horticulturists are already overburdened with work of one sort or another, and so are the officials of the society. It is a dream of the future that eventually we may have at Chiswick, under competent scientific direction, a station for research and experiment in the higher branches of horticulture, comparable with the dozens that exist in the United States and in some of the countries of Europe. It could be worked with the present system of trials, and incorporated with a practical system of technical education. When will our dream be realised?

Before leaving the Royal Horticultural Society, mention must be made of the Lindley Library. The history of this nearly fundless establishment is now well known. Hitherto the advantages it offers have been comparatively made little use of. One reason for this is the absence of any proper catalogue—especially of a subject catalogue; and hence one of the first objects of the Trustees is to provide for the formation and publication of such a list. The subscriptions received up to the present time are not nearly adequate for the purpose; but we doubt not that, as greater publicity is given to the matter, not only funds will flow in, but also donations of horticultural books, so as to render the library, what it ought to be, the most complete of its kind.

The mention of books reminds us that in addition to a host of elementary treatises on horticultural and botanical subjects, many of greater importance have been published within the year. The foremost in value is, of course, the *Kew Index*, comprising the names of all flowering plants from the time of LINNÆUS to 1885. Of this colossal undertaking we have spoken at length, it only remains to say that there is every probability that the work will be completed by midsummer of 1895. Professor VINES has published the first part of his *Text-book of Botany*, intended for advanced students. Dr. SCOTT has published an *Introduction to Structural Botany* for the use of less advanced pupils, and which is an admirable production. The popularity and interest in Orchids and their culture has received striking illustration in the publication of several bulky volumes devoted to them. Mr. BOYLE has entwined them in fiction, in the *Orchid Seekers in Borneo*, and enticed amateurs by the narration of his success as a cultivator, as published in his *About Orchids*, a chat.

Mr. BURBERRY has published a useful little book for amateurs. Count de KERCHOVE has issued a delightful introduction to the knowledge, the structure, and peculiarities of Orchids (*Le Livre des Orchidées*), but for cultural purposes he would have done better to have adhered to established usage in the matter of nomenclature.

M. LUCIEN LINDEN has laid before the public a treatise, *Les Orchidées Exotiques*, in which the reader gets the benefit of the vast knowledge and experience of MM. LINDEN, père et fils. Messrs. VEITCH have brought to a conclusion their most valuable and authoritative *Manual of Orchidaceous Plants*, the success of which will, we hope, be sufficiently great to justify a new edition, with the subject-matter rearranged, and

with all important new matter incorporated. Messrs. Williams & Son have given us another edition of their *Orchid Growers' Manual*, which is specially useful for gardeners.

In other departments of horticultural literature we may mention Prof. Sargent's magnificent form. The translation of Prof. Kerner's *Natural History of Plants*, issued under the editorship of Prof. F. Oliver, is progressing regularly. It contains a fuller account of the life-history of plants than any work we know of, but it is a big book, and few of not be infringed upon. A glance at the index to our half-yearly volumes will show a full list of the books of the year, as well as of the new plants and the principal figures issued.

The retrospect of the obituary column is always a sad affair, but it is tempered by the

Fig. 102.—Oncidium ornithorhyncum albiflorum: flowers white. (see p. 782)

Silva of North America, which is progressing satisfactorily, and is a veritable encyclopædia of the subject on which it treats, illustrated in the most conscientious manner. The translation of Hartig's *Diseases of Trees* will be serviceable to foresters, but requires to be extended in its scope. The new edition of Brown's *Forester* is practically a new book, and in its present guise will do more to justify its reputation than did its original

us engaged in active work can find time to read consecutively, so that we trust a full synopsis of contents will be given to facilitate reference. The *Book of Choice Ferns* is completed. We have not yet seen it, but experts report very favourably of it in our columns. We might, and perhaps ought, to mention many more books, horticultural and botanical, but our space is limited, and the patience of the reader must

fact that those who have gone before have done their duty here, and that they have, by their example—if by no other means—rendered it easier for their successors to do the same. Duchartre, the eminent French botanist, described as the soul of the National Horticultural Society of France, died full of years, but at work to the last. His clearness of statement, and logical presentment of facts, were eminently

French, and rendered his *Elemens de Botanique* a delightful book to read. His contributions to horticultural literature were incessant, as the *Journal* of the Society shows.

Germany has lost one of the ablest and keenest botanical exponents in the person of Professor Pringsheim, but, so far as we know, he did not devote attention to horticultural subjects. It was otherwise with Spruce, the eminent English traveller and botanist. In spite of long suffering and broken health, he collected in North Brazil an immense number of plants, and contributed especially to the successful introduction of the Cinchona into India. His researches among the Hepaticæ place him, in the opinion of specialists, among the foremost in that branch of knowledge. Thomas Lobb was a famous collector employed by Messrs. Veitch, and not the least successful of the many explorers sent out by that enterprising firm. A list of the plants introduced by T. Lobb, is given in the *Gardeners' Chronicle*, p. 636, May 19 last. Dr. Bancroft, of Brisbane, an occasional correspondent of ours, was much interested in cultural affairs, and published various notes concerning them.

Among practical gardeners, we have to mourn the loss of the accomplished William Ingram, of John Rust of Eridge, of Gower, lately attached to the staff of the *Garden;* of Truelove, an old Kew employé; of W. H. Williams, of Salisbury, the head of the famous firm of Keynes, Williams, & Co., a loss the sadder because so premature. From among our own frequent correspondents we have lost C. Carmichael, and Henry Evershed, whose brightly-written articles were so much appreciated by our readers.

We might extend the list. We might dilate at greater length on the events of the year, but there is no necessity to repeat what has already been said in our half-yearly volumes. It will suffice if we have succeeded in conveying a general impression of the work done during the year now at its end.

The Gardeners' Royal Benevolent Institution.

We have received the following letter from the Treasurer with reference to some recent correspondence:—"In your issue of this week I notice a letter from Mr. Henry Cannell, with a footnote added by yourself, in which reference is made to the Treasurer [and certain members of the committee] of the Institution, allowing his name to appear on the circular of one of the candidates for election next month, and in which votes are solicited. Until I read this communication, I was not aware that my name was being used by anyone, and it is being done without my knowledge or sanction. I have seen no circular with my name on it, and I am consequently still quite in the dark as to who the offender may be. I am very sorry that Mr. Cannell should have 'nursed his grievance,' instead of having done me the kindness to communicate with me immediately after the receipt of the circular in question, and which would have enabled me to put a stop at once to what I consider a very objectionable proceeding. I hold that, in my official capacity, it is not right that my name should be used in favour of any one or more of the candidates; and whenever I have been asked to allow it to appear on any card or circular, I have always refused.

"As regards the present system of voting, to which, I understand, Mr. Cannell takes objection, I am no more in love with it than he is; but any alteration now, so far as I can see, would be very difficult. The Committee is only continuing to carry out the same system which has always existed, and it has no power to make any alteration, which can only be made at a general meeting of the subscribers, either annual or special. The latter could be held at any time; and if Mr. Cannell will elaborate an improved scheme for the election of pensioners, and be prepared to bring it forward for consideration, I feel certain that he may rely upon the cordial assistance of the Committee in carrying it, and certainly the active support of myself as the Treasurer. *Harry J. Veitch, Royal Exotic Nursery, Chelsea, December 22.*"

Our Almanack. — Secretaries of Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1895, for insertion in the Almanack, to be published in our issue for January 5.

Oncidium ornithorhyncum albiflorum.—Fig. 103, p. 781, represents a finely-grown specimen of this lovely Orchid, which was grown in the gardens of R. I. Measures, Esq., Cambridge Lodge, Flodden Road, Camberwell, and we are indebted to Mr. Chapman, the gardener, for obligingly sending us a photograph of it. The white-flowered form of Oncidium ornithorhyncum first appeared in the collection of the late John Day, Esq., at Tottenham, in 1873 (see *Gardeners' Chronicle*, 1873, p. 503), having been imported with the species from Guatemala. It has always been a rare and valuable plant, and as late as April last a small plant was bought by one of the largest horticultural firms at Messrs. Protheroe & Morris' Rooms for 28 guineas, and a plant had previously been sold for 50 guineas. Usually it is not so free-flowering as the ordinary species, but when it can be induced to succeed, it is one of the finest Oncidiums in cultivation. It does best in an intermediate-house, with a temperature of from 55° to 60° in winter, and 60° to 65° in summer. The pots should be well drained, and filled rather more than two-thirds with clean, broken crocks, using afterwards good peat and sphagnum-moss in equal proportions, which should be pressed with moderate firmness about the roots. The plant requires a liberal supply of water at all times, and a fairly moist atmosphere. Mr. Chapman experienced some difficulty in inducing the flowers to open last year, owing to the fogs, and to prevent a similar trouble this season the plant was removed into the Cattleya-house in August, when the spikes were about 6 inches long, and by this means the flowers opened before the November fogs set in. The plant figured had seventeen flower-spikes, and upwards of 1700 individual flowers.

The Veitch Memorial Fund.—We are informed that at a meeting of the Trustees held on the 19th inst., it was resolved that medals should be offered at the following exhibitions in 1895:—Worksop, York (Gala), Glasgow (West of Scotland Horticulural), and Edinburgh (Royal Caledonian) and that three honorary medals should be offered to the following distinguished horticulturists, James Bateman, the father of Orchid culture; F. W. Moore, the Director of the Royal Botanic Garden, Glasnevin; and to the eminent hybridist, M. Victor Lemoine, of Nancy. The trustees also unanimously voted a sum of ten guineas to the fund which is being raised for the benefit of the Lindley Library, and the preparation of a catalogue of its contents. We are requested to state that all communications respecting the Veitch Memorial Medals and Prizes should be addressed to the Secretary, Mr. A. H. Kent, 7, Doria Road, Fulham, S.W., and not to the firm at Chelsea.

The Proposed National Vegetable Exhibition.—"Will you kindly permit me," says Mr. A. Dean, "to inform readers of the *Gardeners' Chronicle* interested in the above object, that matters are now assuming a somewhat definite shape. The promoters found the Crystal Palace barred against them because of the space needed by the African exhibition of the ensuing season. They then interviewed the authorities of the Royal Aquarium, Westminster, a very central place, and practically the only available one in London for a large show, with so much success that, subject to future agreements by the general committee, the show will be held there on three days of the second week in September next. A schedule of a very representative kind, covering both Potatos and vegetables generally, has been prepared, and slips are being issued to the seed trade and others in the hope that they will so far help the promoters by offering the prizes in many of the classes as to insure the financial success of the show. Naturally for a National exhibition, special trade classes are undesirable, and therefore it has been resolved to have a schedule of classes that is representative and national. Cards of invitation to all those sixty persons or firms who consented to become members of the general committee, are being sent out to attend a meeting at the Royal Aquarium on January 15 next, when it is hoped arrangements so far made will be confirmed, and an executive committee appointed to carry out the exhibition." *Alex. Dean, Hon. Sec.*

The Gardeners' Royal Benevolent Institution.—"At a meeting of my committee held on Friday last," writes the secretary, "their attention was drawn to the letters regarding this institution, which have recently appeared in your columns, viz., that on the 15th inst., and signed 'Enquirer,' and to the three which appeared in your issue of December 22. The committee instructed me to ask you to do them the favour of inserting the following reply to Mr. Clayton's courteous remarks, they declining to notice the two anonymous communications, whilst Mr. Cannell's letter seems to deal with the system of voting in connection with the election of pensioners, which has now been in vogue since the institution was established. If Mr. Clayton will kindly refer to Rule III., sub-section 2, he will there find it stated, that a candidate is eligible for election if he has been a gardener, market-gardener, nurseryman, or seedsman, for a period of not less than twenty years, &c., and Mr. Clayton will kindly notice also that no mention is made as to when the twenty years shall commence, and he, as an old friend and supporter of the institution, would, I am sure, be the first to admit that the Committee are bound to act according to the rules, as to the admission of candidates. With reference to the particular candidate referred to in Mr. Clayton's letter, although no name is mentioned, the Committee have no doubt it is the case of Thomas Bannister. This candidate's original 'Application Form' was duly signed by subscribers to the Institution, and the necessary certificates being all in order the Committee could not do otherwise than accept him as a candidate, and he polled at the last election 873 votes, all of which were given to him in the ordinary way by subscribers, over whose votes the Committee had not the slightest control whatever, the voting papers properly marked having been sent in to the scrutineers on the day of the election in the usual manner. A short time since in accordance with the usual custom, and in anticipation of the election to be held in January next, the cases of old candidates came again before the Committee for review and consideration. When Bannister's case was reached, the question was raised as to his being a proper candidate, various reports having come to the Committee, a sub-committee was at once appointed, consisting of three practical gardeners, to make personal enquiries into the case and report to the general committee. Unfortunately, one of those gentlemen was too ill to attend when the sub-committee met, but the other two, viz, Messrs. J. Hudson of Gunnersbury House, and S. Osborn of East Sheen Lodge, who had made full enquiries, reported to the general committee that they found the candidate eligible according to the rules, and recommended that he be retained on the list. What else, therefore, could the committee do except to allow him to continue to be a candidate? I should like to point out that the committee have no power to at any time depart from the rules, which were revised two years ago, and adopted, as they now stand, after very careful consideration, at a special general meeting, and subsequently confirmed at another

special general meeting, to both of which meetings every subscriber to the Institution was summoned. I may add, too, that the particular rule under which Bannister became a candidate is exactly similar to that in the old rules, and all candidates have for many years past been admitted as such under the same rule as it now stands. If it is thought that this rule, or any other rule, is not satisfactory, it is within the power of any of the subscribers to propose any alterations they think would be advisable, and the committee would heartily welcome any proposed change if it would be likely to benefit the Institution in any way. It is, perhaps, hardly necessary to say that any alterations or amendments could only be made at a special general meeting duly summoned for the purpose in accordance with the terms stated in rule 6. In the meantime the committee trust that all friends of the Institution will give them credit for doing their utmost not only to interpret the rules correctly, but also to carry out their meaning faithfully. *George J. Ingram, Secretary*, 50, *Parliament Street, London, S.W.*

Royal Botanic Garden, Glasnevin.—The annual report of the Director of the Science and Art Museum, Dublin, for 1893-94, includes an account of the condition and progress of the gardens under the direction of Mr. F. W. Moore. Large and valuable collections of Ferns have been presented by E. J. Lowe, Esq. Other donations have been received from Mr. Neil Fraser, W. E. Gumbleton, Esq.; Thos. Acton, Esq.; Baron Schroder, and J. T. Poë, Esq.; besides numerous exchanges with other gardens and with the nursery trade in this country and abroad. Mr. Moore repeats his sense of the absolute necessity for a house for succulent plants and one for tropical Ferns.

Hooker's "Icones Plantarum." — The November number contains lithographic illustrations of numerous plants, mostly of purely botanical interest. They represent plants recently determined in the Kew Herbarium or elsewhere. Some would be valuable additions to our stoves, whilst others are remarkable for their medicinal properties, such as Pilocarpus microphyllus, a "new Jaborandi;" Tabernanthe iboga, an Apocynaceous plant from West Tropical Africa, and which has a large bitter root, to which powerful febrifugal and other properties are attributed; Carpodinus uniflorus, Stapf., an Apocynaceous climber, also from West Tropical Africa, and which yields "very fine india-rubber;" Willughbeia firma also yields a good rubber in Sumatra.

Fig. 103.—Viscum indicum: Indian Misleto. (Pleurothallis sp.) after de L'Obel.

Scottish Meteorology.—The *Journal of the Scottish Meteorological Society*, with tables for the year 1892, has reached us. It contains most valuable records on many subjects of the greatest interest to meteorologists and cultivators, such as the tables and coloured maps showing the amount of rainfall in each month of the year for twenty-five years, 1866 to 1890. In Scotland, the temperature rises from February to July, and falls from August to January. During the six months when the temperature is rising, the proportionate amount of rainfall is 3 per cent. greater in the eastern than at the western stations; but during the six months when the temperature is falling, the amounts are 3 per cent. greater on the western side.

Gas-heating for Greenhouses. — At a meeting of the Manchester District Institution of Gas Engineers held lately, a paper was read on this subject by Mr. Chester. The paper is reported in full in the *Gas World* for December 8. The author thinks that in future if an automatic arrangement can be adopted to supply an amount of gas proportionate to the temperature outside, it will be found that gas is cheaper and better adapted than any other form of fuel for greenhouse purposes where a temperature of not more than 50° to 60° F. is required. Mr. A. D. Mackenzie, in criticising Mr. Chester's paper, says from experience that the cost of gas is quite prohibitive for anything but small conservatories or modest establishments where expense is not a primary consideration.

The next Ghent Quinquennial.—We have scarcely recovered from the excitement caused by the magnificent exhibition of 1893, when we are reminded that a similar exhibition will be held in April, 1898, and intending exhibitors are already invited to prepare and make ready New Plants introduced, or to be introduced, between 1893 and 1898. Palms, Cycads, Ferns, Orchids, Camellias, Rhododendrons, Azaleas, Tulips, Pæonies, Roses, various New Holland plants, and many others are already marked out to form classes for competition. Hybrids of all kinds and double flowers are also to be provided for. From a purely horticultural point of view, it seems like a retrograde step to encourage double flowers, though as botanical curiosities and as interesting morphological specimens, they are important.

Fruit-growing in Ireland.—We are pleased to note that at the late Waterford Chrysanthemum and Fruit Show, Messrs. Saunders of the Friars' Walk Nurseries, Cork, exhibited a fine collection of culinary and dessert Apples to the number of 150 varieties. The High Sheriff of the county also exhibited fruit. No doubt Ireland could export much more fruit than she does, whilst in the culture of flowers for early spring markets there is a great opportunity before her.

The Royal Society of Agriculture and Botany of Ghent.—The schedule for the coming exhibition, April 21 to 23, is before us. Orchids, New Plants, stove plants, Palms, Cycads, Ferns, Azaleas, Rhododendrons, New Holland plants, and miscellaneous flowering and foliage plants are provided for. There are in all 217 classes, and in each class two, and sometimes three, prizes are offered. English exhibitors are at liberty to compete, and should apply to M. E. Fierens, Coupure, 135, Ghent, for further particulars.

"Cottage Gardening."—The fourth volume is before us, edited by Mr. W. Robinson, and published by Cassell & Co. At the price of ½*d.* a week, it is a remarkable production.

New Publications.—*Conspectus Florœ Africæ*, par M. Durand et Hans Schinz (Brussels Botanic Garden).—*Practical Forestry*, by A. D. Webster; second edition (Rider & Son, Bartholomew Close).—S. Mottet, *Guide Elémentaire de Multiplication des Végétaux* (Paris: Octave Doin).—Joulie et Desbordes, *Les Engrais en Horticulture* (Paris: Octave Doin).

MISLETOS OF THE OLDEN TIMES.

The common Misleto, Viscum album, was known by that name in the sixteenth century as at the present time, as reference to the works of the old herbalists will show, since in several of them the plant is so plainly described and so well illustrated that there can be no doubt as to its identity.

But these same old-time authorities admitted as varieties, or rather species, certain plants which certainly have not the least relationship, and hardly any similarity to the true Viscum, save in the circumstance that they grow on trees. For instance, in the old vellum-bound folio entitled *Stirpium Icones et Sciagraphia*, by Dominicus Chabræus, published in 1660, there is an illustration (taken from L'Obel, see fig. 103), which, though described as Viscum indicum, is clearly a drawing of a plant now known as a Pleurothallis, and is one of if not the earliest known records of a tropical epiphytical Orchid.

Fig. 104.—Viscum peruvianum: Peruvian Misleto. (Tillandsia sp.) after de L'Obel, 1605.

This is the description given by Chabræus of this Indian Misleto. As regards the names, he says distinctly that it is known as "Viscus et Viscum; Germ., *Mistel;* Belg., *Marentachen;* Gall., *Guy;* Ital., *Vischio*, Viscum indicum."

Then follow these words, descriptive of its growth on trees, and its inability to grow on the ground:—"Viscum ex eorum genere esse scribit Plinius quæ, cum propriam sedem non habeat, in aliena vivunt ac cum in terra gigni non possint, in arboribus nascuntur. Catillonem dixeris, nutrimenti alieni præreptorem Hyeme virere ex Virgilio habemus, qui ita canit: *Æneid*, vi.

Solet sylvis brumali frigore Viscum
Fronde virere novâ.

Sed de hoc Catillone in Appendice agemus. Hic tantum modo Viscum proponimus quot pingunt, & describunt Pena & Lobelius, ex Indicis plagis allatum asserentes. Admirationem certe movent foliorum veluti scalpro pressorum circuli, utrinque seni." Chabræus' figure, as he admits above, was taken from L'Obel (see *Animadversiones*, p. 452).

Gerarde, in his *Herball* (1597), gives a similar picture of this "Indian Misseltoe," which, he says, is

like the ordinary British variety, in that it "groweth likewise upon the branches of trees, running alongst the same in maner of Polypodie: the strings of the roots are like those of Couch-grasse, from which rise up divers stalkes, smooth and even, set with joints and knees at certaine distances: towarde the top commeth foorth one leafe, ribbed like the Plantaine leafe, whereon are marked certaine round eies, such as are in the haft of a knife; from the bosome whereof commeth foorth a chaffie branch, set with small leaves, which continue greene winter and sommer."

Gerarde copies from L'Obel a picture and description of what is clearly a Tillandsia, though the sixteenth century authority distinctly calls it Viscum peruvianum L'Obelii, or Misseltoe of Peru. The author was quite aware that both the Indian and Peruvian plants were "strangers in Eng'and," and the inclusion of them in the same class with the common Misleto may perhaps be accounted for by the fact that both are also parasitic, or, as we should now say, epiphytic. The illustration of the Peruvian Misleto is reproduced in fig. 104; the following is the description of it as given by Gerarde:

"There is," he says, "founde also another plant growing upon the boughes or branches of trees in maner as our Misseltoe doth, and may very wel be reckoned for a kinde thereof; the plant cleaveth unto the branches, being set thereto, as it were with the pillings of the sea Onion, for the bredth of a man's hand toward the bottome, and somewhat hollow: the tops whereof are very small and rashie, hollow likewise, & of a purple color: among which comes foorth a branch like that of Hastuta regia, or the Speare for a King, resembling the bush of Otes, covered with a white silke, such as is to be founde in Asclepias, of a salt and nitrous taste, and very unpleasant."

Thus it is very evident that in the sixteenth and seventeenth centuries, both Tillandsia and Pleurothallis were occasionally imported, yet but little known or studied. Hence it must be that various plants were included in the same class with Viscum, although quite unlike it, save in the one peculiarity common to all, of an epiphytic mode of growth.

On trying to trace Misleto still further back, we find that its history becomes increasingly obscure, and the identity of the plant known to the Romans as Viscum, is also not a little uncertain.

This fact is commented on by Dr. Daubeny in his *Essay on the Trees and Shrubs of the Ancients*, p. 130, wherein he says that—"We have additional reason for believing the Misleto of the Oak mentioned by Dioscorides to have been the Loranthus europæus, and not Viscum album, with which it has been usually identified, from finding that this plant is now called ὀξῦς, a manifest corruption of ἰξύς, whereas the parasite which grows on the Silver Fir is the true Misleto, and is termed μέλλα."

On looking to see what Pliny has to say on this subject, we find that author, in quoting from Theophrastus, "mixes up a description of the Box and the Cra'ægus, or Holm-oak, making the latter to be a seed of the former; and he then attributes a Misleto to the Box, which Theophrastus speaks of as growing on the Cra'ægus." *Bohn's Translation*, vol. iii., p. 390.

This is the confusing passage of Pliny, thus obscurely commented upon:—

"It is the Box-tree that supplies us with the greatest number of products, not only its seed, but a berry also, known by the name of Cratægum, while on the north side it produces Mistleto, and on the south Hyphear (*sic*). Sometimes, indeed, this tree has all four of these products growing upon it at the same moment." (Book xvi., c. 52) Further on, in chapter 93, Pliny mentions "three varieties of the Mistleto. That which grows upon the Fir and the Larch has the name of Stelis in Eubœa (thought to be Viscum album or Loranthus europæus); and there is the 'Hyphear' (this it is thought may also have been Loranthus europæus) of Arcadia. It grows also upon the Quercus (this, then is probably the Oak or real Misleto), the Robur, the Holm-oak, the wild Plum, and the Terebinth, but upon no other tree. Viscum album, it is well known, grows on several trees other than those mentioned. It is most plentiful of all upon the Quercus, and is then known as 'Adasphear.'"

Pliny mentions one other peculiar feature, and tells us "that which grows upon the trees which lose their leaves, loses its leaves as well; while, on the other hand, that which grows upon Evergreens always retains its leaves."

As to the utility of the Misleto, its principal modern value is as a material for making bird-lime, which, by the way, is prepared nowadays in much the same way as in Roman times.

Old writers attribute many strange medicinal virtues to our plant, and some of these were believed in up to comparatively modern times. One remedy connected with it in the days of Pliny is this:—"The viscus [*sic*] of the Mistletoe has the additional property also of rectifying malformed nails; but to effect this, it must be taken off at the end of seven days, and the nails must be washed with a solution of nitre. Some persons have a sort of superstition that the viscus will be all the more efficacious if the berries are gathered from the Robur at new moon, and without the aid of iron."

In these last words we trace the same notion which attributes to the more or less mythical Druids the use of a golden axe or knife when cutting Misleto for their mysterious ceremonies. *Leirion.*

DYED AND ARTIFICIAL FLOWERS, GRASSES, &c.

It is interesting to notice that the trade in dried, dyed, and artificial flowers, keeps pace with the demand for natural flowers at certain seasons of the year, and as the grower of flowers for market is ever on the look-out for some new subjects available for his special purposes, so the faculty of invention is constantly on the alert to devise and introduce some new feature in design and execution on the artificial side of the business. This thought was uppermost in my mind as I looked through the show-rooms of Messrs. Osman & Co., 132, Commercial Street, E., a few days since. That the trade in dyed and artificial flowers has developed enormously during the last twenty years there can be no doubt, and it has become a great and important industry. Let the times be ever so bad commercially, the festival of Christmas is observed, and to thousands of persons who cannot purchase high-priced forced natural flowers at this season, dried and dyed flowers and grasses come as a great boon, and they are employed to give a touch of festivity to many a home that would otherwise be unadorned. We have indeed advanced enormously upon the dyed Gnaphaliums and Feather-grass of forty years ago, for these were then almost the only subjects then employed, and now the variety is great, and the choice wide.

Is there an absence of the bright-berried Holly, then excellent imitations can be had in sprays—bright, cheery, and lasting, not only with green leaves, but with variegated also. Let the Holly boughs be ever so bare of berries, they can yet be had. It is so with sprays of Misleto, charming imitations are seen, very natural and with singular fidelity to Nature. Seeing that the presence of Misleto is largely confined to the south, it can reach northern parts only at some expense; and, even in the counties where it grows it is rarely cheap.

Naturally dried and dyed flowers are restricted in quantity. The Gnaphalium appears to be as precious as of old; and undyed is a somewhat spectral-looking subject; but when dyed, as it is in many colours—and there is choice of tint for all—they are very gay. It is in the great industrial centres of the Midlands and the North that these dyed Gnaphaliums are so much esteemed, where flowers at Christmas are worth almost a king's ransom. Next, perhaps, comes the Helichrysum, also dyed in many bright hues, the Rhodanthe and the Acroclinium, with the Cape flower, a form of Helichrysum that is used very extensively, and especially as the groundwork of wreaths, crosses, &c.

One of the most delightful of artificial blossoms is that of the Fairy-flower, ingeniously formed of silk, and looking for all the world like a finely-developed quilled German Aster. They are usually in a few soft and delicate tints, and placed on stiff stems are very attractive in large and small bouquets, and they can be employed in various ways; heliotrope, salmon pink, soft scarlet, white, and yellow are delightful Natural flowers dried by certain processes, and thereby rendered somewhat persistent are rare, and probably their duration is uncertain.

But if natural dried flowers are scarce, the void is filled by the many beautiful grasses now used to so large an extent. Foremost is the Vera grass, with its bold and striking tree-like plumes, now very largely imported and dyed in various tints: salmon pink, canary, autumn tints, a combination of red, orange, golden brown, shades of green, pink, and magenta, the newest being heliotrope, as fashionable in artificial flowers and grasses as in those of nature; and next in importance is the Pampas Grass in magnificent plumes, undyed, and dyed in various colours. Some novel Japanese and African grasses are strikingly handsome; the latter are from the Congo, some in rich, dark colours, and some delicately silky; they include the "Elephant" and "Congo" reed grasses. Barley and Oats are seen dyed in very pleasing colours, one being a bright bronze. Eulalia, Bromus, Briza, Erianthus, Lagurus, Panicum, and others, with dyed forms or the Feather grass in abundance.

Grasses and fairy flowers are greatly employed in making up bouquets large and small; they can be seen in many sizes fitted for the baronial hall and the cabin of the peasant. Christmas bouquets are made up in various designs in enormous quantities, so pretty and attractive, and formed of materials our forefathers never dreamed would be employed for the purpose, bouquets that can be sold retail for something like a shilling; sea-weeds dried and dyed are in use for epergnes, and in various ways.

A very striking feature are bouquets of different patterns in which natural foliage, dyed and rendered lasting, is employed; here a vigorous growing Selaginella and other sprays are mingled with Pampas Grass, Bullrush, Bromus, Japanese and African Grasses, with a leaf of Palm at the back; in the foreground being a few pretty fairy flowers. Such bouquets make very handsome Christmas presents, because of their great decorative value.

Then there are baskets formed of various materials, in different shapes and styles, some handsomely gilded, some of chip, and some tiny ones of Raffia and other materials. These are filled with grasses and flowers, some are of great size, and fitted thus for certain bold purposes; others are doll-like because so small, and yet very pretty. Fancy pots, and various designs in porcelain and glass are manufactured for holding flowers, and there are wreaths, crosses, &c., in abundance. Wreaths formed of showy Cape flowers have, in addition, sprays of foliage and blossom, formed of some chaste textile material, being also clever imitations of popular flowers. The material is so varied that there is ample choice, and it must be confessed this particular industry has reached immense proportions, as surprising as interesting. Let us hope the awful coloration of some of these objects may be improved in future. *R. D.*

HOME CORRESPONDENCE.

TROPÆOLUM SPECIOSUM.—This flame-flowered Nasturtium is somewhat peculiar in its likes and dislikes as to situation and soil. It is impossible to grow it well in soil that is light and liable to drought, aggravated by a warm southern exposure. Where the roots are growing in a cool and moist situation, the top-growth may ramble away in the full sunlight, and under such conditions, this showy subject positively revels in growth even in a dripping season like the present. I never saw it more at home than it is at Basing Park, near Alton. Growing amongst hardy Ferns on a rockery facing east, it entwines itself around the fronds, and extends its

clinging growth to Irish Yews and other dark-coloured evergreens growing near. The brilliant red blossoms, freely produced, make a grand contrast to the surroundings. Some fine examples of Athyrium filix-fœmina cristata are being entwined by the coils of this Tropæolum, and the crested part of the fronds just peeping out of the tangle have a fine effect. The soil is heavy, and therefore cool and moist. *E. M.*

GRAPE FOSTER'S SEEDLING.—Generally we see this Grape carrying a heavy crop of fruit. It is undoubtedly the one variety that may be heavily cropped with impunity, for shanking by reason of the heavy strain upon the canes from excessive cropping appears unknown. Upon a five-year-old cane Mr. Smythe, at Basing Park, has twenty-eight bunches, which may be considered an exceptionally heavy crop, many of the bunches weighing 2½ lb. Mr. Smythe speaks highly of this Grape for its free-bearing qualities, and, judging from the appearance of the Vines generally, he has a right to speak of them so. *E. M.*

ATTENDANCE AT FLOWER SHOWS.—When we realise the enormous attendance of the public at the Smithfield Club Cattle Show, it is but natural we should ask why is it so difficult, at either the Agricultural Hall or at the Crystal Palace, to induce the public to attend at great flower and fruit shows? Perhaps a large portion of the cattle-show visitors come for the purpose from the country; but in any case, without bands of music or any other attraction the inhabitants of London visit the Agricultural Hall in tens of thousands during the cattle-show week. Does this diversity arise from the fact that English people seem always to have a natural liking for the animal creation? Horse, dog, poultry, cat, and similar shows always seem to attract largely. But the metropolitan public seems to have a very poor appreciation for things vegetable as found in plants, flowers, fruits, and vegetables, although all are so beautiful and attractive. It is true that the Temple Show in May is now largely attended, but then everyone knows that this attraction has become somewhat a place of fashionable resort, a charming promenade, where the wealthy and the idle may kill time. The November show of the National Chrysanthemum Society is usually largely attended, but then there is at the Royal Aquarium such a wealthy, sensational entertainment [!], that it is no wonder the place is usually full, even when there are no flower shows. Is it possible to do anything to create in the public that same desire to see flower and fruit shows that is seen in the case of animal exhibitions? As a fact, the love for flowers and fruit is happily great; but the difficulty seems to lie in getting the people to patronise them as exhibition elements. I do not find there is in London, for instance, any greater taste for meats than for fruits or flowers. Possibly the reason for the difference in patronage is found in the fact that certain exhibitions have become established facts, and are as such recognised and patronised, whilst others are neither permanent nor even frequently held. That it takes a long time to secure the patronage of the metropolitan public for particular exhibitions is no doubt true; for that reason, flower, fruit, or vegetable shows once started need to be persisted in, and eventually they become successes. That is no doubt one reason why the Temple Show is now so largely attended. Perhaps persistence with a great autumn show would lead to a similar success in London. *A. D.*

PRICE OF FRUIT.—What is the use of long palaver, and strong personalities? However they may ramble, they never meet the point at issue—which is that of price. From the best salesman in Covent Garden I have just received an account of my last despatch for this year: 59 half-bushels of Josephine de Malines (admittedly the best winter Pear) sold for 59*s.*; net amount, £2 10*s.* 6*d.* These were carefully packed in his own baskets, and delivered by van at his place, all sound fruits, but small of course, as that variety always is. Now this is nothing very wondrous, and I have had many sales even worse. I have abused no one—as you will, I think, confess—throughout this long controversy. If people can make fruit-growing pay—*non invideo miror magis.* I speak only of my own experience, and can prove everything I have said, and my only motive has been to save poor credulous folk from heavy loss. A venture in literature costs nothing, except a few pennyworths of pen, ink, and paper; therefore, I would not discourage even Mr. Wells from girding up his loins. But an investment in fruit-growing is a very different thing. Your correspondent, "Market Gardener," in a most impartial letter, sets down all expenses at the lowest figure, and makes no allowance for misfortunes, or even the value of the land; yet at least seven years of loss must elapse before his pupil turns a penny upon current expense. And when he gets his £16 per acre—about a quarter of the profit that Hops used to bring—how much of it will be due as interest on outlay? A vast deal of nonsense is talked about "grading" fruit, boxing it, &c. All that has been tried; it is "as broad as it is long." A good even sample, well packed in half-bushels, is better value than boxed stuff, which savours of importation. Even greater folly is the talk about desiccating, preserving, &c. "I do not want peel or squash, I want fruit," says the ordinary John Bull. *R. D. Blackmore.* [This correspondence must now cease. Ed.]

THE CROPPING OF VARIOUS PEAS IN 1894.—The season of 1894 being the opposite of that of the previous year, it may be of interest to record the behaviour of some varieties sown in our garden. The first sowings were made on a south border, and the varieties sown were Sutton's May Queen, Lightning, and Chelsea Gem, which were sown at the same date, and treated exactly alike. May Queen was ready first, and was followed in about two days by Lightning, and that one by Chelsea Gem. May Queen is a very good Pea, with a Marrowfat flavour, but the pods do not fill well, and although they have a plump appearance, few seeds are found in a pod. Lightning is a well-known variety, which cropped well, but Chelsea Gem gave the best returns, had Peas of excellent quality, and proved to be one of the best earlies for frame culture or out-of-doors. Exonian did remarkably well, but this variety being much like William I., it is not necessary to grow both. This remark also applies to Duke of York and Duke of Albany, there being little difference between these two, except in height. It is, I believe, said to be an earlier and dwarfer form of Duke of Albany; it certainly is a little earlier, but not three weeks. Daisy was disappointing; it cropped fairly well, but the growth was not kindly; but that may have been due to the weather, which was changeable. So few seeds of the variety Satisfaction germinated that I cannot say much about it. Prodigy, a grand Pea generally, was not good, the growth was not satisfactory, consequently the crop was light, and although manurial aids were afforded, the plants did not respond. Telephone was not so good as in some seasons; Duchess of Edinburgh cropped very well indeed, but it grows a little too tall. Two newer main crop varieties are Sutton's Eureka and Veitch's Main Crop Peas, somewhat similar in growth and height, viz, 3 feet. Eureka has large pods with Peas of a deep green colour and good flavour, but if handsome they are not well filled. Maincrop is decidedly the better Pea in that respect, and it carries fine long pods, which are closely packed with large seeds. These two varieties were much appreciated by the cook. Veitch's Perfection I have seldom seen with a heavier crop, or generally doing better than with us last season, showing, I think, that it is still the best of its class. Ne plus Ultra maintained its good reputation. Other late varieties were Autocrat, which cropped well up to the middle of October, as also this year. Sturdy, as a late Pea, this year gave us good pickings, and is a good dwarf variety. With these two last-named varieties the Pea season was prolonged to a very late date. The soil of the kitchen-garden consists of sandy-loam, and with the exception of the earliest crops, the Peas were sown in shallow trenches, and aided during the summer by light sprinklings of superphosphate. The distance between the rows ranged from 8 to 20 feet and upwards, for plenty of room is required if good results are to be obtained. *J. H. Slade.*

CHRYSANTHEMUM BLACK PRINCE.—I find there is already a Chrysanthemum named Black Prince in commerce, consequently I have changed the name of my variety from Black Prince to Owen's Brilliant. This is the variety to which the Royal Horticultural Society's Floral Committee gave an Award of Merit on November 27 last. *R. Owen.*

SCOTLAND.

ROYAL BOTANIC GARDEN, EDINBURGH.

Gordonia anomala.—The plant above-named is well adapted for large structures where an intermediate or stove temperature is maintained, and it will continue in flower for several weeks at this period of the year. A large plant about 10 feet in length is in flower in the Palm-house. The blossoms are single, the petals white, nearly 4 inches in diameter, and show themselves conspicuously against the leaves of dark green. It is a native of tropical and subtropical Asia, and is also known under the name of Polyspora axillaris. A figure under this name may be seen in the *Bot. Mag.*, t. 4019.

Melastoma malabathricum.

Planted out this species attains a shrub-like appearance, a small plant, having since the spring of this year reached an height of about 7 feet; and considering the beauty of the flowers it is certainly deserving of being better known. The flowers, which are produced terminally upon the short branches, are of a dark purple colour, and unlike some plants belonging to the order Melastomaceæ, they last for several days after expanding. The foliage is in colour light green, and possesses the prominent veins common to the order. Although introduced from the East Indies during the latter part of the last century it is still not common in gardens.

Acacias.

Of the earlier flowering Acacias, A. Latrobei and A. imbricata are among the handsomer species. The former is of a graceful free-flowering habit, with short phyllodes; and the solitary flower-heads are produced for a good length up the short branches. The latter species is similar, but it is of a more erect habit and at the same time looser in the branching, the phyllodes being larger. The yellow heads of flower remain a considerable time upon the plant. Another pretty species now flowering is A. discolor, of stiff habit, bipinnate foliage, and large heads of flowers. *R. L. Harrow.*

AMATEURS' COLUMN.

MOUTAN PÆONIE.—A correspondent recently spoke of these as not of such value as the herbaceous varieties. May I be allowed to say that I think them even more grand as border or shrubbery plants, besides the immense and often very brilliant flowers, the varied tints of the foliage, are singularly ornamental—nor are they delicate if kept from the morning sun; also deep trenching and heavy manuring are recommended. I have grown these and the herbaceous sorts for about thirty years, and have never dug in manure with the soil before planting, finding that they grow quite strong enough without it, and flower better. Mr. Lambert says there are 100 varieties of Moutan. Years ago there were as many as that, so I thought it best to refer to the Messrs. Kelway's Catalogue, who fairly revel in producing new and extra-fine deviations from the old sorts, and I find four quite new, five nearly, and three less so; then fifty fairly new, and 150 of various dates of production, thus giving a grand total of over 200 to select from; and I would strongly advise those with garden-room, proper soil, and aspect, to try a few, and they will find, I am sure, their plots of flower-decked ground more pleasurable than ever; and I may add, that I am greatly surprised that they are not more sought for and extensively grown, combining, as they do, so many excellent qualities as flowers or shrubs. *Harrison Weir.*

HARDY FLOWERS FOR AMATEURS AND VILLA GARDENS.—This is a comprehensive subject, one that is capable of much amplification. Flower-gardens, like ladies' fashions, undergo perpetual change. Something like thirty, or thirty-five years ago, when what may be termed the bedding-out mania had reached its culminating point, the grand old herbaceous plants of the past received but very scant attention at the hands of the gardener, and in many places they passed out of existence almost altogether. However, as in the affairs of men, the tide changes; and so it is with plants and flowers, those that are everybody's favourite one season are scarcely seen or heard of the next. Herbaceous plants and hardy flowers generally that were despised and cast away at one time are more popular to-day than they were at any other period in the history of horticulture. Of late, our leading horticulturists have sung loudly the praises of these floral treasures, and endeavoured to show the difference between a natural flower garden, if we may

be allowed to use such a term, and the stiff and formal style of masses of colour obtained from exotics and the carpet-beds that were once so popular. The carpet patterns obtained by massing large numbers of Alternantheras, Mesembryanthemums, and other bits of coloured foliage are passing away, and now we have beds planted largely on the mixed system, yet employing to some extent plants that are tender and susceptible of cold. When this style is properly carried out to any great extent, it entails a considerable amount of time, labour, and money, and we do not think that any bed void of flowers, however artistically arranged, can ever be so interesting as a similar-sized bed of Auriculas, Pinks, Carnations, and other good hardy flowers that are within the reach of all amateur and villa gardeners. We have no wish whatever to condemn the present or past system of massing large quantities of tender plants in what is called the summer flower garden; all the same, we wish to put in a plea for some of the hardy flowers. When very tender subjects are employed to fill the summer flower beds, they cannot be planted before the end of May with safety, or the beginning or middle of June in some localities, and the first nipping frost towards the end of September, or early in October, mars all their beauty. On the other hand, our hardy border plants will have flowers of a thousand hues all rising from mother-earth early in February in ordinary seasons. Not only will there be early spring flowers, but Flora's lovely chain will extend throughout the summer and far into the autumn; and there is another advantage which these hardy flowers have over the formal bed. From the latter the good housewife who desires to adorn her sitting-room with cut flowers cannot go with basket and scissors in hand and cut her treasures for that purpose, but in a properly-arranged hardy border, for eight or nine months in succession, there is something fresh which may be cut every day. Again, in planting flower-beds on the massing system with exotics, a fresh set of plants has to be raised every season at considerable cost and labour; after the first outlay in the hardy border very little expense has to be incurred. With these preliminary remarks, we may ask, how should the villa garden be laid out? and what sort of flowers are the best to grow? We will now deal with the first question. Much depends on the ground at command and the position in which it is placed. We do not advocate a number of small beds about the size of a pincushion, nor do we admire beds containing very sharp points, curves, or angles, but prefer a circle, an oval, or an oblong, with straight edges. In many cases the flower-garden is in front of the house, with the garden-gate opposite the front-door. In such cases the flower-garden may really be a thing of beauty. Suppose the path leads from the entrance-gate to the front-door, there might be a strip from 4 to 6 feet wide on either side of the path for flowers, divided from the other ground by espalier Pear or Apple trees; or there might be a border made round the outside, which would be a good position for hardy flowers; and sometimes the entire space in front of the house may be given up to flowers. Then there is room for a few beds to be laid out in diamonds and half-diamonds, according to the taste of the proprietor, the beds to be edged with Box, and separated by narrow paths made of gravel. There are other living plants that can be used beside Box; such, for instance, as some of the varieties of the Thrift family, Armeria vulgaris, Cephalotes, rubra, these are pretty, dwarf, neat growing plants forming charming cushions of grass-like foliage, from the midst of which rise numerous flower-stems from 9 to 12 inches high. Then we have the Saxifraga umbrosa known as the London Pride, a plant of hardy character, will do well in a smoky atmosphere, and will grow and flourish where many plants will dwindle and die; also S. hypnoides, muscoides, and others. Some of the varieties of Arabis or Wall-cress make excellent edgings, they grow very close and compact, can be kept in nice order with very little trouble, and produce a great profusion of white flowers during February, March, and April. We must not omit the Daisies, which should be grown in quantity in every villa garden. They are amongst our most useful plants for spring gardening, and they are suitable for edgings for flower beds, and in an arrangement of spring flowers they form a most important part. When, however, the plants are allowed to remain without being disturbed, they give the flower-borders a rather withered appearance, and have not that freshness about them after blooming as the Arabis, Thrift, Saxifraga, or London Pride. When living plants are not used for edgings, tiles and other dead materials may be employed. These, when nicely arranged, look neat, and give a garden a very respectable appearance. We now come to our second question: What are the most suitable flowers for the amateur and villa gardener to grow? We may divide the plants into two classes—first, annuals and biennials. The former are such as can be raised from seed and bloomed the same season, and the latter require to be sown one year, that they may bloom the next. The second class we shall mention includes all the hardy perennials that grow and bloom for a number of years. Annuals are so cheap and so simply raised from seed that they are hardly considered by some persons worthy of notice, yet they are amongst our most valuable gems; the little tiny stars of God's earth studded here and there, and shining forth with great brilliancy, and brightening up many a solitary place that would otherwise be dull and dreary. Annuals are within the reach of the most humble, and with a little ingenuity they will bloom early in spring, and by having fresh relays of plants, a succession of bloom may be maintained until the last remnant of summer has passed away. There is no difficulty in growing annuals; the danger is lest their simplicity should cause them to be overlooked. I have seen gorgeous beds of annuals that could not be surpassed for beauty by the showiest of bedding plants. Annuals are not considered worthy of a place in the flower garden on account of their weedy character, and truly they deserve this designation when cast into the ground in that careless manner which too often falls to their lot. A hundred plants are left to struggle for existence where there is only pasturage for a tenth of that number. If any other class of plants were to be treated in the same manner, and no more care bestowed on their culture, they would obtain an equally undeserved bad character. Annuals, when properly treated and cared for, whether they be sown in the autumn and bloomed in the spring, or sown in early spring and bloomed during the summer, will repay the cultivator for his trouble. A very beautiful display of flowers may be obtained in the early spring months by sowing some of our common annuals in August. If there is not room in the flower garden proper at that time, they may be sown in some part of the kitchen garden, and transplanted to the flower-beds during the months of October and November. In a favourable season they will begin to bloom early in the month of April, when they will brighten up with their simple beauty what would otherwise in many cases be bare and baren beds. *R.*

(To be continued.)

Obituary.

Lady Henry Grosvenor.—The death of Lady Henry Grosvenor removes from the horticultural world a lady who was not only a lover of plants but a worker among them. The deceased lady was a member of the Narcissus Committee of the Royal Horticultural Society, and in various ways took a practical interest in horticultural work.

Mr. Allen Harker.—The death, on Dec. 19, of Mr. Allen Harker, Professor at the Royal Agricultural College, Cirencester, is announced. The deceased gentleman was a well-informed and enthusiastic naturalist.

Markets.

COVENT GARDEN, December 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

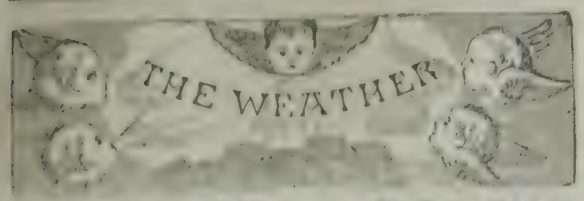
There has been, during the week, a general run on first-class Potatos at an advance of 5*s.* to 7*s.* 6*d.* per ton. The best samples off dark soils have also commanded quick sales and better prices than last week. *J. B. Thomas.*

SEEDS.

London: *December* 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report business on to-day's market inactive. Rye-grasses show some improvement, bottom prices having apparently been touched. There is no change this week in either Alsyke, Trefoil, or Red. White Clover seed, with freer offerings from Germany, shows no recovery. Canary seed keeps firm. Hemp seed unaltered. Scarlet and White Runners are strong. Other articles at this holiday season are featureless.

FRUITS AND VEGETABLES.

Farringdon: *December* 27.—Quotations:—Sprouts, 4*s.* per bushel; Celery, 10*d.* per bundle; Horseradish, 1*s.* per bundle; Cauliflower, 1*s.* 6*d.* per dozen; Parsnips, 2*s.* 6*d.* per cwt.; Beetroot, 1*s.* per bushel; Carrots, 1*s* 6*d.* dozen bun.; Turnips, 2*s.* do.; Artichokes, 1*s.* 2*d.* per half-bushel; Kale, 9*d.* per bushel; Apples, dessert, 15*s.* per bushel; cooking do., 6*s.* do.; Chestnuts, 15*s.* per bag; Pears (Californian), 10*s.* per case Onions, case, 5*s.* per cwt.; do., English, 4*s.* per cwt.



POTATOS.

Farringdon: *December* 27.—Business, as might be expected, was very quiet at the following quotations:—Maincrop, 90*s.* to 100*s.*; Sutton's Abundance, 80*s.* to 90*s.*; Bruces, 70*s.* to 80*s.*; Magnums, 65*s.* to 70*s.*; Imperators, 75*s.* to 80*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending December 22, and for the corresponding period last year:—1894: Wheat, 20*s.* 9*d.*; Barley, 21*s.* 3*d.*; Oats, 13*s.* 11*d.* 1893: Wheat, 26*s.* 6*d.*; Barley, 29*s.*; Oats, 18*s.*

The Recent Fire at Tottenham.—Mr. W. Duncan Tucker, having received so many kind letters and telegrams of sympathy from all parts of the country, is unable to answer them individually, and takes this opportunity of sincerely thanking the senders for their kind expressions.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees – a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

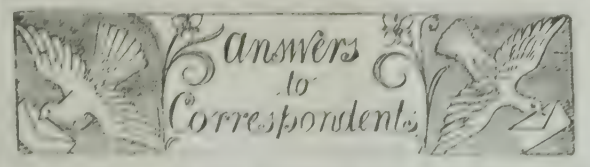
The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.



The following summary record of the weather throughout the British Islands for the week ending December 22, is furnished from the Meteorological Office:—

"The *weather* continued very unsettled over the Kingdom generally, with frequent rain—heavy at times in the West and North—and occasional intervals of bright sunshine. Very stormy conditions prevailed over the whole of the Kingdom on Saturday.

"The *temperature* fluctuated very much, but the range was not very great for the time of year. The average daily readings, however, were above the mean, the excess ranging from 2° in 'Scotland N. and E.,' to 5° over the 'Midland Counties,' 'England S.W.,' and 'Ireland.' The highest of the maxima were registered either on the 17th or 21st, and ranged from 56° in the 'Midland Counties,' and 'Ireland S.,' to 52° in our eastern districts and 'England S.' The lowest of the minima occurred on the 17th at most of the northern stations, and on the 21st in the more southern districts; they varied from 23° in 'Scotland E.,' and 25° in 'Scotland N.,' to 33° in 'Ireland N.,' 37° in 'Ireland S.,' and 40° in the 'Channel Islands.'

"The *rainfall* was rather less than the mean in 'England, N.E. and S.,' as well as in the 'Channel Islands,' and just equal to the normal in 'England, E.' and the 'Midland Counties.' Elsewhere there was an excess, especially in the north-west and north.

"The *bright sunshine* was fairly prevalent, and exceeded the mean in most parts of England and Ireland, and also in the west of Scotland. The percentage of the possible duration ranged from 29 in 'England, S.W.,' and 28 in the 'Midland Counties,' to 14 in 'England, E.' 11 in 'Scotland, E.' and 4 in 'Scotland, N.'"

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

ANEMONE "WHIRLWIND": Messrs. James Vicks & Sons, who were the original introducers of this plant, are thanked for their communication, but are reminded that the editorial and the advertisement departments are quite separate in the *Gardeners' Chronicle*.

EUCHARIS DISEASED: *Surprise.* The bulbs sent are swarming with the bulb-mite; and you had better put into the fire all similarly diseased bulbs, or, better still, the entire stock of them, making a fresh start with perfectly clean bulbs.

HYACINTH: *C. O.* The roots in some cases are decayed at the tips, and to some distance beyond, which may be due to exposing the plants to heavy rainfall, or the presence of something deleterious to the plants in the materials in which they are plunged, or the soil itself. The bulbs are otherwise sound.

LAWN SWEEPERS AND COLLECTORS: *E. W. P.* If the writer of the enquiry which appeared in our issue for last week will kindly send us his address, we can inform him of the name and address of a dealer in these machines.

NAMES OF PLANTS: *Burbach.* Cryptomeria japonica. —*G. C.* Physalis Alkekengi, the Bladder Cherry. —*Trow.* Lælia autumnalis.

RICHARDIA ÆTHIOPICA: *A. Young.* A very fine spathe.

ROSE-BUDS DAMPING OFF: *Gaucho.* We are not able in the absence of any information in your note concerning the methods adopted to say with certainty what causes the decay of the buds. Early-forced Roses require to be well rooted, and if they have been one year in pots it is a great advantage—plenty of roots, well established plants, and mature wood, being prime essentials. The first stage of the forcing, say in the first week in December, must be very gradual—by night, 45° to 50°, with a slight increase by day, increasing the warmth by very gradual steps. Bottom heat, derived from a bed of fermenting tree-leaves, is a help, but not essential. You do right to use chilled water in syringing the plants, but too much syringing is injurious in dull weather or when sunlight is lacking.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, as frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

RICHARDS' NOTED PEAT.

(Trade supplied on best terms).

To Gardeners Seeking Employment.

A PROFITABLE AGENCY is offered for an Article required by all Nurserymen and Gardeners.—Address, A. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a good WORKING MANAGER, to undertake and supervise the cultivation of a Market Garden of about 200 acres, partly Vegetables and partly Fruit. Wages of £3 per week would be paid to a capable man, with a thorough knowledge of modern requirements.—Apply, by letter, stating age, and where last employed, to A. B. Cowie & Co, 17, Gresham Street, London, E.C.

WANTED, a HEAD WORKING GARDENER, where five are employed. Thoroughly experienced in all branches; Chrysanthemums a specialty.—Apply A. F. FYNN, Penmorva, Falmouth.

WANTED, HEAD-WORKING GARDENER, thoroughly experienced in all branches, age 30 to 40; married.—Apply by letter to G., Radlett Stores, near St. Albans.

WANTED, a FOREMAN PROPAGATOR and GROWER.—Must be a pushing man, experienced in getting up first-class stuff, both General and Market, in quantity. Undeniable character and ability required, without which none need apply.—F. ROSS, The Nurseries, Mersham.

WANTED, TWO or THREE young KNIFEMEN, with good reference as to ability. State wages required to SYDNEY S. MARSHALL, Barnham Nursery, Barnham Junction, Sussex.

WILL any GARDENER kindly recommend a good JOURNEYMAN for Glass Department? Wages, 16s. per week, bothy, &c.—ROBT. DAWES, Templenewsam Gardens, near Leeds.

CAN any GARDENER recommend a young MAN that has had good experience under glass, both with fruit and plants. Age about 23; wages 21s. per week; no bothy. Required to take charge on alternate Sundays. Six are employed. Apply W. C., 41, Wellington Street, Strand, London, W.C.

WANTED, an ASSISTANT SHOPMAN in wholesale Seed Warehouse.—NUTTING & SONS, 100, Southwark Street, London, S.E.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the *highest* respectability, and *thoroughly practical* at their business. All particulars on application.
